Now it is evident again, we cannot determine both f_1 and f_2 from c, since the compression in the concrete is quite independent of the initial tension——

The only thing we can do is to determine the difference $f_2 - f_1$ from c.

Assuming the hypothesis of the conservation of plane sections, we have:

$$f_2 - f_1 = c.\ \frac{d-(t_1+t_2)}{d-x}$$

and

$$f_1 = f_2 - c\ \frac{d-(t_1+t_2)}{d-x} \quad \ldots\ldots(3)$$

substituting the value of f_1 in the equation (1) and (2) we get:

$$T = f_2a_2 + \left(f_2 - c.\ \frac{d-(t_1+t_2)}{d-x}\right)a_1 - \tfrac{1}{2}c\,(d-x)\,C$$

or,

$$T = f_2(a_2+a_1) - c.\ \frac{d-(t_1+t_2)}{d-x}a_1 - \tfrac{1}{2}c\,(d-x)\,C$$

or,

$$T = \frac{c}{d-x}\Big\{(a_2+a_1)(d-x)n - [d-(t_1+t_2)]a_1 - \tfrac{1}{2}(d-x)^2\,C\Big\} \quad (4)$$

where $n = \frac{f_2}{c}$.

Similarly we get from equation (2)—

$$B = f_2a_2y_2 - \left[f_2 - c\ \frac{d-(t_1+t_2)}{d-x}\right]a_1y_1 + \tfrac{1}{2}c\,(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C,$$

or,

$$B = f_2(a_2y_2 - a_1y_1) + c\,\frac{d-(t_1+t_2)}{d-x}a_1y_1 + \tfrac{1}{2}c\,(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C$$

or where $n = \frac{f_2}{c}$,

$$B = \frac{c}{d-x}\Big\{(a_2y_2 - a_1y_1(d-x)n + [d-(t_1+t_2)]a_1y_1 + \tfrac{1}{2}(d-x)^2\left(\frac{d}{6}+\frac{x}{3}\right)C\Big\} \quad (5)$$

and in the case of a symmetrical reinforcement we have—

$$a_2 = a_1 \text{ and } y_2 = y_1,$$

again substituting for $n = \frac{f_2}{c}$ the value

$$\frac{16000}{400} = 40,$$

and since usually $t_1 = t_2$, we get,

$$T = \frac{c}{d-x}\Big\{40 \times 2a(d-x) - (d-2t)a - \tfrac{1}{2}(d-x)^2C\Big\}$$

or,

$$T = \frac{c}{d-x}\Big\{[79d - 80x + 2t]a - \tfrac{1}{2}(d-x)^2C\Big\} \quad \ldots\ldots(6)$$

Similarly from equation (5).

$$B = \frac{c}{d-x}\Big\{\tfrac{1}{2}(d-x)^2\left(\frac{d}{6}+\frac{x}{3}\right)C + (d-2t)\,ay\Big\} \quad \ldots\ldots(7)$$

Now supposing the bending moment becomes greater and greater, it will gradually eliminate the tensile stress f_1, and at the limit when the skin compression caused by the bending moment is equal to the skin tension due to the direct pull, f_1 will equal zero, and from equation (3) we shall have,

$$\frac{f_2}{c} = \frac{d-(t_1+t_2)}{d-x} = 40$$

or

$$d - 2t = 40(d-x),$$

and substituting in the above equations (6) and (7), we get,

[*It is unusual to represent the breadth by C; but, from a misprint in setting we are obliged to leave it as it is throughout the following calculations.]

$$T=\frac{c}{d-x}\left\{40\times 2a(d-x)-40(d-x)a-\tfrac{1}{2}(d-x)^2C\right\}$$

or

$$T=c[40a-\tfrac{1}{2}(d-x)C] \quad \ldots\ldots(8)$$

similarly,

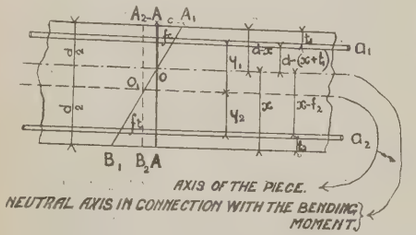
$$B=\frac{c}{d-x}\left\{\tfrac{1}{2}(d-x)^2\left(\frac{d}{6}+\frac{x}{3}\right)C+40(d-x)ay\right\}$$

or,

$$B=c\left[40ay+\tfrac{1}{2}(d-x)\left(\frac{d}{6}+\frac{u}{3}\right)C\right] \quad ..(9)$$

and

$$\frac{B}{T}=\frac{40ay+\tfrac{1}{2}(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C}{40a-\tfrac{1}{2}(d-x)C} \quad ..(10)$$



Now it is obvious that in the case when $f_1 > O$ we shall have—

$$\frac{B}{T}<\frac{40ay+\tfrac{1}{2}(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C}{40a-\tfrac{1}{2}(d-x)C}$$

therefore, when compression does not exist in the piece, $\frac{B}{T}$ will always be

$$\leq\frac{40ay+\tfrac{1}{2}(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C}{40a-\tfrac{1}{2}(d-x)C} \quad ..(11)$$

2nd Case.—Let us assume now that the bending moment is quite sufficient to eliminate the tension on the one side of the piece, and that at the bottom exists tension, while at the top exists compression; also that the reinforcement is of small sectional area and depth, and is at both sides of the piece.

Examining the section AB, we may suppose it to take up the position of A_1B_1 under the effect of the direct tension, and the bending moment where f_t and f are the tensile and compressive stresses of the metal respectively; the concrete under the effect of the bending moment will be compressed according to the triangle OAA_1.

It is evident that the direct tension:

$$T=f_ta_2-f_ca_1-\tfrac{1}{2}c(d-x)C \ldots.(12)$$

and the bending moment

$$B=f_ta_2y_2+f_ca_1y_1+\tfrac{1}{2}c(d-x)\left[\frac{d}{2}-\frac{1}{3}(d-x)\right]$$

or

$$B=f_ta_2y_2+f_ca_1y_1+\tfrac{1}{2}c(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C \quad (13)$$

by taking moments round o_1, and considering as + the clockwise moments, and as − the counter-clockwise moments.

But now it is evident that we can determine both f_t and f_c from c.

Assuming the hypothesis of the conservation of plane sections, we have:

$$\frac{c}{E_c}\times\frac{d-(x+t_1)}{d-x}=\frac{f_c}{E_f}$$

where Ec=the modulus of elasticity of the concrete in compression, and Ef=the modulus of elasticity of the metal.

$$\therefore f_c=r.c.\frac{d-(x+t_1)}{d-x} \quad \ldots\ldots(14)$$

where r=the ratio of the moduli of elasticity Ef:Ec.

Similarly we have

$$\frac{f_t}{E_t}=\frac{c}{E_c}\cdot\frac{x-t_2}{d-x}$$

$$\therefore f_t=r.c.\frac{x-t_2}{d-x} \quad \ldots\ldots\ldots(14a)$$

Substituting equations (14) and (14a) in the equations (12) and (13) we get,

$$T=r.c.\frac{x-t_2}{d-x}a_2-r.c.\frac{d-(x+t_1)}{d-x}a_1-\tfrac{1}{2}c(d-x)C$$

or

$$T=\frac{r.c.}{d-x}\left[(x-t_2)a_2-\left\{d-(x+t_1)\right\}a_1\right]-\tfrac{1}{2}c(d-x)C$$

or

$$T=\frac{c}{d-x}\left\{r\left[(x-t_2)a_2-\left\{d-(x+t_1)\right\}a_1\right]-\tfrac{1}{2}(d-x)^2C\right\} \ldots\ldots(15)$$

similarly from equation (13) we get,

$$B=r.c.\frac{x-t_2}{d-x}a_2y_2+r.c\frac{d-(x+t_1)}{d-x}a_1y_1+\tfrac{1}{2}c(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C$$

or

$$B=\frac{r.c.}{d-x}\left[(x-t_2)a_2y_2+\left\{d-(x+t_1)\right\}a_1y_1\right]+\tfrac{1}{2}c(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C$$

or,

$$B=\frac{c}{d-x}\left\{r\left[(x-t_2)a_2y_2+\left\{d-(x+t_1)\right\}a_1y_1\right]+\tfrac{1}{2}c(d-x)^2\left(\frac{d}{6}+\frac{x}{3}\right)C\right\} \ldots.(16)$$

and in the case of a symmetrical reinforcement, we have,

$$a_1=a_2 \text{ and } y_1=y_2$$

again substituting for r its usual value 15, we get,

$$T=\frac{c}{d-x}\left\{15\left[(x-t_2)a-\left\{d-(x+t_2)\right\}a\right]-\tfrac{1}{2}(d-x)^2C\right\}$$

and since usually $t_1=t_2$,

$$T=\frac{c}{d-x}\left[15a(2x-d)-\tfrac{1}{2}(d-x)^2C\right] \quad (17)$$

and

$$B=\frac{c}{d-x}\left\{15\left[(x-t_2)ay+\left\{d-(x+t_1)ay\right\}\right]+\tfrac{1}{2}c(d-x)^2\left(\frac{d}{6}+\frac{x}{3}\right)C\right\}$$

and since $x-t_2+d-(x+t_1)=2y$, we get

$$B=\frac{c}{d-x}\left\{30ay_2+\tfrac{1}{2}c(d-x)^2\left(\frac{d}{6}+\frac{x}{3}\right)C\right\} \ldots.(18)$$

Suppose now, we have a symmetrical reinforcement and want to *determine the dimensions* of a piece knowing the values of B and T.

We can follow two methods:—

1st Method.—We give a value to the percentage of the reinforcement $p=\frac{2a}{Cd}$, where 2a is the whole area of the metal to be used, and d, C the depth and breadth of the piece respectively.

Again giving to t its usual value 2ins, we get $y=\frac{d-4}{2}$; but we have also for C the usual value of 12 inches.

Therefore equations (6) and (7) become

$$T=\frac{c}{d-x}\left\{\left[79d-80x+4\right]\frac{Cdp}{2}-\tfrac{1}{2}(d-x)^2C\right\}$$

or

$$T=c\left\{\left[79d-80x+4\right]\frac{Cp}{2}\cdot\frac{1}{1-\frac{x}{d}}-\tfrac{1}{2}(d-x)C\right\}$$

We represent the ratio $\frac{x}{d}$ by μ, therefore,

$$T=400\left\{\left[79d-80\mu d+4\right]\frac{6p}{1-\mu}-6d(1-\mu)\right\} \ldots.(19)$$

Similarly we have

$$B=\frac{c}{d-x}\left\{\tfrac{1}{2}(d-x)^2\left(\frac{d}{6}+\frac{x}{3}\right)C+\frac{Cdp(d-4)^2}{4}\right\}$$

or,

$$B=c\left\{\tfrac{1}{2}(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C+\frac{C\,d\,p\,(d-4)_2}{4\,(d-x)}\right\}$$

or,

$$B=c\left\{\tfrac{1}{2}(d-d\mu)\left(\frac{d}{6}+\frac{d\mu}{3}\right)C+\frac{Cp(d-4)^2}{4(1-\mu)}\right\}$$

or,

$$B=400\left\{6d^2(1-\mu)\left(\frac{1}{6}+\frac{\mu}{3}\right)+\frac{3p(d-4)^2}{(1-\mu)}\right\} \ldots.(20)$$

Equation (19) contains the 1st power of d, while equation (20) contains the second.

Therefore, giving different values of μ (ratio of x to d, and $\mu<1$), we find one value of d from equation (19), and another from equation (20), solving both for d. We plot the values of μ on squared paper at the axis of x, and the two correspondent values of d from the two equations (19) and (20), as ordinates. The intersection of the two curves will give us the proper value of d; then the value of x is found from the equation—

$$\frac{x}{d}=\mu$$

when μ is found from the diagram.

We then determine the value of *a* from the equation

$$a=\frac{Cdp}{2}$$

and the value of f_1 from the equation

$$f_1=f_2-c\frac{d-4}{d-x}$$

where f_2 = 16,000 lbs. and c = 400 lbs.

2nd method.—We assume a value for d and C; then $y=\frac{d-4}{2}$ where t=2 in.

Equations (19) and (20) must be considered now as for p and μ.

Giving different values to μ we determine two values of p from the two equations, and plotting them on squared paper, we get two curves, the intersections of which will give us the proper values of p and μ.

Then from the equation

$$p=\frac{2a}{Cd}$$

we determine a, the sectional area of the reinforcement, and from equation—

$$\frac{x}{d}=\mu$$

we determine x.

The value of f_1 is determined from the equations

$$f_1=f_2-c\frac{d-4}{d-x}$$

where f_1=16,000-lbs. and c=400-lbs.

But it is obvious that the values of d, x, c, a, as found above, must satisfy the expression—

$$\frac{B}{T}\leq\frac{40ay+\tfrac{1}{2}(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C}{40a-\tfrac{1}{2}(d-x)C}$$

If this expression is not satisfied, we may alter our first assumptions, in either case, until the proper values are found satisfying the above expression, or we consider the case where compression exists.

2nd Case.—In the case—

$$\frac{B}{T} > \frac{40ay \times \frac{1}{2}(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C}{40a-\frac{1}{2}(d-x)C}$$

we shall have compression on the one side of the piece, and we proceed as follows.

1st Method.—We assume a value for the percentage of the reinforcement $p=\frac{2a}{Cd}$ also C=13ins. as before, and t=2ins., therefore—

$$y=\frac{d-4}{2}$$

substituting the above values in equations (17) and (18) we get—

$$T=\frac{c}{d-x}\left[15\frac{Cdp}{2}(2x-d)-\tfrac{1}{2}(d-x)^2C\right]$$

or

$$T=c\left\{\frac{15}{2}\cdot\frac{2x-d}{d-x}Cdp-\tfrac{1}{2}(d-x)C\right\}$$

and representing $\frac{x}{d}$ by μ as before,

$$T=400\left\{\frac{15}{2}\cdot\frac{2d\mu-d}{d-d\mu}Cdp-\tfrac{1}{2}(d-d\mu)C\right\}$$

or

$$T=400\left\{90\frac{2\mu-1}{1-\mu}.d.p-6(1-\mu)d\right\} \quad (21)$$

similarly

$$B=\frac{c}{d-x}\left\{30\frac{Cdp}{2}\cdot\frac{(d-4)^2}{d-4}+\tfrac{1}{2}c(d-x)^2\left(\frac{d}{6}+\frac{x}{3}\right)C\right\}$$

or putting for x the value $d\mu$.

$$B=c\left\{30.\frac{C.d.p}{2}\cdot\frac{(d-4)^2}{4(d-d\mu)}.+\tfrac{1}{2}c(d-d\mu)\left(\frac{d}{6}+\frac{d\mu}{3}\right)C\right\}$$

or

$$B=c\left\{15.C.p\frac{(d-4)^2}{4(1-\mu)}+\tfrac{1}{2}c(1-\mu)\left(\frac{1}{6}+\frac{\mu}{3}\right)d^2C\right\}$$

or

$$B=400\left\{45p\frac{(d-4)^2}{(1-\mu)}+6c(1-\mu)\left(\frac{1}{6}+\frac{\mu}{3}\right)d^2\right\} \quad (22)$$

Equation (21) contains the first power of d, while equation (22) contains the second power of d; both therefore are easily solved as for d.

Giving different values of μ ($\mu<1$) we find one value of d from equation (21), and another from equation (20); we plot the values of μ on squared paper as abscissæ, and the values of d as ordinates; the intersection of the two curves will give the proper values of d and μ; then the value of x is found from the equation—

$$\frac{x}{d}=\mu.$$

The sectional area for each of the top and bottom reinforcements is found from the equation—

$$p=\frac{2a}{Cd}$$

The stresses per square unit are found from the equations (14) and (14a), where c=400 lps per square unit of the concrete, *i.e.*—

$$f_c=15\times400.\frac{d-(x+t_1)}{d-x}=6000\frac{d-(x+2)}{d-x} \quad \ldots(23)$$

and

$$f_t=15\times400.\frac{x-t_2}{d-x}=6000\frac{x-2}{d-x} \quad \ldots(24)$$

2nd Method.— We assume *a* a value for d, C; then—

$$y=\frac{d-4}{2} \text{ when } t=2\text{in.}$$

and we consider the same equations (21) and (22) as for p and μ.

Giving different . . . . values to μ($\mu<1$), we determine, as before, two values of p determine, as before, two values of p from the two equations, and plotting them on squared paper as abscissæ we get two curves. the intersection of which will give us the proper values of p and μ_c.

Then from equations—

$$p=\frac{2a}{Cd} \text{ and } x=d\mu$$

we determine the sectional area *a* of the reinforcement, and the distance x of the neutral axis from the bottom surface.

The values f_1 and f_2 are determined from the same equations as before, *i.e.*

$$fc=6000\frac{d-(x+2)}{d-x} \quad \ldots(23)$$

and

$$ft=6000\frac{x-2}{d-x} \quad \ldots(24)$$

The values we find in either method must satisfy the expression—

$$\frac{B}{T}\gtrless\frac{40ay+\frac{1}{2}(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C}{40a-\frac{1}{2}(d-x)C}$$

Suppose now we want *to check a member* of given dimensions and symmetrical reinforcement, knowing the values of B and T.

By combination of equations (19) and (20) we get—

$$\frac{T}{\left[79d-80\mu.d+4\right]\frac{6p}{1-\mu}-6d^2(1-\mu)} = \frac{B}{6d^2(1-\mu)\left(\frac{1}{6}+\frac{\mu}{3}\right)+\frac{3p(d-4)^2}{(1-\mu)}} \quad \ldots(25)$$

Since μ is contained at its third power, we proceed to solve this equation by giving to μ several values ($\mu<1$) and plotting those as abscissæ on squared paper; we determine the values of *each member* of the equation (25), and plot them as ordinates to the correspondent values of μ. The intersection of the two curves thus obtained will give us the proper value of μ.

Then

$$x=d\mu$$

Having found the value of x, we try if equation (11), *i.e.*—

$$\frac{B}{T}\gtrless\frac{40ay+\frac{1}{2}(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C}{40a-\frac{1}{2}(d-x)C} \quad (11)$$

is satisfied, in which case we determine the values of f_1 and f_2 using equations (1) and (3), *i.e.*—

$$T=f_1a_1+f_2a_2-\tfrac{1}{2}c(d-x)C \quad \ldots(1)$$

and

$$f_1=f_2-c\frac{d-(t_1+t_2)}{d-x} \quad \ldots(3)$$

where

$$c=\frac{T(d-x)}{(79d-80x+2t)a-\frac{1}{2}(d-x)^2C}$$

from equation (6).

The value of f_2 must not exceed the assumed safe working stress of the metal per unit square; similarly c that of the concrete.

If the above-found value of x does not satisfy equation (11), we consider the second case using equations (21) and (22).

By combination of these equations we get—

$$\frac{T}{90\frac{2\mu-1}{1-\mu}.d.p-6(1-\mu)d} = \frac{B}{45p\frac{(d-4)^2}{(1-\mu)}+6c(1-\mu)\left(\frac{1}{6}+\frac{\mu}{3}\right)d^2} \quad (26)$$

As this equation contains the cube of μ we solve it as for μ, according to the method explained before, by plotting on a squared paper.

Then

$$x=d.\mu$$

and having found x, we determine the value of c from equation (17).

$$c=\frac{T(d-x)}{15a(2x-d)-\frac{1}{2}(d-x)^2C}$$

and then the values of f_t and f_c from equations (14) and (14a).

$$fc=15.c.\frac{d-(x+t_1)}{d-x}$$

and

$$f_t=15.c.\frac{x-t_2}{d-x}$$

In cases where we assume other values of n, c, and r, our equations must be altered accordingly.

The above explanation of using the formulæ was made for symmetrical reinforcement. When the bending moment is caused by a dead load, and is not small in comparison with the direct stress, we may apply a non-symmetrical reinforcement in order to take full advantage of the compressive resistance of the concrete and thus save metal. In this case the mode of procedure is similar to the above, and the general formulæ given may be used.

THE INTERNATIONAL COMMISSION ON REINFORCED CONCRETE.

The International Commission on Reinforced Concrete met at Bâle last week under the chairmanship of Professor Schule, of the Zurich Technical College. The primary objects of the Commission will be to (a) prepare a summary of tests completed in different countries; (b) prepare a summary of the facts definitely established by these tests; (c) prepare a summary of the chief causes of difference of opinion on questions relating to reinforced concrete; and (d) prepare a set of standards for future tests. It is hoped to complete the work under point (a) in time for a report to be presented at the next meeting, which is to be held at Copenhagen in September, 1909, on the occasion of the Congress of the Association of Testing Materials. A sub-committee was appointed to make preliminary studies regarding standardising the algebraical notations and standardising the methods of testing, and the sub-committee comprises:—Messrs. Melan (chairman), Mesnager, Rutgers, Sachs, and Schule.

The interest in reinforced concrete having increased in Great Britain since the constitution of the International Commission, it was proposed by Mr. Edwin O. Sachs that the British representation be increased by a representative of the Concrete Institute and a representative of one of the public authorities concerned, and arrangements are being made accordingly.

It is understood that the representation of the United States will also shortly be increased.

The death took place on the 25th ult. at Wrexham, of Mr. Gwilt Cathrall, a large builder and contractor. Mr. Cathrall, who was 80 years old, was a prominent Freemason, and had been a member of the Wrexham Town Council.

FORMS FOR REINFORCED CONCRETE.—IV.

Arch Centers.

(Concluded from p. 525, No. 698.)

With reinforced concrete for structures in arch form large spans have usually to be dealt with. Arch construction is most often adopted for bridges, and the forms for such work are heavy, entail considerable labour, and are often very expensive items. In general design and construction forms for arch-bridges are substantially the same as centers for masonry or brickwork arches, and the main supports are designed according to the same principles and in the same way as for them. In some types of reinforced concrete bridges heavy sections of steel, either in the form of joists bent to curve, or framed lattice girders are adopted, and these have sufficient resistance to sustain a part of the load, so that the centering can be partly suspended therefrom, and partly built up independently from below to support the superincumbent weight of the material and other weights placed upon it in course of construction. The use of heavy steel reinforcements framed together is not so customary as it was a few years ago, and, in the majority of cases, reinforced concrete arch-bridges are constructed with steel in small sections, and the centering has to sustain the whole of the load.

One of the first obvious points of importance is that in framing up the centers allowance should be made for their settlement, also for the deflection of the arch after the removal of the centering, and for securing a permanent camber. Mr. Edwd. Thatcher, Am.Soc.C.E., who has had very great experience in the construction of reinforced concrete arch-bridges, states that the centers should be framed for a rise of the arch greater than the rise marked on the drawings by an amount equal to 1/80oth. of the span.

Another obvious requirement is that in striking the centering this should be done very gradually by means of folding wedges, so that they drop only a small way. In this manner it can be ascertained whether the work is sound, and that no error has arisen that may render the bridge dangerous. The centering, of course, has to be arranged to lower clear of any projection upon the abutment piers.

The lagging round the centering to sustain the soffit of the arch ring should be dressed to a uniform thickness, so that when laid it presents a smooth surface. This is perhaps the most economical method of securing a proper finish to the work; to execute the work roughly, and attempt to plaster it afterwards would be folly, for, in the case of work of any magnitude, it is almost impossible to do this, at any rate, with economy. In certain cases, however, the lagging has not been made of carefully dressed timber, and the smooth surface has been given by plastering over the center, or depositing wet clay thereon. Such attempts are, in our opinion, unadvisable, and very seldom result in economy. Mortar covered with thick paper, or with cloth, has also been used; even with dressed lagging it is a known practice to employ oil paper, or a cloth covering, for the purpose of preventing adhesion between the concrete and lagging, which might disturb the ready striking of the centers. This is preferable to the use of soap or oil smeared upon the lagging, such as is often adopted for floors. The work is so much larger that such means are not, as a rule, so satisfactory as oil paper. Where arches are ribbed the soffit mould requires more elaborate work than is the case with masonry arches.

For striking centers folding wedges are not always sufficient. Sand boxes should also be used in work of large size; they will allow of a gradual lowering of the arch if they are protected from becoming wetted with dirty, clayey water, or water containing lime or cement. The boxes should be thoroughly watertight and sealed against the entrance of any extraneous matter. The sand in the box, too, it may be noted, will become compressed, and, therefore, an allowance requires to be made for this, otherwise serious trouble may arise; indeed, in certain circumstances, sand boxes, for this reason, should not be favoured.

Fig 45 shows the centering for a bridge over a creek, and Fig. 46 the centering for a very similar bridge of exactly the same span, namely, 80ft. In the former, the piles were driven into the hard pan and sawn off about 2ft. below the arch soffit; transverse caps were laid with folding wedges on each pile head, and carried the ribs of the centering, which were placed near together, braced apart with transverse bracing, the ribs being covered with transverse lagging. In both these arches the reinforcement consisted of lattice framed girders. In the second bridge the posts carried timber bases, which rested on concrete footings. Wedges over each post provided means for striking the centering.

Fig. 47 shows the centering for another Melan bridge, which, it will be seen has eight ribs, spaced about 7ft. apart, and braced together with diagonal battens, each rib resting on seven piles, and each carrying a sand box. The upper members of the ribs were cut in the middle of each panel, and here rested on cross tim-

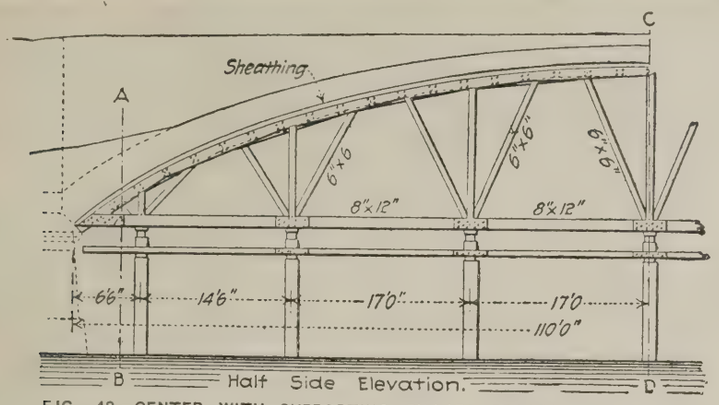

FIG. 48.—CENTER WITH SUPPORTING PILLARS BRACED TOGETHER.

bers "AA" hung from the steel reinforcing ribs by means of hangers, as shown in Fig. 47A. By these means about half the weight during construction was carried by the steel ribs and half by the centering.

Fig. 48 shows another interesting centering, for a bridge in which the supporting pillars are shorter and braced together. Details are clearly shown in the diagram.

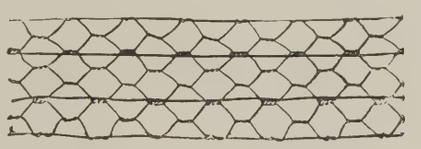
(To be continued.)

INTERCEPTING TRAPS IN HOUSE DRAINS.

L.G.B. Enquiry.

The President of the Local Government Board has appointed a Departmental Committee to inquire and report with regard to the use of intercepting traps in house drains, and this committee will shortly be prepared to receive evidence on the subject from medical officers of health, engineers, architects, and others having special knowledge of it.

With a view to assisting the committee to select witnesses for this purpose, a circular has been addressed to the town clerks of the principal towns of England and Wales, asking in each case whether the officers of the town council would be prepared to give evidence should the committee so desire. A précis of the evidence they would propose to tender should be forwarded not later than November 21st, to Mr. E. Hardwick Terry, secretary to the committee.



It is added that the committee are of opinion, at present, that their terms of reference will involve consideration of the need or otherwise of the intercepting trap; of any disadvantages of the trap; of the effect on the community of emanations from sewers or drains; to some extent also of the ventilation of sewers and drains; and of the bearing of existing conditions on the question.

The Committee consists of Mr. Ludovic William Darra Mair, M.D.; Mr. Allan Arthur Grenville Malet, M.Inst.C.E.; and Mr. Harry John Pearson, A.R.I.B.A.; Dr. Mair being chairman, and Mr. Edward Hardwick Terry secretary.

Mr. Edmond Coignet, engineer, of 20, Rue de Londres, Paris, and of Edmond Coignet, Ltd., 20, Victoria Street, London, S.W., has been awarded the "Grand Prix" in Class 28, French Section, Machinery Hall, at the Franco-British Exhibition, for his exhibit in connection with the Coignet system of armoured concrete.

MONOLITHIC BRICKWORK.

This is the title of a catalogue which has been issued by Messrs. Richard Johnson, Clapham and Morris, Ltd., of 24 and 26, Lever Street, Manchester. Mr. W. H. Brown, M.S.A., recently invented a strip of woven wire reinforcement for placing in the joints of brickwork, and his patents have been acquired by the above firm, systems of construction to which they are applicable being shown in this catalogue. Mr. Brown carried out a number of tests upon walls reinforced with his woven wire strip

"H.B." BRICKWORK REINFORCEMENT.

meshwork, called "H.B." reinforcement, which were instructive, and showed clearly the advantages which are to be derived from the reinforcing of brickwork, the principle of which has been known for many years, but have not had an extensive application. Mr. Brown claims to have found that hoop-iron, the ordinary form of reinforcement for brickwork, is not always advantageous, because it is deficient as regards adhesion to the mortar, and slips or pulls through, unless special means are taken to give a mechanical bond. It will be seen from the view of the "H.B." reinforcement which we reproduce herewith, that not only do the wires run in one direction, so acting in tension throughout, but they interlock with the mortar, giving a thoroughly secure mechanical bond, while, at the same time, a pull in tension tends to close up the meshes, thus resulting in the compression of the interlocked mortar which that material is best capable of sustaining, not possessing great tensile strength.

"H.B. reinforcement" is made in two widths, 2in. and 2½in., and is composed of wire tested to 32 tons per sq. in. The use of a reinforcement in the joints of brickwork increases the strength immensely, and walls of almost any height can be constructed of a minimum thickness between piers and other upright supports, the thickness being determined solely in respect of resistance to weather, heat, and cold. For instance, a wall can be built brick-on-edge, self-sustaining like a beam, and with great lateral resistance beween piers up to almost any height. Of course, the by-laws in many districts require the thickness of the walls to be increased proportionately to their height, but with reinforced brickwork construction there is no necessity for this.

The system of construction invented by Mr. Brown has received considerable application, although it has only recently been placed upon the market, and is likely to be very extensively used in the future. The catalogue is extremely well produced, with a number of photographs and details of the construction of brick-on-edge, half-brick, and cavity walls, while another application of the principle is shown in respect to the clothing of reinforced concrete and steel frame structures. Although reinforced concrete external walls to buildings have been built often enough with advantage and economy, yet, as a rule, it is cheaper to use brickwork when the walls have to serve virtually as a partition between the pillars merely to keep the weather out. The same thing applies to steel frame buildings, where, again, the brickwork is carried at each floor independently upon the beams and the columns. The difficulty is to unite the brick intermediate walls with the steel or reinforced stanchions or posts; some key is required, and Mr. Brown has devised an application of his "H.B. reinforcement" which is distinctly advantageous in this respect. Short pieces of the meshwork are embedded in the concrete surrounding the steel (to protect it against corrosion), and these pieces are lapped into the joints with the other longitudinal strips running the whole length as the brick-wall rises, thus the whole is tied together, and adequate stability obtained. The economy effected is not only very great, but such a system of construction, where hollow walls are used, is, in our opinion, superior to the ordinary solid brick-wall construction. The same method of leaving strips of the meshwork projecting from the concrete is applied in bonding facing bricks to a concrete wall, such as in a swimming pond or for basement walls.

It will be gathered that the catalogue under notice is of more than common interest and importance.

The Junior Institution of Engineers held its annual general meeting at the Royal United Service Institution, Whitehall, on October 19th, the chairman, Mr. Frank R. Durham, Assoc.M.Inst.C.E., presiding. Salient features of the council's report relating to the year 1907-8, which was presented and adopted, included reference to the increase in the membership roll, bringing the total to 1,042; the election of Mr. James Swinburne, F.R.S., as president in succession to the late M. Gustave Canet, and the election as vice-presidents of Sir William Huggins, K.C.B., O.M.; Sir Archibald Geikie, K.C.B.; Sir Robert A. Hadfield; and Professor J. J. Thomson, F.R.S. Nine meetings for the reading and discussion of papers and thirty-eight visits to engineering works, etc., had taken place, with an average attendance respectively of 116 and 74. Mr. Durham had been awarded the Institution medal for his paper on "The Design of a Sewer," and a bronze medal (the Junior members' award) went to Mr. Gilbert Whalley for his paper on "Notes on the Testing of Gas Engines." Special reference is made to the foundation of the Durham Bursary, due to the kindness of Mrs. F. R. Durham. The award for the year 1908-9 went to Mr. L. M. Jockel, of Edinburgh, his thesis being on the subject of "Electricity in Mining."

CALLING FOR ESTIMATES.

Architects and engineers in calling for tenders from steelwork and reinforced concrete specialists often cause a great deal of annoyance and unnecessary labour by the undue stringency of their requirements; they ask for too great an amount of detail. They should remember that the specialist firms are, by the customary contracting system, called upon to design in competition with each other, so that for each job there are many designs prepared. We see no means by which this duplication of work can well be avoided, but the contractors can estimate from pencil drawings without such elaboration as is necessary in the preparation of drawings for submission to an ordinary client. There is no reason, in the majority of cases, why an architect or an engineer should require drawings to be submitted at all; and even when he does these need only to be sketchy. As soon as the tender had been provisionally accepted, complete drawings could be called for, and the ultimate acceptance withheld until these were approved as satisfactory. To require more is to waste labour, and by increasing the establishment expenses of the various firms make work dearer for the clients. The amount of time and labour that has been lost on one job must be made up on another. Architects and engineers, in dealing with reinforced concrete and steel-work, seem often to be oblivious to the amount of work that is entailed. We have known of schemes hanging fire for months—perhaps years—suddenly rushed by the clients, and when tenders are requested proper time cannot be afforded for estimating. It should be remembered that the specialist, like the architect or engineer, requires time to carry out his work well. Very often jobs are unduly rushed, and the engineering staffs of specialist firms work at high pressure, which is ultimately a detriment to the efficiency of the construction, and to general economy. There ought to be more system, too, in the way in which tenders are called for. Little or no attention is given to requiring the designs and tenders to be submitted upon a fair and equal basis, and the result is that firms are encouraged to take risks and scamp materials and labour so as to under-cut each other. It would be desirable to consult an independent specialist before giving work out to tender, to draw up the lines upon which the designs are to be prepared; limiting stresses, etc., and providing for a guarantee of efficiency. Confirmation of these requirements should be stipulated, except where the job is of sufficient size to warrant the independent specialist or consulting engineer overhauling the designs when submitted, and checking the calculations. Architects and engineers who go in for haphazard methods in calling for designs and tenders, little know the grave risks that are often run. It is only right and proper that they should throw their work open to a firm who shows itself able and willing to undertake the work: and designers view the problems very differently, so that competition is as advantageous in this field as it is in any other. But if architects insist upon a proper drafting of conditions, and the appointment of a qualified assessor in their own architectural competitions, they should adopt the same procedure in reference to the competition among their specialist contractors. We have not yet arrived at the stage where Consulting Engineers prepare designs for work in reinforced concrete, and, indeed, it is doubtful whether we ever shall have the work carried out in this way. Steelwork is not so designed, as a rule, and even in other branches of engineering, such as bridge work, shipbuilding, and electrical engineering, firms submit designs and tenders for works of great magnitude. The reason is that we all recognise the advantages of competition, and we are prepared to pay the price of the duplication of work which is thereby entailed, for it has become recognised that competition results in economy and efficiency, which off-sets the duplication of labour; but there is neither necessity for nor advantage to be derived from over-elaboration in the preliminaries of reinforced concrete and steelwork, and we have indicated how some waste of labour can be eliminated.

"REINFORCED BRICKWORK."

A useful little pamphlet, written by Mr. Frederick Rings, M.S.A., architect, has been issued by the Fireproof Partition and Spandrel Wall Company, of Bank Chambers, Tooley Street, London Bridge. It would take us back very many years to find the first application of reinforced brickwork. Hoop-iron bond has been a principle of ordinary building construction familiar to everyone in the building trade and architectural profession for a century or more, and many years ago experiments were conducted to show the great strength which was obtained by placing hoop-iron between the joints of brickwork. These tests showed that a wall so reinforced could sustain very great loads as a beam. The principle of reinforced concrete construction was not, however, at that time, generally known, and the advantages of reinforcing brickwork obtained no reflected glory therefrom. We suppose it, therefore, seemed such an ordinary matter to the building trade that its importance was ignored, and the principle was in part forgotten. Certain works were carried out, it is true, but the time was not ready for its thorough development.

A good many years passed before the subject was taken up again, and then it remained for Germany to become the first to scientifically and thoroughly investigate the subject. Patents were obtained in Germany, England, and other countries for the system worked by the above-mentioned company, which was very extensively used in Germany for the construction of houses, barracks, garden walls, and almost every kind of construction. In this country the system has been much used also, as a glance at the illustrations included in this pamphlet will prove, though much of the work that has been carried out is not illustrated. In a previous issue we gave an illustration of a house at Letchworth that was constructed by this company upon their system, which consists in placing hoop-iron vertically and horizontally to form a square meshwork, the spaces of which measure 18 ins. by 18 ins., or two bricks high and two bricks wide. The hoop-iron is attached to brick piers, wooden uprights, stanchions, or any other form of vertical support, roof loads, floor loads, etc., being carried by such piers or stanchions, while the brick walls between are self-supporting. The brick wall between each horizontal course of hoop-iron is carried to the neighbouring piers, and thus the loads are concentrated upon these latter, so that it is only necessary to construct foundations at points, *i.e.*, under these piers or stanchions; in this way economy is obtained.

"Spandrel walls" have very great strength, as is shown by a test recorded in this pamphlet, in which a load of 13 tons was placed on a half-brick wall directly over a doorway opening. Thus floor and ceiling joists, etc., can be readily carried upon the wall if desired. The brickwork in this system is constructed with cement mortar, and the bricks are usually placed on edge, namely $2\frac{3}{4}$ins. thick, for dwelling premises, etc. Hollow walls are usually adopted, and the single wall is used more for partitions and boundary walls. The cement mortar protects the hoop-iron against corrosion. The hoop-iron framing has much the same effect as a lattice girder. The vertical reinforcements not only serve the purpose of rendering the wall virtually a lattice girder, but they also strengthen it when unsupported at the top, as in a boundary wall, where the pressure of wind or materials, etc., require it to act as a cantilever, for they would otherwise cause it to snap off and be pushed over. Additional strength can be given, if necessary, by constructing buttresses at points — the horizontal reinforcement then renders the wall between the piers a beam against both lateral and vertical loading, and its strengthening quality is brought more into play than in a wall of unbroken length. For the construction of boundary walls, as well as the construction of dwellings, frame buildings, etc., the reinforced brickwork on this system is very economical, by reason of the saving in the foundations, these latter only being required at points. To construct a strong brick wall on this system requires no special craftsmanship; for instance, many barracks have been erected in Germany by the soldiers themselves when free from drill. Once the hoop-iron is placed in position, the soldiers can easily fill in the bricks in the squares, and no skilled bricklayers are required. It will be seen that another economy is obtained in this direction, as no care is required in the laying of bricks, and no levelling up and plumbing are needed, this being automatically done by working between the hoop-iron guides, and the work is carried on with greater speed than ordinary brickwork construction. Thus the system affords great advantages in the way of economy, while it is theoretically a more efficient form of construction than ordinary brickwork. Unfortunately many of our by-laws stand in the way at present of the full application of such methods of construction, for walls are required to be increased in thickness proportionate to their height. However, the system has made great headway against such difficulties, and with the better education of the local authorities and the urban district surveyors, matters are improving. Such a construction has its obvious advantages in country districts for the erection of light structures; bricks can be obtained in the locality, hoop-iron can easily be obtained and brought on the job, and the structure erected with unskilled labour, under the supervision of a competent foreman. For the construction of temporary buildings, this system of reinforced brickwork is much superior to corrugated iron, for it is very cheap, and forms a permanent structure; but if a local authority will not permit it to be considered as such, a licence can generally be obtained for it as a temporary building, and no fear need be held that in the future its demolition will be ordered.

TWO FORMS OF TYPICAL INDENTED BAR BENDS WHICH CAN BE USED IN CONJUNCTION WITH STEEL JOISTS.

REINFORCED CONCRETE FLOORS.

The Patent Indented Steel Bar Company, Ltd., of Queen Anne's Chambers, Westminster, issue a very useful serial publication, entitled, "The Indented Bar Bulletin," which illustrates and describes the more important works in reinforced concrete construction executed on the "Indented Bar" system. Bulletin No. 4 deals with the subject of floor construction, and not only includes a number of diagrams and typical methods of constructing reinforced concrete floors, but gives several photographs of floors reinforced with "Indented Bars" in course of construction, and views of large buildings that have been recently constructed containing floors on this system. We reproduce therefrom a view of the construction of the basement floor of the new Selfridge Stores in Oxford Street, London, W., with two diagrams showing the manner in which the rods are cranked before placing in position over the steel beams. It will be obvious from these details with what ease the "Indented Bar" system can be carried out. This building occupies a site of 39,500 sq. feet, and is eight storeys in height, and when completed will form one of the largest stores in London. The contractors are the Waring and White (1906) Co., Ltd. The architect is Mr. Frank Atkinson, F.R.I.B.A. By the methods described the rods are easily handled and accurately placed in position, errors in workmanship being safeguarded against as much as possible by such means.

The "Indented Bar" is rolled from very high carbon steel, which has a high elastic limit, and, if the view is taken, as is argued, that, as a rule, in constructional work the elastic limit is the point upon which the factor of safety should be based, and not upon the ultimate strength, such high elastic limit steel has material advantages. In addition, the indentations in this particular bar give a thoroughly good mechanical bond to prevent the slipping of the bars, and if cracking takes place on the underside of a beam by reason of excessive loading, as required by theory and practice, this cracking is distributed over a number of small hair (almost invisible) cracks, extending regularly throughout the length, so safeguarding the rods from corrosion that might ensue from the development of large cracks produced by the concrete failing at irregular intervals. The details of the theory of structural design that the Indented Bar Company put forward are contained in their large catalogue, and should be studied, as the theories of the advocates for various systems should be carefully followed by students of the subject.

Among the recent contracts for which Indented bars have been used are schools at Ramsgate; Admiralty extensions, Devonport; Post Office, Glasgow; Military Store, Colchester; Telephone Exchange, Aberdeen, etc., etc.

THE KAHN CATALOGUE.

The catalogues published by the Trussed Concrete Steel Company, Ltd., of Caxton House, Westminster, have always been noteworthy because of their admirable get-up. A second edition of their large catalogue has just been issued, and is a great improvement upon the first edition. Though the catalogues have comprised much that is ordinarily contained in the trade catalogue, those of this company have been notable more for the fact that they emphasise a point in connection with reinforced concrete construction that a few years ago had been either ignored, or the importance of which had been very much underrated by other firms specialising in this form of construction. Mr. Julius Kahn, who is the inventor of the special type of reinforcement known as the Kahn Bar, the application of which constitutes the Kahn system of reinforced concrete construction, was the chief pioneer in the United States in respect of the importance of the adequate connection of shear members (or diagonal tension reinforcements) to the main longitudinal tensile reinforcements. Before he brought out the Kahn Bar, other firms had discovered the importance of shear members, but the members were, as a rule, loose, and not intimately connected with the main tension reinforcements; consequently, in beams subjected to a great amount of shear, they were not always efficient, because they slid along the bar. Apart from theoretical reasons, there are commercial advantages attached to the use of the Kahn Bar, as it is of practical convenience in construction, because of the fact that the shear members are part and parcel of the bar, and cannot easily become displaced, labour being saved thereby, and a greater efficiency of construction obtained. The catalogues of

SELFRIDGE STORES, OXFORD STREET, LONDON, W. CONSTRUCTION OF BASEMENT FLOOR ON THE INDENTED BAR SYSTEM.

this company, therefore, have made interesting and instructive reading, because of the arguments they put forward in favour of the rigidly attached shear members. The emphasis that has been laid upon the reinforcement of beams against shear (or diagonal tension, as it should be called) stresses, has directed the attention of designers to many aspects of the subject, which they would not otherwise have so clearly distinguished; in fact, this catalogue serves as a very good vehicle of instruction for anyone who is not very familiar with the subject of reinforced concrete, and desires to gain some idea of the general principles of the subject.

A considerable advance in knowledge has taken place in the last two years among the architectural and engineering professions with regard to reinforced concrete, and the catalogues of this company have kept pace with the movement. The present edition of the main catalogue is a great advance upon the first edition in regard to information upon the science of the subject. All the information as regards the standard sections of the Kahn Bars that is provided will be found of considerable service to designers, while there is a chapter on the theory of reinforced concrete design, with formulæ, that is interesting, and may be found of service by designers who are thoroughly familiar with the subject, and know how to use such data as catalogues supply with care and discrimination. For the ordinary architect and engineer, however, the subject is a little too tricky to be safely dealt with, and they will continue to place the matter of designing in the hands of specialists.

One very good feature of the catalogue is a specification for reinforced concrete work, and some notes on the subject of erection. Photographs, plans, and details of the construction of various buildings erected in this country upon the Kahn system included are most interesting, and give students a clear idea of the methods of practically executing reinforced concrete work.

The catalogues issued by the reinforced concrete industry generally afford, severally and generally, a most valuable collection of illustrations showing methods of executing various works, and overcoming difficult conditions, and this latest catalogue is no exception in this respect, for it provides an excellent commentary upon the most up-to-date methods of building and engineering construction under very many widely different conditions. All those specially interested in the subject should take care to add a copy of this catalogue to their library.

Trade and Craft.

The Edwardian chimney-pot, having met with high approval at Windsor Castle, is now being fixed at the King's residence at Sandringham. Several hundreds of these chimney-pots have also been used on the artizans' dwellings designed by Messrs. Joseph and Smithem for the Sutton Trust.

Messrs. Johnson and Phillips, Ltd., Charlton, S.O., Kent, and 14, Union Court, London, E.C., have just issued a new price-list of Paterson's bitumen damp-proof sheeting and damp-course, which, besides being serviceable in ordinary buildings, is also strongly recommended for bridge work, reservoirs, subways, underground conveniences, etc. The firm state that they carry a large stock of this material at their works at Charlton, S.O., Kent, and that they will be glad to send a copy of the price-list to anyone applying for it.

Messrs. E. H. Shorland and Brother, warming and ventilating engineers, Drake Street Works, Stretford, Manchester, have issued a new supplementary catalogue showing the latest designs of their warm-air ventilating patent Manchester grates, double-fronted patent Manchester stoves with open fires, patent exhaust roof ventilators, inlet ventilating panels, etc. A three-colour illustration represents the design of their double-fronted open fireplace patent Manchester stoves, as supplied to the Royal Victoria Infirmary, Newcastle-upon-Tyne, the British Hospital, Constantinople, etc. Various new patterns of their patent Manchester grates with low-fire projecting backs, and without front bars, as specially designed for hospitals and schools, are also shown. In addition, there are illustrations of new designs of patent exhaust roof ventilators, as well as of the Shorland's patent hygienic inlet ventilating panel, which has been recently introduced.

At the Franco-British Exhibition, the "Monocrete" system of building construction has been awarded a silver and a bronze medal by the International jury, the former in the special class of civil engineering, and the latter in the class for workmen's dwellings. In each case these were the only awards given to this class of building construction. It has been mentioned in a former issue that negotiations have been entered into with the French Government for the supply of "Monocrete" machines for army and colonisation purposes, and that orders have been received from the British Government for special "Colonial" outfits. It is now further announced that this system is being adopted on the Lagos Railway extensions in Western Africa. Arrangements have also been concluded for the supply for all the Monocrete machines to the Commonwealth of Australia for a period of five years, and there is a like arrangement for India, while extensive contracts have been entered into for most of the European countries, as well as at home. We are further informed that the Monocrete waterproofing compound, for use with all kinds of concrete work, is also meeting with a large measure of success. The Monocrete Construction Co., of Marle Hill, Cheltenham, will furnish full particulars.

Federation News.

The Conference of Secretaries.

The paper by Mr. A. G. White, National Federation Secretary, on "Federation Benefits," has been held over till next week, when a report of the recent Conference will be given.

* * *

BARROW MASTER BUILDERS' ASSOCIATION.—Mr. J. Baker, Secretary of this Association, has written to the local press, denying that Mr. R. T. Dockeray had, at a meeting of the Association, proposed that all employers in the Association should close their establishments for three months. Mr. Baker denies that such a thing was ever suggested either before or since his appointment as secretary. This disclaimer seems to have been provoked by some election oratory in the Salthouse Ward.

Bankruptcies.

BARNES, ARTHUR, CHAS. JNO., architect, late 9, Oakland Road, Clifton, and Guildhall Chambers, 26, Broad Street, Bristol, and The Firs, Winterbourne. First meeting, O.R.'s, Bristol, Nov. 4, at 11.45. P.E., Guildhall, Bristol, Nov. 13, at 12. Adj., Oct. 21.

BLANK, JOSEPH, builder, Nottingham Road, late Carr Street, Ilkeston. First meeting, O.R.'s, Derby, Oct. 31. P.E., C.C., Derby, Nov. 10, at 11.

CARTER, THOS. HY., and GEO. FRANK CARTER, painters and decorators, 89, High Street, Hartlepool, and 19, Bartlett Street, Darlington, respectively (trading as Carter Bros., at 89, High Street, Hartlepool). R.O., Oct. 20. Adj., same day.

CUMMING, ESAU HY. SMERDON, builder (described in R.O. as E. H. S. Cumming), 19, Merival Road, Harrow. Adj., Oct. 23.

DEER, CHAS. HARRY, builder, 81, Great Dover Street, Borough, S.E. R.O., Oct. 23. First meeting, Bankruptcy Court, Nov. 6, at 11. P.E., same place, Nov. 25, at 12. Adj., Oct. 23.

EARLAND, WM. HY., builder, 10, Heath Road, Harrow. First meeting, 14, Bedford Row, W.C., Nov. 2. P.E., C.C., St. Albans, Nov. 17, at 10.30. Adj., Oct. 17.

ESAIAS, ESAIAS, TYCADLE, PYLE, and EDWD. THOS. ESAIAS, builders and contractors, 72, High Street, Kenfig Hill (late trading as Esaias Bros., Tycadle, Pyle). R.O., Oct. 19. Adj., same day.

GEE, ALF., plumber, Victoria Buildings, Station Road, Carlton. R.O., Oct. 21. First meeting, O.Rs.', Nottingham, Nov. 4, at 11. P.E., C.C., same, Nov. 13, at 10.30. Adj., Oct. 21.

HERBERT, HY. WM., lodging at 41, Coronation Road, and JNO. BASS, 289, Swan Lane, builders (trading as Herbert and Bass at Ellen Street), all Coventry. Adj., Oct. 15.

HOBBS, WM., builder, 358, Streatham High Road, Railway Arches, South Side, Streatham Station, and 100, Gleneagle Road, Streatham. R.O., Oct. 22. First meeting, 132, York Road, S.E., Nov. 4, at 11.30. P.E., C.C., Wandsworth, Nov. 12, at 12.

MARSH, ALF., builder (described in R.O. as A. Marsh), late 162, Dalston Lane, and Portsdown Avenue, Golders Green. Adj., Oct. 19.

NEEDLER, ARTHUR, late builder, Sutton Ings, Holderness Road, Sutton, late Middleburg Street, Hull. First meeting, O.R.'s, Hull, Oct. 31. P.E., C.C., same, Nov. 16, at 2.

ROLFE, WM., builder, 189, Hazelbank Road, Catford. Adj., Oct. 20.

ROLLASON, GEO. FREDK., builder (trading as J. J. Rollason and Son), 176, Milcote Road, Bearwood, and Three Shires, Oak Road, Smethwick. R.O., Oct. 23. Adj., same day

SUTCLIFFE, EDWD., and JNO. SUTCLIFFE, builders and contractors (trading as Sutcliffe Bros.), Willow Terrace, Sowerby Bridge. R.O., Oct. 23. First meeting, C.C., Halifax, Nov. 6, at 10.45. P.E., same place, Nov. 27, at 2. Adj., Oct. 23.

THOMS, JAS., builder and contractor (trading as J. Thoms and Son, Brunton Road, Lancaster Adj., Oct. 21.

WHITFIELD, HARRY, bricklayer, late builder, 4, Granville Terrace, Wheatley Hill, near Thornley, late Wheatley Hill, and Haswell. R.O., Oct. 19. Adj., same day.

Coming Events.

Wednesday, November 4.

INSTITUTE OF SANITARY ENGINEERS.—Sessional Meeting. Mr. J. Lawrance on "Modern House Drainage," 8 p.m.

ROYAL SANITARY INSTITUTE.—Mr. J. E. Worth, on "Sewerage," 7 p.m.

NORTHERN POLYTECHNIC ARCHITECTURAL AND BUILDING STUDENTS' ASSOCIATION.—Dr. W. H. Mills, on "Crystallisation in Connection with Building Materials," 8 p.m.

GLASGOW INSTITUTE OF ARCHITECTS.—Mr. James R. Adamson, on "Culture for Architects."

Thursday, November 5.

THE CHEMICAL SOCIETY.—Ordinary Scientific Meeting, 8.30 p.m.

Tuesday, November 10.

INSTITUTION OF CIVIL ENGINEERS.—Mr. D. A. Matheson, M.Inst.C.E., on "Glasgow Central Station Extension," 8 p.m.

Monday, November 16.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. J. Alfred Gotch, F.R.I.B.A., F.S.A., on "The Elizabethan House as Illustrated by Contemporary Architectural Drawings," 8 p.m.

Monday, December 7.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. F. W. Troup, F.R.I.B.A., on "Ornamental Lead Work."

New Companies.

ARTHUR GRIFFITHS, LTD., capital £500, to acquire the business of a builder, contractor, joiner and cabinet maker, carried on at Warrington, by Arthur Griffiths. Registered September 23.

WALTER WALLIS, LTD., capital £12,000, to acquire the business of a builder and contractor, carried on by W. Wallis, at 209, High Road, Balham, S.W., and at Littlehampton, as Walter Wallis. Registered office, 209, High Road, Balham, S.W. Registered October 5.

BURMANTOFTS' TERRA = COTTA

Burmantofts' Terra-Cotta
is proof against the deleterious atmospheric conditions of many of our large towns which so frequently ruin stonework and other facing materials. Burmantofts' Terra-Cotta is strongly recommended for Façades of Public and other buildings.

The Fire-Resisting Powers
of Burmantofts' Terra-Cotta are greater than those of any other known building material. It has been conclusively proved that steel, iron, and other material properly encased in Terra-Cotta have withstood the greatest heats.

For Steel and Concrete Constructions
Burmantofts' Terra-Cotta is unequalled. It can be jointed and prepared to suit its position, thus saving considerable time, trouble, and expense.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Nov. 5. BARCALDINE, LEDAIG.—Repairs to the United Free Church manse, Barcaldine, Ledaig. Plans and specification to be seen at the offices of G. Woulfe Brenan, C.E., Oban, who will receive tenders up to Nov. 5.

Nov. 5. DELABOLE (Cornwall).—Erection of a villa residence at Delabole, Cornwall. Persons desirous of tendering may see the drawings and specification on application at 21, Sea View Terrace, Plymouth, where tenders are to be delivered before Nov. 5.

Nov. 5. GRANGE-OVER-SANDS.—Erection of workrooms in Kents Bank Road, Grange-over-Sands, for R. and H. Law. Plans may be seen and quantities obtained from Settle and Brundrit, A.R.I.B.A., Olverston and Barrow, architects. Sealed tenders, endorsed "Workrooms, Grange," to be delivered to the offices of the architects by noon on Nov. 5.

Nov. 5. DERBY.—Erection of a carriage and wagon-lifting shop at Derby, for the Midland Railway Company. Plans and specifications may be seen, quantities and particulars obtained on application at the engineer's office, Derby Station. Sealed tenders to be forwarded by post to the secretary of the way and works committee, Midland Railway, Derby, by 9 a.m. on Nov. 5.

Nov. 6. SOLOHEAD (Ireland).—Erection of a brick chimney at the creamery at Solohead, convenient to Limerick Junction station, co. Tipperary, for the committee of Solohead Co-operative Agricultural and Dairy Society, Ltd., according to plan and specification prepared by T. F. Ryan, C.E., Hotel, Limerick Junction. Plan and specification are deposited at the office of the society, and may be seen up to Nov. 5. Sealed tenders to be sent by Nov. 6, to W. Flynn, secretary.

Nov. 7. LOUGHBOROUGH.—Erection of a new technical institute at Loughborough, for the Leicestershire C.C. education committee. Conditions of contract, etc., may be obtained from the architects, Barrowcliff and Alcock, town hall chambers, Loughborough, on payment of £2 2s.

Nov. 7. BANGOR.—Erection of new hostels at the Normal College. Persons desirous of tendering are invited to apply for bills of quantities to Evan R. Davies, secretary, Normal College, Bangor, enclosing a cheque of £5 5s. Applications to be made by Nov. 7.

Nov. 7. THORNBURY.—Erection of class and cloakrooms, for the governors of the Thornbury grammar school. Plans and specifications may be seen at the office of Francis J. Williams, Chapel Street, Thornbury, R.S.O., between 10 and 5 daily, Saturday 10 and 1. Sealed tenders to be delivered to the clerks to the governors, Crossman and Co., solicitors, Thornbury, by 9 a.m. on Nov. 7.

Nov. 7. KEA (Cornwall).—Erection of a pair of cottages at Trevean, in the parish of Kea, for the Right Honourable Viscount Falmouth. Persons desirous of tendering can inspect plans, conditions and specifications, at the Farm House at Old Churchtown, Kea, in the occupation of W. L. and J. P. Hearle. Tenders should be sent by Nov. 7 to George Gow, Tregothnan office, Truro.

Nov. 7. GLASGOW.—Removal and renewal of parapet walls, pavement and railings surrounding St. George's Church, 163¾, Buchanan Street, for the Corporation. Drawings may be seen and forms of tender obtained on application to the city engineer at his office, 64, Cochrane Street. Sealed offers marked outside "Offer for Parapet Walls, etc., St. George's Church," must be lodged by Nov. 7, with A. W. Myles, town clerk, City Chambers, Glasgow.

Nov. 7. SOWERBY BRIDGE (Yorks.).—Extensive alterations of shops at West Vale for the Sowerby Bridge Industrial Society, Ltd. Plans and specifications may be seen, and bills of quantities obtained at the offices of Medley, Hall, and Son, architects and surveyors, 1, Harrison Road, Halifax, from Oct. 31 to Nov. 7, on which last-named day sealed tenders, endorsed "Tender for Alterations to Shops," to be delivered at the offices of the Society or to the architects. Fair wages clause.

Nov. 7. NEWTON HEATH (Manchester).—Strengthening, etc., Church Street Bridge, over the Rochdale Canal, Newton Heath, for the Corporation. Drawing may be seen, and specification, bill of quantities and form of tender obtained, on application at the city surveyor's office, town hall, Manchester, on payment to the city treasurer of two guineas. All cheques or postal orders to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in official envelope, addressed to the chairman of the Improvement, etc., committee, must be delivered at the city surveyor's office by 10 a.m. on Nov. 7.

Nov. 9. ELGIN.—Mason, carpenter, plumber, and painter work in rebuilding Elgin Coach Works. Plans, specifications, and conditions of contract to be seen with R. B. Pratt, architect, County Bank House, Elgin, who will receive offers up to Nov. 9.

Nov. 9. LLANGADOCK (Wales).—Execution of structural alterations, painting, and papering, etc., and erection of a gardener's cottage, at Abermarlais Park, Llangadock. Specifications and plans can be seen at the office of D. T. M. Jones, solicitor, Llandovery, during office hours. Tenders to be sent by Nov. 9.

Nov. 9. MERTHYR TYDFIL.—Erection of 38 houses at Danyderi, Merthyr Vale, and 68 houses at Penywern, Dowlais, for the corporation. Separate tenders, endorsed "Danyderi Houses," and "Penywern Houses," respectively, must be delivered to T. Aneuryn Rees, town clerk, town hall, Merthyr Tydfil, by noon on Nov. 9. Plans and specifications can be seen at the office of the borough surveyor, town hall, Merthyr Tydfil.

Nov. 9. CHESTER.—Construction of additional and the alteration of existing municipal offices, town hall, Chester, for the Corporation. Plans and specifications can be seen at the office of W. T. Lockwood, F.R.I.B.A., 88, Foregate Street, Chester, and quantities obtained on deposit of £1. Tenders are to be sent by Nov. 9, enclosed in sealed envelopes, addressed "The Town Clerk, Town Hall, Chester," endorsed on the outside "Office Accommodation," to J. H. Dickson, town clerk, town hall, Chester.

Nov. 9. INISHOWEN (Ireland).—Erection of 7 single labourers' cottages and 36 cottages in blocks of two, and fencing the 43 plots, for the Inishowen R.D.C. A contractor may tender to erect all cottages and fence all plots, or for such proportion as can be satisfactorily completed in the specified time. The works are to be completed within 6 months after they have been laid out by one of the council's engineers under a penalty for delay. Plans, specifications, and tender forms can be obtained from the clerk to the R.D.C., on payment of 5s., and tenders are to be lodged in his office by noon on Nov. 9. Tenders must contain the names and addresses of two solvent persons willing to join in a bond of an amount of £250 for each cottage, including fencing. Full particulars can be had from Robert Moore, clerk.

Nov. 11. BALROTHERY (Ireland).—Erection of 45 labourers' cottages throughout the union, for the R.D.C. A provision has been introduced into the specification permitting the use of hollow concrete blocks, instead of stone. Lists containing descriptive particulars of each cottage, also forms of tender, can be had on application to James Stack, clerk of the council, boardroom, workhouse, Lusk, Co. Dublin. Plans and specifications may be inspected at the workhouse, or at the office of the architect, Anthony Scott, C.E., 49, Upper Sackville Street, Dublin. Tenders will be considered at the council's meeting on Nov. 11.

Nov. 11. KINSALE (Ireland).—Erection of 42 single cottages, for the R.D.C. A contractor may tender to erect all the cottages, or for such number as may be completed satisfactorily in the specified time. The works are to be completed within six months after they have been laid out by the council's engineer, under a penalty for delay of £5 per week for each cottage. A deposit of £2 per cottage must be lodged with each tender. Conditions of contract and any other particulars with tender forms, can be had on application to John Murphy, clerk of council, council office, Kinsale, with whom tenders should be lodged by 11 a.m. on Nov. 11.

Nov. 12. GUISELEY.—Execution of various works in the parish church extension, in accordance with plans prepared by Nicholson and Corlette, of 2, New Square, Lincoln's Inn, W.C. Applications for quantities must be made by Nov. 12, to Harold Chippindale, architect and surveyor, Guiseley, near Leeds, when quantities will be forwarded in due course. Applications must be accompanied by a deposit of one guinea.

Nov. 12. BRIDGEND.—Alterations to Llangan Rectory, near Bridgend, for the Reverend Owen Jones, Rector. Plans can be seen, and bills of quantities obtained, at the office of the architect. Tenders are to be delivered by Nov. 12, to G. E. Halliday, F.R.I.B.A., 19, Castle Street, Cardiff.

Nov. 12. DUBLIN.—Alterations and additions to recreation hall, etc., at the Royal Hibernian Military School, Phœnix Park, for the board of public works. Tenders will be received up to 10 a.m. on Nov. 12, by H. Williams, secretary, office of public works, Dublin, where plans and specification can also be seen. Forms of tender and bills of quantities will be supplied on deposit of £1. Separate envelopes containing tender and the bill of quantities must be endorsed "Tender for Works at the Royal Hibernian Military School."

Nov. 14. PONTYPRIDD.—Erection of a residence, with outbuildings, etc., in the Lan Wood, Pontypridd, for S. G. Hill. Plans and specifications can be seen and bills of quantities obtained at Pontypridd and Tonypandy offices, and at 12, Edward Terrace, Cardiff, on deposit of £1 1s. Tenders to be sent by Nov. 14 endorsed "Tender for Lan Wood House," to W. Morgan Lewis and T. Naunton Morgan, architects and surveyors, Pontypridd.

Nov. 14. BRACEBRIDGE (near Lincoln). — Additions to the Bracebridge Girls' School, near Lincoln, for Kesteven C.C. Bills of quantities and forms of tender may be obtained at the office of the county surveyor, 53, High Street, Grantham, upon deposit of £1. Specifications and plans may be seen at the office of H. H. Dunn, Silver Street, Lincoln, or at the county surveyor's office, Grantham. Sealed tenders, endorsed "Tender for Bracebridge School," to be delivered by Nov. 14, to Hudson Donaldson, secretary, county education office, 64, London Road, Grantham.

Nov. 16. WHITELEY WOODS, SHEFFIELD.—Erection of new lodge and conveniences at Whiteley Woods, for the City Council. Plans may be seen, bills of quantities and forms of tender obtained, on application to the city architect, town hall, Sheffield. Sealed and endorsed tenders (enclosed in envelope provided) to be delivered by Nov. 16, to R. M. Prescott, town clerk, town hall, Sheffield. Fair wages clause.

Nov. 19. BROMLEY-BY-BOW.—Erection of a bathroom at the workhouse, St. Leonard's Street, Bromley-by-Bow, E., for the guardians of Stepney Union. Specifications and forms of tender, etc., can be obtained on application to the clerk, and tenders must be delivered by 4 p.m. on Nov. 19, to T. G. Stacey, clerk, guardians' offices, Barnes Street, Stepney, London, E. Plans can be inspected any day (except Thursday) between 10 a.m. and 5 p.m.

Nov. 20. BELFAST.—Erection and completion of new male schools, Seaforde Street, Belfast. Plans and specification can be inspected at the offices of J. J. M'Donnell, architect, 27, Chichester Street, and bills of quantities obtained from Acheson Ferguson, Scottish Provident Buildings, on deposit of one guinea. Sealed tenders, endorsed "Seaforde Street Schools," are to be delivered to Very Rev. H. Laverty, P.P., D.D., St. Matthew's Presbytery, by 5 p.m. on Nov. 20.

No date. WREXHAM.—Erection of a church house in Regent Street, Wrexham. Quantities, conditions of contract and date of receiving tenders may be obtained from Prothero, Phillott, and Barnard, architects, 13, Promenade, Cheltenham, on deposit of 10s.

No date. NANTWICH. — Erection of new schools in Hospital Street, Nantwich, for the Wesleyan Methodist school trustees. Bills of quantities and form of tender may be obtained from R. Matthews, architect, Parr's Bank Chambers, Nantwich, on payment of £1 1s.

No date. BATLEY.—Erection of two houses off Norfolk Street, Batley. Persons desirous of tendering for the various works are requested to send their names and addresses to John H. Brearley, architect, Commercial Street, Batley, when bills of quantities will be forwarded.

No date. OXFORD.—Complete fitting up of show yard for one or three years, for the Oxfordshire Agricultural Society. Specification, together with schedule and form of tender, can be obtained on application to H. Sammons, secretary, 68, St. Giles, Oxford. Applicants should state what experience they have had in this class of work.

ENGINEERING.

Nov. 6. LISMORE.—Repairing the well shaft on the workhouse premises, for the Board of Guardians. Tenders should be submitted by Nov. 6 to Alex. Heskin, clerk of union.

Nov. 6. PENYGRAIG AND BLAENCLYDACH.—Laying about 1,300 yds. of 6 and 3 in. gas mains at Penygraig and Blaenclydach, for the Rhondda U.D.C. Plans and specification may be seen and form of tender supplied upon application to Octavius Thomas, engineer and manager, gas and water offices, Pentre, Rhondda, upon depositing one guinea. Tenders to be addressed to the chairman of the gas and water committee, endorsed "Tender for Laying Gas Mains, Contract No. 46," and delivered by 10 a.m. on Nov. 6, to Walter P. Nicholas, clerk to the council, public offices, Pentre, Rhondda. Fair wages clause.

Nov. 9. BRISTOL.—Installation of heating apparatus in the place of worship now being erected at the Stapleton workhouse, in accordance with a statement which is deposited for inspection at the office of the clerk. Tenders, on the prescribed form, which can be obtained of the clerk, must be delivered by noon on Nov. 9, to J. J. Simpson, clerk to the guardians, St. Peter's Hospital, Bristol.

Nov. 9. EMSWORTH AND SWAYTHLING.—Installation of low pressure hot water apparatus at the new council schools, Emsworth and Swaythling, for the Southampton C.C. Persons desirous of tendering may see plans and specifications, and obtain all other information at the office of W. J. Taylor, county surveyor, The Castle, Winchester, between 9 a.m. and 5 p.m. (Saturdays, 9 a.m. and 1 p.m.). Separate tenders, endorsed "Heating Apparatus, Hemsworth Council School," and Heating Apparatus, Swaythling Council School," respectively, are to be delivered by 10 a.m. on Nov. 9, to H. Barber, clerk of the county council, The Castle, Winchester.

Nov. 11. KINSALE (Ireland). — Execution of sundry works, including the construction of tanks and reservoir, supplying and laying pipes, etc., in connection with a scheme of waterworks for the village of Ballinspittle, for the R.D.C., in accordance with plans and specifications which may be seen at the council office, Kinsale workhouse, and at the office of R. Evans, C.E., 53, South Mall, Cork. The person whose tender is accepted must enter into a bond, with two approved sureties, for double the sum mentioned in the tender, to be prepared at the contractor's expense by the council's solicitor. With each tender a deposit of £5 shall be lodged with the clerk. Sealed tenders, giving the name, address, and occupation of each of the sureties, are to be lodged by 11 a.m. on Nov. 11, with John Murphy, clerk of council, council office, Kinsale Workhouse. The works are to be completed within five months from the acceptance of tender.

Nov. 12. ELLOUGHTON AND BROUGH (York).—Construction of spring collecting works, collecting chambers, covered storage reservoir, 6,420 yds. of 5 in., 4 in., 3 in. and 2 in. cast-iron water mains, with valves, washouts, fire hydrants, consumers' services, and other works in connection therewith, at Elloughton and Brough, in the county of York, for the Elloughton and Brough Water Co., Ltd. Drawings, specification, etc., may be seen with Fairbank and Son, M.Inst.C.E., engineers to the company, Lendal Chambers, York, from 10 a.m. to 5 p.m., except Saturdays. Copies of specification, quantities and form of tender may be obtained on deposit of £3 3s. Sealed tenders, endorsed "Tenders for Elloughton and Brough Waterworks, Contract A," to be sent to E. Hind, solicitor, Goole, before 10 a.m. on Nov. 12.

Nov. 13. LLYN FAWR (Glam.).—Construction of a reservoir at Llyn Fawr Lake, in the parish of Ystradyfodwg, Glamorgan, with works in connection therewith, including a temporary tramroad connecting the works with the Great Western Railway at Hirwain, for the Rhondda U.D.C. Drawings may be inspected and copies of the specification, schedule of prices and forms of tender obtained upon application to J. E. Hughes, M.Inst. C.E., at his office at Tynewydd, Treherbert, upon a deposit of £5. An assistant engineer will accompany attending contractors to the site of the works on Oct. 27, starting from the engineer's office at Tynewydd, Treherbert, at 11 a.m. Sealed tenders, enclosed in envelopes provided, and addressed to the chairman of the council, endorsed "Tender for Reservoir," must be delivered by 10 a.m. on Nov. 13, to W. P. Nicholas, clerk, council offices, Pentre, Glam. Fair wages clause.

Appointments Wanted.

The charge for Advertisements under this heading 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ARCHITECTS.—GOOD CLASSIC DETAILS. Architect's Assistant with 10 years' thorough experience in good offices on important classic and renaissance work, disengaged. Give part evenings to competition work; age 28; salary £2 5s.—Apply to W. H. Garwood, 32, Marine Parade, South Lowestoft. 4638

ADVERTISER, disengaged, holds Royal Sanitary Institute diploma, London and Provincial experience; six months as Clerk of Works, expert surveyor and leveller; plans, specifications; superintendence; quantities, etc.—Box 4649, Builders' Journal Office.

ARCHITECT'S Assistant seeks engagement; has had nine years' experience in good offices (London and the provinces); just completing engagement with City firm; excellent testimonials; moderate salary.—Box 4636, Builders' Journal Office.

ARCHITECT'S junior assistant (21), 5 years' church and domestic experience in busy provincial office; surveying and levelling; excellent references; modcrate salary.— Box 4645, Builders' Journal Office.

ASSISTANT (20), builder's or surveyor's, 4 years with quantity surveyor, office routine, abstracting, billing, construction, land surveying, levelling, plans, tracings.—Henry Priddle, 4, Sumatra Road, West Hampstead. 4653

ARCHITECT and surveyor's junior assistant desires situation; 4 years' experience; good draughtsman, plot from sketches; certificates, building construction; also shorthand (100) and typewriting; good testimonials; energetic; would go on trial; age 19; salary £1. — Box 4674, Builders' Journal Office.

A COMPETENT Architectural Assistant (22) seeks appointment; excellent testimonials and hon. certificates. Open to take place with surveyor, estate agent, sanitary engineer, etc. Salary, 30s.—Apply Box No. 4688, Builders' Journal Office.

ARCHITECT'S junior assistant, ten years' varied London experience, references, 35s., or by arrangement; churches, domestic alterations, measuring; London, Provinces.—Dicken, 8, Westbury Road, Ealing. 4650

ARCHITECTURAL Improver, or junior assistant (21), excellent knowledge in good design, very neat and clever draughtsman; assist quantities, surveying, perspectives; moderate salary; specimens.—Box 4635, Builders' Journal Office.

ASSISTANT, A.R.I.B.A. (29), thirteen years' London experience, working drawings, perspectives, specifications, supervision; office work; well up in management; salary 2 guineas; London preferred.—Apply Box 4622, Builders' Journal Office.

ARCHITECT'S assistant (23), over 7 years' London and Provincial experience; excellent references; Inter.R.I.B.A. Exam. — H. J. Wilson, "Brinkdale," Park Road, Peterborough. 4670

ARCHITECT and Surveyor's Assistant (24); 8 years' London exp.; working drawings, specifications, superintendence, prizeman and medallist, testimonials; mod. sal.—W., 20, Holmewood Road, Streatham Hill, S.W. 4669

ARCHITECT and surveyor's junr. assistant; 5½ years' experience; working and detail drawings; levelling, perspectives, specifications; assist quantities; excellent testimonials; moderate salary.—Box 4546, Builders' Journal Office.

ARCHITECT and Surveyor's junior assistant desires engagement; probationer R.I.B.A.; good draughtsman; 4½ yrs.' general exp; moderate salary.—F. G. C., 46, Franklin Road, Gillingham, Kent. 4641

ARCHITECT and surveyor's assistant, 10 years' good all-round experience, north and south; take charge; capable draughtsman; working drawings, details, quantities; moderate salary.—W. T., 49, Whitstable Road, Canterbury. 4561

ARCHITECT'S and Surveyor's Assistant desires change; 6 years' varied general experience; assist quantities, good refs.—Box 4617, Builders' Journal Office.

ARCHITECT'S and Surveyor's Assistant (27), desires re-engagement, 11 years' good varied experience, working drawings, details, surveying, levelling; excellent draughtsman, highest references; specimens.—A. H. Laister, 51, Warwick Street, Rotherham. 4654

ARCHITECT'S Junior Assistant, over 4 years' London experience, competition work, contract drawings, details, perspective; honours construction, Prelim. R.I.B.A.; very moderate salary.—Box 4661, Builders' Journal Office.

ARCHITECT'S son, 10 years' office experience, wishes to take up agency or post as representative in Lancashire, or North of England, to well-known firm in any special line of Building trade. —Apply Box 4585, Builders' Journal Office.

AS Clerk, cashier, depot manager, or any position of trust, 11 years' experience, builder's and coal merchant's trade; age 25; good penman; also reference; moderate salary.—Box 4659, Builders' Journal Office.

BUILDER'S or Architect's Assistant (24), seeks re-engagement; drawing, typewriting, shorthand, correspondence, accounts, and general office routine; also assist in quantities; 9 years' references; moderate salary.—Apply Box 4626, Builders' Journal Office.

BUILDER'S Clerk and assistant (20), seeks engagement, general experience, book-keeping, time sheets, plans, etc.; good references, and moderate wages.—Apply Box 4555, Builders' Journal Office.

BUILDER'S and Surveyor's Assistant (24), practical experience in construction and surveying; also quantities and levelling, supervision; assist estimating; draughtsman; well up in costs, accounts, wages, etc.; moderate salary.—Box 4684, Builders' Journal Office.

BUILDER'S and decorator's clerk seeks situation, well up in all trades; ten yeafs' experience; age 26; Midlands preferred; wages moderate.—Apply Box 4599, Builders' Journal Office.

BUILDER'S (25) confidential assistant desires engagement; 5 yrs.' training, workshop and building works; 8 yrs.' office management; shorthand-typist, correspondence, book-keeping, estimating, supervision; highest refs.—Box 4639, Builders' Journal Office.

CLERK of Works, 16 years' experience, supervision and management of important buildings in London and country, well up in details, special knowledge of ecclesiastical buildings. — T. B., Box 4603, Builders' Journal Office.

CARPENTER and Joiner (age 32) wants job. Bench, fixing, alterations, or jobbing. Could take charge if required. Good references. Life abstainer.—Pearson, 53, Hartham Road, Isleworth, W. 4681

CARPENTER'S work, carcassing, stairs, shopfitting, etc., wanted. Piecework, labour only; houses, etc., taken right out. Any quantity, and distance no object.—G. Bown, 3, Albert Villas, Old Church Hill, Chingford. 4658

CARPENTER and joiner wants job; all-round hand, used to jobbing shop. Eight years' references last job. Wages moderate.—Cooke, 10, Cumberland Road, Walthamstow. 4652

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, Builders' Journal Office.

FOREMAN Painter (working); life experience; good colourman; do any class of work; manage any number of men; life abstainer; non-smoker; good references.—T., 39, Northbrook Road, Croydon, Surrey. 4625

GENERAL Foreman, 30 years' experience; man of ability; good references.—Foreman, 200, Francis Road, Leyton, N.E. 4685

GENERAL foreman, shortly disengaged, just completing large schools in North Stafford; abstainer; age 34; 12 years management of men.—Burchall, Crow Lane, Earlestown, Lancs. 4666

GENERAL foreman, disengaged, thoroughly practical and reliable; 20 years' experience; new or alterations; first-class reference.—F. C., 3, Crewdson Road, Brixton, S.W. 4668

GENERAL Foreman shortly disengaged, just finishing large job; town or country; thirty years' experience; thoroughly practical in all branches; good manager; steady and reliable; first-class testimonials.—W. R., New Council Schools, Biddulph Moor, Congleton. 4621

HIGH-CLASS decorator, manager, seeks re-engagement; estimator for all classes of best work; abroad if necessary; excellent testimonials; moderate salary.—Apply Forbes, 7, Eldon Street, York. 4677

IMPROVER, brass-finisher, requires situation; 3 years' previous experience with well-known London firm; excellent references. Apply Box 4550 Builders' Journal Office.

JUNIOR Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, Builders' Journal Office.

LATE Pupil (22), four years' experience, requires berth as surveyor's or architect's assistant, drawing, surveying, levelling, qualified Stage III., Building Construction and Architecture.—J. W. D., Laurelwood, Hare Lane, Godalming. 4582

MANAGER of masonry works or general foreman, well up in management of men and machinery, London and country experience; practical in all trades. — Thomas, 38, Napier Road, Tottenham. 4602

PLUMBER (26), abstainer, well up in all sanitary or lead-laying; will do piecework; town or country. Can do zinc and hot water.—W. E. B., School House, Muriel Street, Barnsbury, N. 4615

PLUMBER (Reg. by Exam.), well up in hot water and heating systems, capable of taking entire charge; 6 years' ref.; age 38.—H. P., 11, New Buildings, Hampstead, London. 4676

QUANTITY Surveyor, London, first-class experience, and qualifications, wishes to arrange with architects or others for preparation of bills of quantities, adjustment of variations, etc.—Box 4675, Builders' Journal Office.

QUANTITY Surveyors.—A builder wishes to place his son (18) in above office; has had some experience. No premium, but can introduce business.—Apply H., Ashford House, Wimbledon Common. 4686

QUANTITY Surveyor, Member Q.S.A., 32, eight years' practical building experience, eight years' office practice, desires post as senior or managing assistant.—Box 4610, Builders' Journal Office.

SLATE MERCHANTS AND BUILDERS' MERchants.—Experienced traveller (with 14 years' connection Midlands), desires re-engagement; at liberty middle of December; or could arrange earlier.—Address, Slate, c/o Secretary, Builders' Exchange, Sheffield. 4624

SLATING and tiling wanted (labour only) day or piece; any quantity, large or small; distance no object.—Mack, Slater and Tiler, 3, Granville Cottages Tower Hamlets Street, Dover. 4619

SHOP or General Foreman, long West-end experience, used to alterations and repairs; understands stairs; used to good jobbing work. Address A., c/o Mr. Seymour, 14, Allsop Place, Regent's Park, N.W. 4586

STUDENT R.I.B.A., 23, well trained man, desires situation as assistant; 1½ guineas. — Box 4607, Builders' Journal Office.

STONEWORK wanted (piecework).—Stone dressings, Bath stone fronts to villas, etc.—Apply A. Powell, mason, 15, Elm Lodge Avenue, Reading. 4667

TO Builders.—Situation as improver wanted by young man just out of his time; technical student; neat draughtsman; assist with quantities, supervision, etc.; abstainer. — Box 4662, Builders' Journal Office.

TO Estate Owners.—Builder (38), varied experience, desires position as agent or clerk of works, surveys, plans, quantities, setting out, accounts and supervision; country preferred.—Box 4591, Builders' Journal Office.

Appointments Vacant.

APPLICATIONS for architectural situations written promptly in striking form, that will exhibit applicants' capabilities and experience to best advantage, by technical man. — Box 4616, Builders' Journal Office.

CAPABLE clerk required in London office, must have experience of estate work and repairs to house property; book-keeping and rent collecting.—Apply by letter only, stating age and qualifications, to A. J. H., 36, Princess Road, Regent's Park, N.W. 4665

FOREMAN Painter.—Wanted by London contractor a thoroughly competent and energetic man, to take entire charge of painters; must be accustomed to dealing with a large number of men on scattered jobs.—Apply, giving at least two references, and full particulars to A. Z., Box 4629, Builders' Journal Office.

MARBLE.—Smart salesman required, with thorough knowledge of the wholesale marble trade; good opening and permanent post for right man.—Apply Salesman, Box 4671, Builders Journal Office.

November 11, 1908. Volume 28, No. 718.

The Board of Arbitration.

The formation of the new Permanent Board of Arbitration, and the publication of three lists, or panels, of gentlemen, selected by the Board of Trade as members of the new board, has led to some disquiet among building trade employers, as, for the moment, they are not represented. It will, however, be within the recollection of readers that the publication of these lists was accompanied by the statement that they were incomplete, and this is, presumably, still the case. The three panels are the chairman's panel, consisting of judicial and well-known public men; the employers' panel, comprising representatives of employers in all branches of trade; and the employers' panel, formed of representatives of workmen in the various trades. The object of the Board of Trade is to select from the panel of employers one or two gentlemen connected with the particular trade in which a dispute has arisen; to select from the employees' panel an equal number of representatives of workmen in the particular trade involved; and from the remaining panel a chairman of integrity and unbiassed opinion. The number of members in a Court of Arbitration is not to exceed five, and, if possible, is to be limited to three—a chairman, one employer, and one workmen's representative; and the choice of the members is reserved to the Board of Trade. These arrangements seem, on first reading, to be exceedingly sound, and likely to afford, as is desired, courts well acquainted with the questions in dispute. We are not sure, however, that the limitation to three or five members will work satisfactorily. If the dispute is widespread, or particularly acute, the two trade representatives, in a court of three, are liable to become ex parte advocates, leaving the chairman in the unfortunate position of either having to split the difference between them or give a casting vote. "Splitting the difference" is at present one of the curses of arbitration, and, though an easy way out of a deadlock, is a rank injustice, and productive of future evil, since it encourages aggresive and exaggerated demands. Five members give a greater margin of safety, but we think seven or nine would have been even better. In a court of three, the employer, or employees' representative, who agrees to a verdict against his fellows, will be in an unenviable position when he rejoins them. To have three or four representatives of each trade in the employers' and the employees' panels would possibly make them unwieldy, and this may be the reason for limiting the courts to a maximum of five members. The important point for building trade employers just now is to see that they are properly represented on the employers' panel. We have applied to and are now awaiting information on this point from the Board of Trade. But it would be advisable for the building trade employers to have ready the names of their nominees.

Physico-chemical Aesthetics.

In an interesting paper read by Mr. Felix Clay before the Architectural Association on November 6th, a courageous attempt was made to trace to its source the sense of taste in art. In such an investigation, the reference to evolutionary principles was inevitable, the lecturer being, for the occasion, not at all concerned with the superstructure, but keenly interested in the foundations and the earthwork. He tried to ascertain what is at the bottom of our likes and dislikes in colour, form, and proportion, and finds that these sensations "are the present forms of originally necessary reactions formed by physico-chemical reflexes, which drew the organism [a primitive organism of a rudimentary type] towards the wholesome or suitable, or away from the dangerous or unsuitable." As the organism developed, experience was accumulated, faculty was expanded, and aesthetic feeling was intensified and refined, until now it is a thing compounded partly of inherited predisposition surviving from one's "primordial protoplasmic atomic ancestors," as Pooh-Bah would say, partly of what is drawn from one's own experiences and environment. Taste in art, therefore, is, as to its origin, a matter of sub-conscious natural selection and survival; but, within certain limits, the possessor may not only train and control the aesthetic sense—use and improve such faculty as he has inherited—but may further acquire "what seems to be an absolutely unconscious feeling for things which have previously been conceived and recognised." Taste becomes instinctive. Whether or not an architect is likely to become a better artist from pondering these things is a question that need not be here discussed; but, at any rate, Mr. Clay's essay in physico-chemical aesthetics makes an irresistible appeal to the speculative mind; and minds that do not answer in some degree to that description are but of barren promise in budding architects. We have in type an abstract of Mr. Clay's paper, which we are obliged to hold over from want of space. We are the more sorry for the unavoidable delay, since we are given to understand that Mr. Clay's thesis has evoked, from at least one architect, a rather strong protest, which should delight the author of the paper, who, we feel sure, will be quick to recognise that in such a case antagonism is better than apathy.

Glasgow and Federation.

Glancing through the Building Trades Federation reports that appear monthly in this journal, and of which the third batch is contained in the present issue, we have been particularly struck by two features—the thoroughness with which master builders throughout the kingdom have been organised, and the unaccountable aloofness of Glasgow. We understand that the Glasgow employers are organised; but what seems strange is their apparent reluctance to join hands with the Scottish Federation. We must confess to some curiosity as to the reasons for this disaffection. Glasgow is acknowledged to be the chief centre of the building trade in Scotland, and it is therefore perfectly clear that so long as Glasgow stands out, the Federation in that country must remain lamentably incomplete. We believe that every effort has been made—particularly by Mr. Cameron, the able and energetic secretary of the Scottish Federation—to induce Glasgow to join, but hitherto without success, and we trust that ere long Glasgow will recognise the impolicy of isolation. If the interests of the building trade in Scotland are to be properly safeguarded, Federation must be made complete by the linking up of Glasgow with Edinburgh, Aberdeen, and Dundee. By maintaining an ill-advised independence, Glasgow is playing into the hands of the enemy. Glasgow men have the highest possible reputation for astuteness, and it is therefore superfluous to point out to them the perfectly obvious advantages of unbroken federation and complete unity of organisation. Their accession would, we are convinced, be of all-round benefit to the interests of building trades employers throughout Scotland. We are informed that a new scheme of federation for Scotland is now under consideration, and we should be very glad to find Glasgow taking an active part in it.

Very Civil Engineering.

A strong reform committee of the Institution of Civil Engineers is pressing for a practical application of several propositions that

were put forward in the presidential address by Mr. J. C. Inglis. That gentleman pointed out, in effect, that the activities of members might with advantage be extended beyond mere support of the Institution as a scientific organisation. Interpreting his guarded phrases into plain English, it may be said that the aim is to give the Institute more of the character of a protective union. There is to be more "discipline," and more "control of the practice of civil engineering." What form the "discipline" is to take is not yet clear; it is probably a matter for future deliberation; but there is not much room for doubt as to the intention of the next paragraph cited from the above-mentioned address: "I do not contend that membership of this Institution is the only criterion of engineering competence; but if the India Office and other great departments of the State are alive to the desirability of public money applied by these well-organised departments to engineering purposes being administered by definitely qualified engineers, I hope it will not be considered as going too far to suggest that in this year 1908 it ought to be laid down as a principle that all public money derived from rates and taxes should be, so far as it is applied in engineering construction, expended under the direction or control of definitely qualified engineers, as is already the case in many countries." The Institution, having taken care to secure the proper training of its new members, is now realising that professional status has its rights as well as its duties, and, having enforced the duties, it seems justly disposed to assert the rights. The reform committee, we gather, propose to add to the Institution's test for technical and scientific knowledge a standard of practical attainments; and they also, still following Mr. Inglis, advocate "provision for original search on engineering subjects," and for the elucidation or settlement of engineering principles. The title, "reform committee," often connotes wildly extravagant and subversive ideas; but in this instance, the reform will command the sympathetic interest of cognate institutions.

OLD ALMSHOUSES, QUAI VERT, BRUGES. FROM A WATER COLOUR SKETCH BY EDWARD HASTIE.

In some parts of Bruges there are to be found, in the last stages of decreptitude, yet withal quaint and picturesque, small groups of cottages or almshouses still inhabited by the aged poor. "Godshuisen" they are called, and they take us back to the days of the passing of Bruges. With the silting up of the waterways came the fall of the city and the dispersal of its commerce. Unemployment was rife and distress so prevalent that these almshouses appeared in large numbers and were quickly filled with the impoverished workers. They are still maintained in some measure by the Church and their inmates are an appreciable proportion of the population of the city. Each group has its own tiny chapel and some even aspire to architectural expression. Over the doorway of this example is a carved stone cartouche shewing a pelican feeding her young with the blood from her own breast.

R.I.B.A.

At the statutory examination held on the 15th and 16th October eleven candidates were examined for Certificates of Competency to act as District Surveyor in London, and one candidate to act as Building Surveyor under local authorities, the following passed, and have been granted by the Council Certificates of Competency to act in the respective capacities:—

As District Surveyors.

Frederick William Charles Barker, Stoke Newington, N.
Alfred Ernest Biggs, Ilford.
Henry Thomas Bromley, Lee, S.E.
Richard Thomas Grove, Wimbledon Park, S.W.
George Arthur Turner, Stoke Newington, N.
William Ernest Watson, Chancery Lane, W.C.

As Building Surveyor.

George Arnall, London, S.W.

Presidential Address.

(*Continued from page* 345, *No.* 717).

Of our noble museums and national collections we may be justly proud; yet an able writer tells us that these are having a baneful influence on modern art. There has been a resurrection of old forms and a tendency to copy, instead of seeking inspiration, and this checks creative power. This critic argues that Greek sculpture should not be considered away from its natural environment, nor Italian paintings away from the churches (often badly lighted) for which they were painted.

We have left many things undone, but we are treating our art treasures with respect. The accumulation of choice things at South Kensington we hope soon to see spreading through the noble Palace that Sir Aston Webb has, with so much wisdom and care, schemed for them; while at the British Museum spacious additions are now rising from the skilled hands of Mr. John Burnet. This work is begun in no mean spirit, for the imposing new facade will have a dignified approach (unusual in our buildings) by the clearance and rescheming of the adjoining property; this through the combined efforts of the ducal landowner and the County Council.

Turning from ancient things to new, we may be called upon to make a departure in design to meet modern construction in steel and concrete. The Romans were concrete builders, but they were not afraid of bulk, and their works, still with us, satisfy the eye with their proportion and substance. But the use of concrete has become a science; there is a Concrete Institution, and able men have made the finest calculations as to the work that may be done in concrete and ferro-concrete, with infinitesimal quantities.

We live in an age of hurry; groundrents are heavy, and a great commercial building must be erected in one year instead of three; thus steel-framed *construction* will be taking the place of *building*. We may now see such a steel structure in Oxford Street, a dry-goods store. Its foundations go down to the Twopenny Tube, and its roof is near the sky. This iron framework is now being enclosed with a gigantic order of columns which bring it within the laws of the Building Act and give it the aspect of a Temple.

The County Council have decided that next year we shall have a revised Act countenancing the thinness of walls that are not sufficient for their load in the new material.

Many of our colleagues are already building in the new method, erecting steel frames and filling in the spaces, the excuse being the saving of time. The buildings I have in my mind have been finished with architectural propriety, and the skeleton within is hidden and forgotten. But if this mode of construction becomes general, a style must be evolved adapted to it. It is not reasonable to make a show of stone walls, giving to the piers a comfortable width, when we know that the stone has no work to do. With our great adaptability, the eye and the mind may get accustomed to ferro-concrete posts and may credit them with their real strength. But shall we be satisfied without an apparent thickness and a breadth of wall-space for light and shadow? I am not anxious to anticipate so violent a change, and I trust it will not come about till my work is done.

The London County Council Technical Schools are to teach "architecture" in connection with their School of Building: and this will do good unless those gaining this elementary knowledge think they must thereby become architects, as, unfortunately, the bulk of South Kensington students feel they must become painters of easel pictures—a thing that was never intended when the schools were founded for training the taste of the artificer.

The growing interest in the crafts is quite a feature of our time, and it is interesting to find men with the higher education becoming workers in metal, gesso, and designers of stuffs and various decorative material.

In Scotland a Royal Commission was some time since appointed with the object of preserving ancient and historic monuments; and we are glad to say that a similar Royal Commission is now to interest itself in such memorials in England.

The Prime Minister has asked us to name an architect to serve on this Commission, and our able friend Leonard Stokes is to help in this cause. The intention is to schedule buildings and objects of historic or archæological interest, and to protect these from ruthless treatment or neglect.

The National Trust, on which we have a representative in Mr. W. A. Forsyth, is doing useful work on somewhat similar lines.

Following the decision of architects in Congress, we British architects have joined those of other nations in the demand that "architecture" be named with painting and sculpture in the scheme for international copyright. What value such right will ever have is difficult to say. Copyright at home would be worth more to us, but it would be hard to enforce. The gables of Scotland Yard have a broken pediment with an obelisk finial. It is so pleasing and piquant a feature that the form has been borrowed for various other gables that we see. It would never occur to the distinguished architect to demand a royalty from those who have employed this pediment; they would probably claim to have found their inspiration in the original Dutch gable. The ubiquitous copyist, though a nuisance, is a sincere flatterer.

I hope I am rightly informed in saying that the design of Mr. Knott, the fortunate competitor for the County Hall, has been revised, and is practically approved by the Council, with every chance of being carried out. We congratulate Mr. Knott heartily; he is to be one of our great architects, for opportunities make men. One is pained to think of the good men and true artists who have started with the qualifications for fine work, but on whom Fortune has never turned her face.

A matter that has been much discussed in this room for years past is the need for a comprehensive scheme for the changes that are always making in our great cities. We desire that the work of rebuilding, which never ceases, should be a part of one well-devised scheme anticipating the ever-increasing needs of a growing population. We might then have some day direct routes from east to west and north to south, fine approaches to our public buildings, and ready access to our parks and open spaces. New suburbs developed should be the result of forethought, instead of growing, as now, beneath the wand of the jerrybuilder. The Local Government Board is now framing a Bill to meet this great need, and our Royal Institute has addressed a letter to the President of the Board requesting that we may have "specific permission" to make representations and recommendations at inquiries held by the Board, before the approval of schemes for town-planning. We are all interested in the humanitarian side of this subject, but, as architects, we only ask to offer advice from the æsthetic or architectural point of view; endeavouring that new streets shall give fine vistas, being considered in relation to the public buildings or churches which they may pass in their route or to which they lead. The placing of public monuments and the laying-out of parks and their approaches are all matters about which judgment from the artistic side is essential.

We have already formed a small committee of men best qualified to help in this important matter, and they are putting in a definite form the principles that should rule, as well as their views and suggestions. Our Allied Societies will be invited to work with us; we shall thus be prepared to advise when our assistance is wanted.

Our Royal Institute is of venerable age, having enjoyed a Royal Charter for 75 years. The revised Charter for which we are applying is now before the Privy Council, and we hope it will be granted before the end of the year. Its main object is to secure that those practising architecture shall have gone through a proper training, having passed examinations as to their knowledge of building construction and studied the principles of design; but no examination will guarantee that a man is an artist in his calling.

Our by-laws we hope to improve, and especially in quickening the rotation of members on our Council. By shortening the period of service we shall enlist a larger number in our work, at the same time introducing young blood. I observe that those who are not with us in our deliberations are marvellously critical about our conclusions. I would have these sharing our duties. I believe in youth, and had there been a contest for the post of President I think my vote would have been for a vigorous young man.

The education of our future architects is, perhaps, the most important of our duties. The Board of Architectural Education was lately formed by men who were earnest on this subject, and it has done much towards bringing the various schools into touch, and to some extent to a common system of teaching.

But with these increased facilities for learning we may feel anxiety as to the future of the many promising youths who are gaining facility in architectural drawing. In earlier days, when the only method was to pay a premium of several hundred guineas and to be articled for four years, the choice of the calling was taken seriously, and there was some limit to the number of recruits. We are now daily declining applications from those who seek a place in an office and work for their hands to do. Our annual competitions for prizes show how many there are who can make a good set of drawings. The quantity is all-sufficient, and our effort must be to raise the *quality*, and especially to give a helping hand to the prizemen of most promise.

While new men are coming on and new names are added to our roll, we have to regret colleagues that have fallen out of the ranks. Among these are G. F. Bodley, E. W. Mountford, and John Stevenson, as well as Hugh Stannus, whose kindly presence had been so constant in our gatherings here. These all have been taken in the midst of their good work, for architects do not retire. Few of them can afford the luxury of idleness, and it would be found a poor exchange for the constant interest of our occupation.

Sir Aston Webb, in proposing a vote of thanks to the president, said that it was more than twenty years ago since he first met Mr. Ernest George, the occasion being an audience with regard to Mr. George's potential presidency. At the time, the speaker held the position of hon. secretary. He remembered he was shown into the presence, and Mr. George expressed his regret at his inability to comply. At length he assented, but wrote shortly afterwards withdrawing his promise, after which he again yielded. Mr. Ernest George had always done his utmost for the cause of architecture. With reference to the Town Planning Bill, Sir Aston described it as a sort of dual bill, as it included both housing and town planning. At the present time the Institute had no chance whatever of expressing an opinion upon it. The whole matter could be reduced to one point. Town planning was left in the hands of the Local Government Board, and decisions devolved upon its inspectors. He thought that the Institute should be recognised, and should be allowed the opportunities of stating its opinions. He trusted that the President of the Local Government Board would see to this. Turning to the ever-burning question of education, Sir Aston deplored the prevailing tendency to play for one's own hand, rather than to co-operate in a general scheme. Masters were naturally anxious to bring to a state of perfection their own particular school, and here, he thought, the governing body should step in. The Architectural Association had given encouragement to young men by offering a scholarship of £100. He thought it would be a great help if Universities could be provided with at least one scholarship from the Institute. The aspiring provincial could then come and study in London. The Institute was saving money, and could well afford it. He believed in encouraging and assisting architectural students to visit Rome and the Continent, and he hoped that some scheme with this object in view might be evolved. The Government might help the winner by finding him employment in a depart-

ment, or by placing him in charge of a building.

Mr. Reginald Blomfield, in seconding the vote of thanks, submitted the opinion that an architect should be in entire sympathy with his work. None could feel satisfied with the architecture of to-day. Possibly the next generation would reach the promised land. The public had to be educated, and this was a very difficult task. Ideals were certainly not as high as they should be. He had a high opinion of architects, but was not convinced of their capacity for pulling together.

The President briefly responded.

Notes and News.

The University College Calendar (University of London) for the session 1908-9, which has just been issued, is, from our point of view, chiefly noteworthy for the information afforded as to the curricula of the college in the fine arts, in engineering (mechanical, electrical, civil, and municipal), in hygiene, and more especially in the School of Architecture, of which Professor F. M. Simpson, F.R.I.B.A., is at the head, his assistant being Mr. Leslie Wilkinson, A.R.I.B.A. For the evening classes in architecture, the special visitors are Mr. Leonard Stokes, F.R.I.B.A., and Mr. Ernest Newton, F.R.I.B.A., while the instructor in the design classes is Mr. Cyril Power, A.R.I.B.A. The Calendar contains a set of plans showing the use to which the extension of the buildings is being put.

* * *

The historic house on Hampstead Heath, known variously as North End Place, Wildwoods, and North End House, is, it is stated, shortly to be put up for auction. The estate is mentioned in Domesday Book as Wildwood Corner. William Pitt, Earl of Chatham, retired to this house when stricken with the mysterious malady that necessitated his withdrawal from public life, and the room in which he secluded himself has still the same fireplace, hatchway, and cupboards as when he occupied it.

* * *

The alterations and improvements at Sandringham, which King Edward inspected recently, considerably enhance the dignity of the mansion. A new main entrance has been built, round which the new drive from the famous Norwich gates sweeps, and the old entrance is to be altered so as to lead direct to the gardens. Inside the house a redecoration has been carried out on an extensive scale, particularly in the Queen's private suite; and it was to see how this work had been carried out, and to ensure that everything should be in order, that His Majesty paid his flying visit to his old East Anglian home. Green and white are the prevailing shades that have been employed in these rooms. The new drive—the old one that was destroyed by the gales of last winter—is rapidly approaching completion. It is stated that the intention His Majesty had some time ago of building another storey to Sandringham has been abandoned since it is understood that York Cottage will shortly be available for its original purpose—to provide a bachelors' wing for the house when large parties are being entertained.

* * *

The King's birthday honours list, issued last Monday, contains nothing of interest from our special point of view, except the bestowal of a well-deserved knighthood on Mr. George J. Frampton, R.A., who has executed much architectural sculpture.

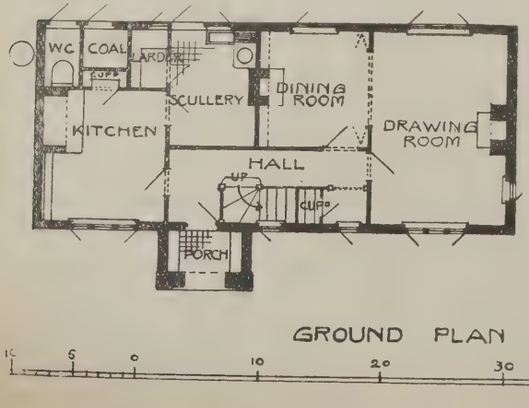
* * *

The proposal to connect Hull and Nottingham by means of a tunnel under the Humber is said to have been abandoned by the Hull promoters, in the absence of adequate support from Nottingham.

THE CONCRETE INSTITUTE.

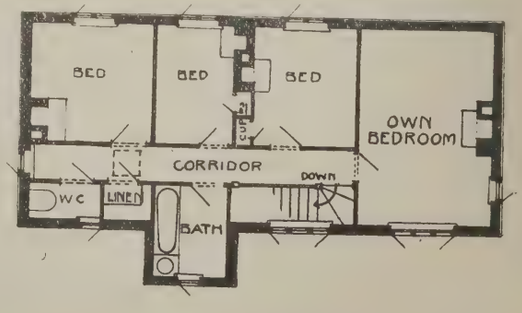
At a meeting of the Council of the Concrete Institute, Sir Henry Tanner, I.S.O., in the chair, it was decided that the first two general meetings of the Institute would be held at the Royal United Service Institution, Whitehall, on Thursday, November 19th, and Thursday, December 17th. At the first-named meeting a paper will be read by Mr. Marsh, M.Inst.C.E. (Assistant Engineer, Metropolitan Water Board), on "The composition and uses of Plain and Reinforced Concrete." At the second meeting a paper will be read by Mr. Wm. Dunn, F.R.I.B.A., on "The Examination of Designs for Reinforced Concrete Work."

It has been decided that when the membership of the Institute reaches 500, the present subscription of one guinea per annum shall be raised to two guineas per annum for members. The membership already exceeds 300.



Standing Committees have been appointed for:—(1) Science; (2) Parliamentary matters; (3) Testing; (4) Mass Concrete; (5) Reinforced Concrete Practice.

The temporary offices of the Institute are at No. 1, Waterloo Place, London, S.W., and all communications should be addressed to the hon. secretary, Mr. A. E. Collins, M.Inst.C.E.



COTTAGE AT CHELSFIELD, ORPINGTON, KENT. H. LAING, ARCHITECT.

This cottage, occupying a commanding site, and with views on the West towards Farnborough Hill, Knockholt, and Dunton Green, has been lately completed at a cost of under £400. The living rooms are divided by folding doors to allow of more space on occasion, and an attempt has been made to add interest to the somewhat severe interior by the sparing use of copper enrichments on the staircase newels, and Early English glass in the landing windows. The builders were Messrs. Wm. Owen & Sons, Farnborough Hill, Kent, and the Architect, Mr. H. Laing, 3, Bury Court, St. Mary Axe, E.C.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Nov. 14	WHITEHAVEN. NEW PUBLIC ELEMENTARY SCHOOL, Irish Street, for 700 children. Limited to Cumberland architects. Plan of site and conditions from W. D. P. Field, Secretary, Education Committee, Town Hall, Whitehaven. No statement as to premiums or deposit.
Dec. 1	POSTER FOR BUILDING EXHIBITION, OLYMPIA, April 17th to May 1st, 1909. Premium £105. Open to Architects and Architectural Students only. Particulars and entry forms from H. Greville Montgomery, M.P., Exhibition Offices, 43, Essex Street, Strand, London.
Dec. 14	§BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos, Town Clerk, Town Hall, Blackpool. Deposit £1 1s.
Dec. 19	WHITTINGHAM. ANNEXE TO ASYLUM FOR PAUPER LUNATICS, for the Lancashire Asylums Board. Limited to Architects who are in practice and are ratepayers in the County of Lancashire. The new building is to accommodate 700 Inmates. Premiums of £100, £50, and £25. Particulars and plan of site from Leonard Colman, Law Clerk to Committee of Visitors, 8, Lune Street, Preston. Deposit £5 5s.
Dec. 31	*CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50, £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council, Bodmin. Deposit, £1 1s.
No date.	SWINTON. New Schools in Cromwell Road for the Swinton and Pendlebury U.D.C. Limited to Architects having offices within ten miles of Manchester. Premiums of £50, £25, and £10. Instructions may be obtained by letter on or before November 5th, to W.T. Postlethwaite, Council Offices, Swinton, Manchester.

* *These competitions have been unfavourably reported upon by Correspondents.*

§ *The Council of the R.I.B.A. advises Members not to compete.*

International Architectural Competitions.

We reported in our issue of September 9th the twelve resolutions relating to International Architectural Competitions which were brought forward and approved of generally at the International Congress held at Vienna last May. At a subsequent meeting of the International Permanent Committee, the British representatives (Mr. Leonard Stokes and Mr. John W. Simpson) proposed that, in order to render the resolutions really effective, the various nations adherent to the Congress be afforded an opportunity of considering and confirming them. The proposal commended itself to the committee, and on the motion of Mr. Simpson, a resolution was passed that a copy of the resolutions be sent to each section of the Permanent Committee with a request (1) to consider them in detail, and return them to the Secretary-General (M. Poupinel, Paris), with any observations thereon; (2) to appoint one member of their section to meet the other delegates at Paris with full powers to discuss the resolutions and settle a final and definite report which should be held to express the views of every nation represented on the Permanent Committee. As it was particularly important that the delegate appointed to attend the meeting at Paris should be fully informed as to the views of British architects on the subject, copies of the resolutions were sent from the Institute to the Competitions Committee, and to the various Allied Societies, with a covering letter inviting suggestions and observations on the resolutions to be sent to the Secretary of the Institute not later than the 30th September. The replies of the various bodies were duly received and collated by the R.I.B.A. Competitions Committee, who added their own observations and sent the whole in the form of a report to the British section of the Permanent Committee. At a recent meeting of this section the report was adopted and Mr. John W. Simpson was selected, and has consented, to act as delegate to represent the views of British architects at the meeting of the International Commission to take place at Paris on the 19th November.

DESIGN FOR A BUNGALOW. E. H. BUCKNOLE, ARCHITECT.

This bungalow is so planned that the kitchen and offices are kept well in the background, though, at the same time, being not far from the front door. The ground floor bedrooms also are quite away from entrance hall. Hand-made, sand-faced roofing tiles, brick and roughcast and oak half-timbering, are the proposed materials of construction, whilst the large chimney-stacks form a distinctive feature.

Blackpool Library Competition.

We have received the following letter from an Irish architect:—

SIR,—The belated action of the R.I.B.A. in reference to above will presumably have the unpleasant effect for those who obey the ban of causing their entrance fees to be retained by the promoters. There seems quite a possibility of public bodies, and even individuals, being able to make quite a good income in this way, so long as the Institute Competitions Committee delays action until after the competitors have paid their deposits, and are well on with the schemes. Surely it is due to the members of the Institute and allied bodies, that all doubtful competitions should be dealt with with the utmost promptitude.

AN M.R.I.A.I.

ADDITION TO THE G.P.O., DUBLIN.

There are few visitors to Dublin who are not acquainted with the General Post Office, extending along Sackville Street from Henry Street to Prince's Street. Sackville Street has the great width of 150ft., and is one of the finest thoroughfares in any city of the world. The authorities lately acquired some old property in Prince's Street, and on this site the proposed works are to be carried out, the present front building not being interfered with. The extension consists of a new block 56ft. in length, faced with Ballyknocken granite, having a heavy cornice and balustrading to correspond with the style of the existing buildings. The new building, which is four storeys high, will have a depth of 120ft. The basement at rear will be used for workshops; the two large rooms on ground floor for a sorting office and postmen's room, and the other floors for various offices. The floors are to be carried on steel stanchions, and roof will be of reinforced concrete (expanded steel being used as a reinforcement), covered with Limmer asphalt. The architect for the work is Mr. Robert Cochrane, I.S.O., LL.D., F.S.A., Board of Works, and the quantities have been prepared by Messrs. Patterson and Kempster. The estimated cost will be close on £20,000, and a large number of Dublin builders, as well as some from Cork, Belfast, and England, lodged their tenders with the Secretary, Board of Works, Dublin, on the 2nd inst

Contractors' Notes.

The case of Smithies v. the National Association of Operative Plasterers came before the Court of Appeal last week. It will be remembered that the plaintiff, a master plasterer, of Birmingham, claimed damages and an injunction against the defendant union, its trustees, and Mr. Duckett (the Birmingham branch secretary), for combining to call men employed by the plaintiff out on strike, causing them to break their contracts, and procuring them not to make fresh contracts. Plaintiff also claimed damages for breach of contract against two workmen named Ecclesby and Forrester, who were under long contracts of service with him. The latter claim succeeded, £25 damages being assessed against each of the defendants, but the Lord Chief Justice held that the plaintiff had no remedy against the trade union, its trustees, or Mr. Duckett, and it was from this part of the judgment that the plaintiff now appealed. A preliminary point as to the retrospective effect of the Trade Disputes Act, 1906, was disposed of, and the appeal proceeded with. Mr. Montague Lush, K.C., and Mr. H. A. McCardie appeared for the plaintiff; Mr. J. A. Simon, K.C., and Mr. Clement Edwards for the defendant association and its trustees; Mr. Montague Shearman, K.C., and Mr. Ernest Wild for the defendant Duckett. At the conclusion of the arguments, their Lordships reserved judgment. We propose to publish a summary of the arguments and the judgment when the latter has been delivered.

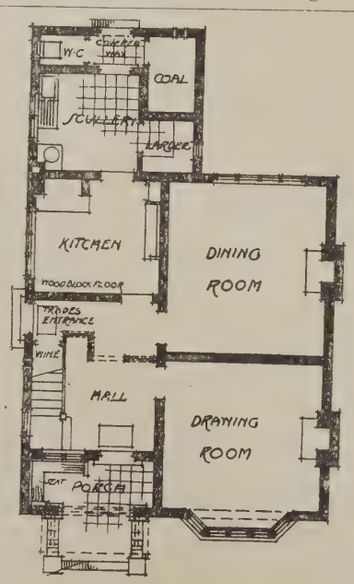
* * *

A correspondent of the "Birmingham Daily Mail" has drawn attention to the large amount of Swedish joinery now being imported. Mr. A. W. Turner, President of the Socialist Fair Trade Party, replies rather sharply that: "So long as the building trades boomed, carpenters, and builders seemed to take the receipt of manufactured joinery from abroad as a matter of course, expecting that 9½d. an hour could be paid for fixing the imported joinery. That was all right during the boom, but cannot be all right for ever. The next stage will be the fixing of the joinery by youths and women at 4d. to 5d. an hour, and how can the Carpenters' Trade Society prevent that new departure? The Liberal Unionists have spent a lot of money merely enrolling middle-class non-artificer Liberals into Unionism of the type that supports Tariff Reform, but have lost sight of the fact that Radicals and Socialists still support what they term Free Trade, namely, free imports. When somebody spends, say, £100,000 in converting Socialists to Fair Trade, the necessary new tariff laws will be passed. The time and money now devoted to lectures and various methods of propaganda by the Liberal Unionists, being spent on the wrong section of the electorate, is simply wasted."

* * *

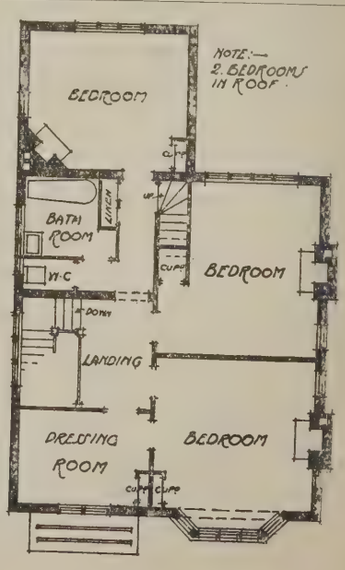
Grimsby Master Builders' Association.—At the last meeting of this Association, the following resolution was unanimously agreed upon:—"That this Association regret the delay in constructing a direct road from Grimsby to Immingham, and they hope the Town Council will do their utmost to expedite in every way a road being made as early as possible."

In the London Lord Mayor's Court, during last month, before Mr. Assistant Judge Jackson and a jury, Foster and Dicksee, Ltd., contractors, were sued by William Sellers, a general labourer, for damages for personal injuries.—For the plaintiff it was stated that in April of the present year he was out of work and went to the City looking for employment. He heard that the defendants were building premises in Lower Thames Street, and went there. At that time the workmen were at dinner, and he waited till they resumed. When the men returned to work, the plaintiff, together with a number of others who were out of work, also went in with them. They all went up a temporary staging towards the foreman's office, it being alleged by the plaintiff and his witnesses that this was the usual practice followed when men were seeking to be engaged. While a number of the men were on the staging, it suddenly collapsed, and the plaintiff, with many others, was precipitated into an excavation some 10ft. or 15ft. below. Both his legs were broken, and he was seriously and permanently injured. In all, about eleven men were injured by the collapse of the staging, and it was admitted that other actions were pending the result of the present case.—The defendants' counsel submitted that he had no case to answer, as his clients were not under any duty to the plaintiff. Negligence could only be a cause of action when the person alleged to be negligent had a duty to the person injured. The plaintiff and others were trespassers, and the staging collapsed through too many men being upon it. The staging was quite strong enough for the purpose for which it was erected. With one, or possibly two exceptions, all the men who were injured were men seeking employment.—In summing up, the judge left two questions to the jury to decide—(1) Was there any invitation or licence expressed or implied to the plaintiff to go on to the premises? and (2) were the defendants guilty of negligence?—The jury, after a lengthy consideration, failed to agree on either question submitted to them, and were discharged.



The annual meeting of the Sheffield Building Trades Exchange was held on Tuesday evening, November 3rd, the president, Mr. A. J. Forsdike, in the chair. The annual report and balance sheet disclosed a most satisfactory state of affairs, 63 members having been admitted during the year, the membership at date being 278. The financial statement showed that the club had just completed its most successful year. Every department showed advance, and all arrears of previous years had been wiped out, and a balance left to credit of profit and loss account, despite the fact that some £28 of extraneous expenditure, which might have been debited against subsequent years, had been written off out of current revenue. The takings were more than £100 in excess of previous financial year, and the subscriptions collected, which, like all other items, constituted a record, were £37 4s. up.

Mr. A. J. Forsdike was re-elected president, and Messrs. T. Roper and G. E. Powell were re-elected vice-presidents for the ensuing year, while Mr. J. D. Cook was re-elected treasurer for the sixth time in succession.



Our Plate.

The new bridge over the River Wear at Sunderland is the subject of a separate note elsewhere.

The exterior of the house in Nelson Road, New Malden, is carried out in white rough-cast, and the roofs are covered with red sand-faced tiles. The external painting is of an apple-green colour, with the exception of the porch, which is of Oregon pine, stained with dark-brown Solignum. Internally, a feature is made of the hall, which is lighted by a stained-glass window by George Wragge, Ltd., and is panelled to match the panelling of the staircase. The woodwork of the dining-room is of walnut; the other rooms have deal painted white. All details have been studied with due respect to simplicity and economy. The builder for this work was Mr. H. F. White, Kingston Road, New Malden. The architect was Mr. Harold Kemp, of 29, Malden Road, New Malden.

Correspondence.

Swinging Radiators.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In the description of the new Manchester Royal Infirmary in your issue of October 28th, the following passage occurs:—"The originality of the swinging hot water radiator and the question of the constant wear and tear on the bearings owing to the weight of metal and water, are matters that are being watched with great interest by heating firms and architects." The meaning of this paragraph is plainly that the use of swing coils for hot water work is new and original, the inventors being presumably the architects of the hospital. The first swing hot water coils that were ever used were made in 1893 by Messrs. Slater and Co., and were put in under my direction at the Middlesex Hospital, where they have been working ever since. Since that time many swing coils have been used not only in England but in America, and the original design of Messrs. Slater has been freely pirated. A notable example of the use of swing coils is at the Derbyshire Royal Infirmary, where they are used, not for hot water, but for steam. Architects and heating firms have, therefore, had ample opportunity of studying the "question of wear and tear." KEITH D. YOUNG.

Cleaning down old Stone Buildings.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—As a Clerk of Works and stonemason by trade, I think I can answer the enquiry in last week's issue under the above heading. Whether you clean down the face of stonework by the old-fashioned method of scraping or by the sand blast or steam brush processes, the cleaned face offers less resistance to atmospheric conditions; consequently it shortens the life of the stone—it is like taking a Turkish bath: the pores of the skin are opened, and if brought into contact with sudden changes of temperature, the results are serious. With regard to a protective coat or solution for coating the stone after cleaning, I have tried most of those now on the market, but although a few protect the face of stone for a time, the treatment requires to be repeated fairly often.

Penge, S.E. R. CAMPION.

The L.C.C. and the District Surveyors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am sorry that a paper so well conducted as THE BUILDERS' JOURNAL should have published a leader based on the cheap wit of unprofessional journals, as to the London County Council taking proceedings against itself. The action is by the District Surveyors' Association (Incorporated) against the Council, as a test case to ascertain whether the Council's schools are exempt from the provisions of the London Building Act, 1894.

HENRY LOVEGROVE, President,
District Surveyors' Association
(Incorporated).

The Architectural Profession To-day.

SIR,—I should like to say a word or two in reply to "Regular Reader" on the above, which appeared in your issue of Oct. 21st. He says that out-of-work architects and assistants ought to bind themselves together and approach our councillors with a view to their inserting in our by-laws "That *all* plans submitted to the council be prepared by architects. Now, Sir, this may seem logical enough to some on first sight, but let us look at it and see how it is going to react on some members of the building trade in general. Take a case of a man living in his own house. He thinks he can improve his premises by doing a little alteration in the shape of a new W.C. or wash-house. He is able to put his ideas on paper, and in such a manner as to conform with the building by-laws. Then I say how can "Regular Reader," or any other who is fair-minded, think it just to coerce a bricklayer, joiner, or plumber into engaging an architect for a paltry bit of an alteration? No doubt something in the direction indicated could be arranged, as, for instance, a clause to the effect that no plans be accepted for consideration by town councils where the cost of such buildings or alterations exceeds, say, one or two hundred pounds, unless prepared by bonafide architects. This would be much fairer, to my mind, towards the working class than that submitted by your correspondent. Again, he states that makers of building materials might possibly be approached in the interest of the profession. All well and good if this can be arranged, but again I must join issue with him. Makers of building materials, like the makers of anything else, do not care whom they sell to nor yet how much, so long as they get their money. I trust we may hear something further on architects' clauses in council by-laws from some others of your readers who are members of the building trade.

A BUILDER.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
The querist's name and address must always be given, not necessarily for publication.
Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Manchester New Royal Infirmary.

MANCHESTER.—INFIRMARY writes: "I read with much interest your article on the above in THE BUILDERS' JOURNAL, and observed that there was no mention of a surveyor. I hardly think that in the case of a large contract like this, there would be no quantities taken out. Can you inform me in your correspondence columns as to whether the architects took the whole job through completely, or if an independent surveyor took the quantities. If the latter be the case, can you tell me who the surveyor was?"

Some of the personalia in connection with the Manchester Royal Infirmary were omitted, owing to exigencies of space. Mr. William Windsor, of Manchester, was the quantity surveyor; Messrs. Miller, Wilson, and Pegg, Manchester, were advisory engineers to the architects for electrical work; and Mr. Ed. G. Hiller, Manchester advisory engineer for the boilers and steam pipes. Mr. Alfred Turner was chief clerk of the works, and he was assisted by Messrs. F. Wilde and R. Patterson.

Telephone Wires Crossing Property.

DULWICH.—E. T. C. writes: "I have recently been appointed surveyor to an estate consisting mainly of house and shop property in a provincial town. The National Telephone Co. has carried over head wires across several parts of the property without having obtained wayleaves. The local manager strongly objects to applying for way-leaves, and contends that they are only needed for fixings. This is surely incorrect, and if acquiesced in would lead to easements, which, in view of the development of aerial navigation, etc., ought not to be allowed. I do not wish to threaten without being able to support words by action, if driven to do so. Can I safely give the Company notice to remove the wires within a reasonable time, or obtain a proper way-leave, and if they do not do so, cut the wires (or throw a wire over them), and so upset the service without doing any damage?"

The Telephone Company possess no statutory powers enabling them to enter upon any person's property without first obtaining permission, and you may deal with them as trespassers in a very summary way—if you so choose—by removing or cutting their wires or stays, etc. (taking care not to damage their property unnecessarily). I have, however, always found the Company you name are quite willing to enter into fair wayleave agreements where necessary, and I advise you to communicate with them before taking the extreme step of removing their connections. The amount of wayleave they should pay for each fixing depends upon its importance, one shilling per annum being the minimum rental and five shillings a fair sum for town work; in important cases it must, of course, be a great deal more. It is not usual to ask for wayleave for the fixings necessary for the use of a telephone in the particular building to which the attachment is made. You should take care that the wayleave agreement gives you power to terminate it on reasonable (say six months') notice, and that there is no indemnity clause placing liability upon you for damage caused by the poles or fixings, whether accidental or otherwise.

F.S.I.

Questions on Paints and Painting.

LEIGH-ON-SEA.—L. M. writes: "Is there any simple way of ascertaining whether white lead, linseed oil, and turpentine are pure? What is the best way to test ready-mixed paint? Some woodwork painted a bright red some time ago has now been finished with white enamel. For some inexplicable reason, the red is eating its way through the enamel. Please state cause and remedy."

White lead can be examined for purity by anyone who can use a blow-pipe. Place a small piece of the lead, the size of a pea, in a little cavity made in a piece of charcoal, and direct the blue part of the flame upon it. In a few minutes the sample will, if pure, be reduced to metallic lead, while no amount of blowing will have this effect if it is adulterated. There are several other tests which require some knowledge of chemistry, and the querist may be referred to an excellent book on the subject, entitled "Simple Tests for Painters' Materials," by A. C. Wright, M.A., B.Sc., published by Scott, Greenwood, and Son, 8, Broadway, Ludgate Hill, E.C. White lead when pure is put up in packages, marked "Genuine White Lead," and when such a mark exists and the package is unbroken, it almost invariably means that the contents really are pure. Adulterated white leads are marked either "Reduced White Lead," or "No. 1," or "No. 2," white lead. If you are unable to see the packages, and are still suspicious, demand to see the invoices, and note whether "Genuine" is used, or take a sample to a pharmaceutical chemist, and he will, for a

very small fee, be able to determine the question of purity for you, because lead can be analysed by any chemist, whether he has any special knowledge of paints or not. The testing of linseed oil and turpentine for purity requires considerable technical knowledge. Both are exceedingly difficult articles to deal with, especially the latter, which is now largely adulterated. Mr. Wright's book, above mentioned, gives the principal tests. The case of red penetrating through a superimposed coat of white enamel has frequently been met with during recent years, since the new reds or vermilionettes have been placed on the market. These reds are made from anilines, although there are one or two which are guaranteed not to "bleed"—the technical term for this defect. The red paint should have been removed before the white enamel was applied, and probably the cheapest method now would be to remove both. Two coats of shellac varnish, *i.e.*, the best grade of "knotting," given to the existing work, with a coat of enamel over, may prevent further trouble, but some grades of red will bleed through these. Messrs. Goodlass, Wall, and Co., Ltd., of Seel Street, Liverpool, have a special preparation or varnish, which is claimed to prevent bleeding, and this might be tried.

J.

Books on Romanesque Architecture.

ALDERSHOT.—"ROMANESQUE" writes: "Kindly name a good book on Romanesque architecture."

The term Romanesque is often rather loosely applied, but there appears to be no existing book obtainable which treats the whole subject relatively in its various phases, though Ferguson's "History of Architecture" gives the outlines. If English Romanesque is wanted, "Gothic Architecture in England," by Francis Bond, M.A., published by B. T. Batsford, 31s. 6d. nett, deals well with this; and the same author's "Classification of Romanesque Architecture," published in the R.I.B.A. Journal for November 21st, 1898, is also useful. Other books are Ruprich-Robert's "L'Architecture Normande aux XIe. et XIIe. siècles en Normandie et en Angleterre"; F. de Dartein's "L'Architecture Lombard"; and, if the classification be stretched to include Byzantine, Choisy's "L'Art de bâtir chez les Byzantines."

G.

Geometry for R.I.B.A. Students.

LEEDS.—D. B. writes: "Please give particulars of books dealing with 'Descriptive Geometry' or 'Projection of Solids,' suitable to work from, for the Intermediate R.I.B.A. examinations."

The books to be mentioned first in dealing with this subject must necessarily be those given in the List recently published by the Joint Committee of the Board of Examiners (R.I.B.A.) and the Board of Architectural Education. These books are as follows:—Binns, W. S., "Geometrical Drawing." 1864; Davidson, E. A., "Practical Perspective," 1886; McGoodwin, H., "Architectural Shades and Shadows," 1904; Spanton, J. H., "Science and Art Drawing," 1895. But it must be pointed out that it is by no means essential to procure, or even refer to more than one book if the enquirer has no further object in view than to pass the Intermediate examination, and for this purpose any of the ordinary inexpensive text-books, if properly studied, will be found sufficient. In the examination in question, the scope of this subject is, practically speaking, only such as is necessary for any architectural draughtsman in his daily routine, the questions being almost confined to (*a*) the simplest projections and sections of the simple curved and polygonal solid bodies and their interpenetrations; (*b*) the correct projection on plan of roofs with sides of varying pitch, together with the drawing of such sections as a quantity surveyor would need in obtaining the correct lengths of all the timbers, including those forming a curb or trimming around openings of various shapes; (c) the geometrical setting out of curved structures, *e.g.*, geometrical stairs and round-headed openings intersecting with straight or curved splays, curved handrails, etc.; (*d*) isometrical projection of simple solid bodies and structures; (*e*) the setting out of the curves formed by sections of the cone, and the practical application of the ellipse, together with occasional questions on mensuration of simple surfaces, such, again, as would be needed by any quantity surveyor. No questions have recently been set involving a knowledge of the methods of casting shadows, but sciagraphy is, of course, a necessary branch of study for the finished architectural draughtsman (McGoodwin's book on this subject costs 15s. net). The book I have found most useful in dealing with the subject of geometry and projection of solids is Angel's "Practical Plane Geometry and Projection" (7s. 6d. nett), as the plates are large and clearly drawn and figured. Such small and inexpensive text-books as Gill's "Imperial Geometry," in two volumes (1s. 4d. each), will serve the purpose where more expensive books are unattainable. The enquirer might refer to the number of this journal for August 8th, 1906, for a series of worked examples to the questions set at the preceding examination.

B. B.

Proposed New Works.

Aberdeen.—The Plans Committee of Aberdeen Town Council, at a recent meeting passed plans of the following buildings:—Dwelling-house on the west side of Burns Road, for Mr. John Buchan, builder; alterations and additions in connection with stable on the west side of Diamond Street, for Mr. Henry Ross, per Messrs. Watt and Davidson, architects; oil tank in yard on the north side of St. Peter Street, for the Pumpherston Oil Co., Ltd., per Mr. William Walker; two dwelling-houses on the south side of University Road, for Mr. George Garden, per Mr. John Milne, architect; six dwelling-houses on the west side of Sunnyside Road, for Mr. Joseph Shirras, builder; addition to fish-curing premises on the north side of Poynernook Road, for Mr. John Bordie, per Mr. James Park, builder; additions to premises No. 96, Huntly Street, for Messrs. W. and A. Hay, cabinetmakers.

Bournemouth. — At a recent meeting of the Buildings Committee, the plans recommended for approval comprised those for the erection of about seventy houses, besides a large number of additions and alterations.

Broadstone, Dorset.—The church is to be enlarged, and funds are being collected for that object, the cost being estimated at about £700. Sketch plans have been prepared by Mr. Walter J. Fletcher.

Chorley.—The Town Council has authorised a sub-committee to enquire and report as to a suitable site for the erection of public baths.

Christchurch, Hants.—The Guardians have formulated their reply to the criticisms of the L.G. Board on their proposed new infirmary. The Guardians adhere to their proposals as being sound and therefore economical.

Cockerham, Lancs.—It is proposed to restore the ancient parish church of Cockerham. A new roof is urgently required. The tower is mediæval, but the rest of the church was rebuilt, in Georgian style, in 1814, when Mr. Parkinson, the architect, made an interesting discovery. He found on the tower wall, above the existing ceiling, the ridge of the roof of the earlier church, much steeper than the present one, with an arched opening or window in the old gable, now blocked by the tower wall—indicating that the earlier church was in existence before the tower was built.

Dorset.—Two schemes of church extension in Dorset, in addition to the erection of the new church of St. Martin at Weymouth, are being started. One is to complete the church of St. Paul Westham, a suburb of Weymouth, at a cost of £3,000, and the other is to erect a church, with parsonage, to serve the Canford Cliff and Sandbanks district, for which an acre of land on the Choddesley estate has been offered by the Rev. Hugh Pearson.

East Grinstead, Sussex.—The County Education Committee is proposing to build a new elementary school here.

Hornsey.—The borough have approved plans for the following:—Six dwelling-houses in Berkeley Road, Crouch End, by Mr. F. Cottrell; amended plans for two dwelling-houses in Fortismere Avenue, Muswell Hill, by Mr. W. J. Collins; plans for three dwelling-houses in Stanhope Gardens, Highgate, by Mr. F. Collins; plans for alterations in and additions to No. 162, Stroud Green Road, by Messrs. Richardson and Gill; plans for fourteen dwelling-houses in Connaught Gardens, Muswell Hill, by Messrs. Eyles, Lewis, and Co., of 85, Gresham Street; amended plans for seventeen dwelling-houses in Southwood Lawn Road, Highgate, by Mr. A. G. Shearing, of No. 12, Fortess Road, Kentish Town; plans for alterations in and additions to "Hollydene" Cholmeley Park Highgate; plans for addition to "Sarnesfield" Bishopswood Road, Highgate, by Messrs. Southcott and Co., Highgate; plans for alterations in and additions to No. 8, North Hill, Highgate, by Mr. G. Green; plans for eight dwelling-houses in Oak Avenue, Hornsey, submitted by Mr. C. W. Boswell, 6, Redston Road; plans for six dwelling-houses in Hornsey Lane Gardens, by Mr. J. C. Hill, 14, Archway Road; plans for the laying out of the Northwood Estate, Hornsey Lane, Highgate, by Mr. J. C. Hill; and plans for dwelling-house in Creighton Avenue, Muswell Hill, by Mr. C. Tucker, of Page's Lane.

Littlehampton.—A shelter is to be erected on the Green. The Duke of Norfolk has given the site for it, and a right of road to it.

London.—An important scheme of restoration and repair, it is stated, is under the consideration of the Dean and Chapter of St. Paul's Cathedral, London. The committee of architects, whose report resulted in the great main sewer which was to have been constructed under the cathedral being diverted, have submitted a number of recommendations, the carrying out of which will cost at least £16,000. Suggestions are made for increasing the stability of the fabric at a number of points, and considerable repairs are proposed. Improvements in the heating arrangements are also recommended. The Dean and Chapter are in favour of carrying out the scheme of the committee, and they are now in communication with the Ecclesiastical Commissioners with the object of obtaining a grant towards the expenditure.

Manchester.—The Y.M.C.A building in Peter Street is to be demolished, to make way for a new structure.

Newquay.—An appeal is being made for £10,000 for the Newquay New Church building fund, towards which £3,400 has been paid or promised.

Nottingham.—The Education Committee have decided to erect a new school in Haydon Road, Sherwood, for 1,620 children; the schools to be erected in two blocks. They are also purchasing 1,200 square yards of land, at a cost, including roadmaking, of £700, for the enlargement of Berridge Road school; and the house and grounds adjoining the Clarendon Street school, for the future enlargement of those buildings. The house will at present be used as a centre for the medical examination of children.

Southall.—A site has been secured for the construction of a new church, to be called St. John's, at Southall, and the building operations will be begun shortly.

Sunderland.—At a meeting of the Building Committee held in the Town Hall on November 2nd, there were sixteen plans to consider, and among those approved were:—House, St. Alban's Street and St. Leonard's Street, H. E. Robinson, for T. Golding; two houses, St. Leonard's Street, H. E. Robinson, for R. Oliver; warehouse, Halsgrove Street, W. and T. R. Milburn, for Steel and Co.; and house, Sandringham Terrace, Monkwearmouth, John Batty. There was also a plan for the branch library in Church Street North, Monkwearmouth, the consideration of which was adjourned.

Swansea. — The Swansea General Purposes Committee have had submitted to them draft plans of the proposed new art gallery which Mr. Glynn Vivian is presenting to the town, and Mr. Moxham, the architect, has been instructed to indicate how the structure of the buildings will compare relatively with the existing buildings in the vicinity. The estate agent has submitted plans for laying out the Town Hill estate of the Corporation, allocated to the garden city scheme. The cost of roads, footpaths, and main sewer will work out at 35s. per house. The rent will be at the rate of £18 per acre, and it is proposed to erect 18 houses per acre.

West Ealing. — Plans have been passed for the completion of the Church of St. James, by the addition of a chancel.

Yarmouth.—The Guardians are about to proceed with a scheme of alterations at the workhouse at a cost of about £6,000.

York. — The Local Government Board have sanctioned the borrowing of £12,205 for building here a new secondary school for girls. The education committee have allocated £500 as the cost of levelling and preparing the site, for which the distress committee will provide the labour.

CONTRACTORS' SECTION

(MONTHLY.)

FRENCH SCAFFOLDING.

Some Impressions, and a Comparison with British Methods.—*(Continued).*

By A. G. H. Thatcher.

Figues 11, 12, and 13 give illustrations of most of the points mentioned; the first two are of buildings in Rouen, and the latter were taken in Paris. Fig. 11, as an exhibition of scaffolding, would be viewed with suspicion by most English workmen. Fig. 12 is of a far better type, but, nevertheless, falls far short of perfection from our point of view. Note may be taken from this photograph that the customary tub is not in use as a base to the standards, but reliance is placed upon a mortar bed.

Fig. 13 is a good illustration of the manner in which possession is taken of the pavement, and no provision made for the foot passengers. The photograph was taken in the centre of Paris, in by no means a quiet neighbourhood. Gantries and guarded footways, as provided with us, are evidently not deemed a necessity. Another instance of light scaffolding was erected on the east front of the Luxembourg Palace. Although the whole scaffolding was about 60ft. in height, the same lightness of construction was noticeable as in the smaller erections. This cannot be due to the absence of weighty material, for heavy blocks of stone were raised in the tower here.

So far as the safety of the workmen is concerned, due regard is paid to the ordinary rules of caution. A guard rail is very generally seen fixed, and this, together with a single board on edge, is relied upon to safeguard most platforms. Where the public traffic is to be considered, additional edge boards are fixed, even to the height of six or seven feet, completely casing the platform in. The fan guard does not find a ready acceptance, but occasionally one may be seen over entrances.

Braces are only fixed in such places where the scaffolding is in exposed situations. Tie pieces to keep the framework from falling away from the building are regularly fixed, but in a somewhat haphazard fashion.

With the dependent type of scaffolding, the inward end of the putlogs, where they happen to fall against a window opening, are simply tied to a prop, as shown in Fig. 14. The bridle system of getting over this difficulty is certainly stronger, but providing the scaffolding does not move at all, and the putlog is tied at each end, the French method answers its purpose.

Among the many minor details of scaffolding may be noticed the use of cripples, trestles, wall brackets, ladder scaffolds, and boats. The cripples are practically identical with those used here, but of trestles there are a greater variety, although used for much the same purposes. Fig. 15 is an illustration of one, which, when used in pairs, allow of a good platform to be laid for painters and plasterers. Fig. 16 is an illustration of an appliance which is similar in appearance to the ladders used by our window cleaners, with the difference that the sides do not meet at the top, but are about 12in. open. This opening, however, varies, and for a deliberate purpose. By fitting a pair together, as shown in Fig. 17, and bolting through, a serviceable trestle results, which has the advantage of a considerable base.

The Scottish wall bracket, which has met with severe condemnation on account of its dangers, has also its prototype, but a difference is made in the method of fixing. The northern bracket is fixed by a spike through its back plate. Consequently, the joint made with the wall cannot be seen. A practical man will appreciate the disadvantages of this. Our southern neighbours have got over the difficulty in this manner. The spike is first driven into the wall, and if a good connection results, the bracket is hung from it by cordage (Fig. 18). To get over the tendency to roll, a scantling is nailed at right angles to the back plate, and by thus widening the area of pressure, the arrangement is kept safe. A scaffolding on this principle was seen in Dieppe. It was fitted with a guard rail and edge boards, and served good purpose for the light work it was erected for.

Ladder scaffolds at the present time are

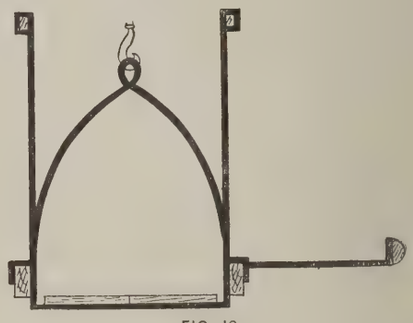

FIG. 19.

much in vogue, especially for examinations and repairs. They are on the same principle as those which were seen in London a few years ago, but which for some unaccountable reason went out of use, although, if rumour speaks correctly,

(To be Concluded.

NEW BRIDGE OVER THE WEAR AT SUNDERLAND.

The heaviest independent span for a bridge has now been completed over the River Wear at Sunderland. The bridge has two decks, the upper carrying the North Eastern Railway, and the lower the public roadway. The weight was three times that of the Forth Bridge central girders. The problem set for the builders, Sir Wm. Arrol and Co., of Glasgow, was to construct in position this immense bridge span without interfering with the river traffic, and they applied in a new way the well-known cantilever principle, which is embodied in the Forth Bridge. Having completed the 200ft. span, forming the approach of the main river crossing of 354ft., the great towers were set up, the right arm steel ties taking support from the approach spans, while the left arms, also of steel sinews, supported the girders of the river span as they were constructed bay after bay, from the ends of the land span. Some idea of the magnitude of this temporary steel work will be appreciated by the fact that it weighed over 800 tons, while the weight supported by the arms was 2,600 tons. For seven months an army of workers have been busy building this girder work into space from each end, and eventually the projecting ends met. Natural phenomena were important factors in the meeting of the centre arms. Every detail of the work had been designed with great precision to ensure accurate meeting when the temperature was 60 degrees F. Great variations, such as have been experienced in our recent summer, might have involved difficulties. Observations had shown that the ranges in recent days caused expansion and contraction of the metal to such an extent that the projectings ends rose and fell about ½in. to ¾in., while on hot days the ends moved laterally from the sum as much as 1½in. Provision was made so that if the day were abnormally hot or cold, the whole structure could be tilted or moved longitudinally, so that the ends would meet. Nature assisted so far, that although there was a cool S.E. breeze, the sun at noon gave sufficient warmth—the thermometer showed about 60 degrees F.—and thus there was gradual expansion, and the holes in the heavy connecting plates were exactly in line with the corresponding holes in the heavy connecting plates were soon a great array of bolts were put in, and later, were replaced by rivets, and thus the two projecting brackets became a complete unit. Credit for this precision in the scheme of operations is again shown by the fact that the girders are 42ft. high and that they are 32ft. apart.

The bridge, which has been designed by Mr. Charles A. Harrison, the chief engineer of of the N.E.R. Co., is, in other respects, interesting. It is, with its approaches, 1¾ miles long, and has cost about half-a-million sterling. The foundations are of great depth. Like those of the Forth Bridge, they consist of great steel boxes 63ft. long by 35ft. wide, sunk by air pressure to a depth of 75ft. below high water. While they were being sunk, the superstructure of granite was being built on the top, and thus the mass, sunk through silt to the rock bed, ultimately became 16,000 tons in weight. The steel work used totalled about 10,000 tons, the granite 32,000 tons, the sandstone 60,000 tons, and large quantities of bricks and other material.

Sir William Arrol took a special interest in the work, together with the managing director, Mr. A. S. Biggart, who took the principal direction of the operations, frequently visiting the works. The method of erection was schemed out in detail by Mr. Adam Hunter, Assoc.M.Inst.C.E., the chief engineer of the contractors, whose agent at the site was Mr. R. C. Macdonald.

Matters of Opinion.

No. 1 (continued).—The Increased Employment of Specialist Contractors.

An analysis of the letters already published on this subject, September 16th, October 14th, and October 21st, shows that the grievances of the contractors are:—

1. Contractors have no control over specialists workmen, while largely responsible for their acts and for the satisfactory character of their work.

2. Are required to provide "attendances" and "making good" for and after specialists, these amounts being not always foreseeable, and therefore cannot be properly priced when tendering.

3. Incur loss through delayed progress or completion of works, due to specialists being directly employed by building owner (through architect generally).

4. Complication of liabilities under Workmens Compensation Acts.

5. Contractor relegated to position of a mere agent, but remains responsible for acts of specialists whom he cannot adequately control.

6. Contractor often gets no profit on specialist work (owing to excessive competition).

On the other hand, architects' replies indicate that:—

a. Specialists are a necessity of the times, owing to progress of invention, providing ever fresh forms of construction or finishing, and their use should be regulated, not opposed. Contractors themselves so largely resort to subletting that they can hardly complain of the employment of specialists, and it is obvious why architects go directly to the specialist.

Specialists fall into two classes, viz.:—

Those for work which the contractor cannot himself execute, and

Those for work which some contracting firms can execute satisfactorily, while others cannot, both classes being represented among those tendering for most jobs. Consequently, provisional sums are included as a protective measure, but architects are willing to entrust firms with this latter class of work if they can show their fitness.

b. It is conceded that the increasing tendency of architects to introduce specialists often creates a situation exceedingly detrimental to the financial interests of the general builder, and that the responsibility of the contractor for specialist work ought to be strictly limited, and sometimes entirely abrogated; even to the extent of providing separate contracts for specialists.

c. Clause 20 of the form of contract issued by the R.I.B.A. in agreement with the Builders' Institute and the National Federation of Builders, sufficiently covers the complicated liabilities arising between contractors and specialists.

We think that the weight of the considerations set forth under group A, would be admitted by builders, except that they do not think it fair that the architect should go direct to the specialist for the purpose of saving the cost of the builder's commission or profit on that part of the contract, while continuing his responsibility in other respects for the specialist's work, and there is some indication in the correspondence that such is the case

The considerations set out under group B frankly admit the builder's grievance, but the cure suggested would hardly work well in practice, indeed, Clause 20 of the form of contract referred to under C, appears expressly designed to overcome the difficulties inherent in having sub-contractors about the works, who owe no consideration whatever to contractors.

When properly made use of by the contractor, Clause 20, which only becomes operative by and through the initiative of the contractor insisting upon every sub-contractor and (or) specialist entering into a sub-contract with the sole contractor, by which he accepts his share of all the sole contractor's responsibilities under the contract, is probably quite sufficient to remedy many of the grievances complained of; but this clause is not to be found in the majority of contracts.

Among the contractor's grievances which do not seem to be touched directly by any of the replies, are:—No. 1, relating to control of workmen; No. 2, provision of "attendances," etc.; No. 3, delay in completion; and No. 6, no profit on specialist work. As regards Nos. 1 and 3, Clause 20, previously referred to if carried out, gives some remedy against the specialist. As regards No. 2, architects, if approached, would probably substitute a provided sum to cover "attendances," etc., as, indeed, has been done in certain localities by friendly consultation with the local architects. As regards 6, the chief trouble arises from the differing degree of stringency with which architects and surveyors interpret the clause as to profit on provisional or specialist amounts, together with the severity of competition which causes tenderers to omit the profit item and trust to the generosity of the architect. Probably the difficulty would largely disappear if architects stated in the quantities that all provisional sums included a profit of so much per cent. to be paid by the specialist or allowed by the architect to the contractor at settlement of his account. A scale for this to be agreed upon between the Builders' Federation and the R.I.B.A., suitable to varying circumstances and sizes of contracts, instead of requiring the tenderer to add his profit as is now done. Having regard to the foregoing considerations, and especially to the frank admissions of the architect correspondents (see b), the question seems fairly narrowed down, and ought to be capable of solution by conference between the representative bodies concerned.

Federation News.

CONFERENCE OF SECRETARIES.

The Conference of Secretaries, as has already been notified in THE JOURNAL, took place at 31 and 32, Bedford Street, Strand, London, W.C., on Tuesday, October 20th, 1908, Mr. E. J. Brown (senior vice-president) in the chair.

CHAIRMAN'S ADDRESS.

Gentlemen,—I feel that I am quite the wrong man to take this place this morning. We have a President in Mr. Barnsley second to none, and I am sorry indeed that he is not here to address you, and to take part in the discussion that is to follow, because Mr. Barnsley is a man of very great tact, and he possesses that power which, unfortunately, I do not possess, the power of eloquence—and has a happy way of expressing himself. I am sure that we shall all of us feel that we have lost something by not having his services to-day. However, the honour of filling his place has been offered to me, and I accept it with the greatest possible pleasure. I must mention, to begin with, that I must be brief, because we have many interesting matters to discuss, and if I were to give what Mr. White has been pleased to call an "opening address," I am afraid I should attend more particularly to two of the points that are placed on the agenda, and I should infringe upon the rights of Mr. Moss; because if I had to preach a sermon to anyone, it would have as a text the word "organise."

It has even been our ambition here in London to organise, but there has always been one weak point in this question of organisation. One serious obstacle always crops up—*i.e.*, that there are unfortunately a large number of master builders of small, medium, or considerable standing in business, who hold themselves aloof from their local associations, thereby holding themselves aloof from the main body, which is the National Federation, and I do think that this is a matter of great regret—almost a matter of shame that there are men who take advantage of the experience, the money that has been spent, the time and trouble that has been given by the members of our London or other Associations, and yet do nothing at all to help those Associations. We feel that certain gentlemen of the building trade avoid this Society of ours. There is always the hope and belief that some of them will come in, but, so far, many firms have not come in, and they subscribe in no shape or form to our funds. This is a matter that the secretaries of the Associations might very well try to tackle. Members of the Associations feel that they have not the tact that you secretaries have in so great a measure. They go like a bull at a gate. They buttonhole the gentleman, and say, "Here, you must join the Association." He replies, "Oh, don't worry me," and nothing comes of it! I think that some of these difficulties might be overcome. We should thereby strengthen our local Associations enormously. The one thing that can be done to make a Federation such as ours successful is strenuous organising.

I take it that the secretaries and members here present are enthusiastic secretaries. I am sorry that there are not more present, but London, perhaps, is far away from some of the districts. I take it, however, that we have a very representative body of secretaries here, and that all are gentlemen who put their backs into the work, and mean to make their Associations, and with them the Federation, a power in the country and a success.

Gentlemen, there is another matter on the agenda which will take a good deal of discussion, namely, our official journal. A very great deal hangs upon this official journal. I do not know which gentleman is going to take the discussion of this in hand, but I would say that the success of the journal is a matter of the greatest importance, because the success of the journal means a great increase of power throughout the Federation.

Turning now to the question of finance, Mr. Nicholson said last year that he did not think it was fair and proper to assess men who would not make a return of their wages. I rather differ from Mr. Nicholson. Our funds in London have been built up very largely indeed by what I may call the magnanimity of our members. We have a lieu payment for those who prefer not to disclose their amount of wages' bill, and we assess them at a pretty tall figure. There is no doubt in my mind that these lieu payments have been largely the means of establishing a reserve fund for the London Association.

The work of getting in subscriptions to Associations is a matter for local secretaries to deal with. I am quite certain that this is no enviable position. A local secretary cannot insist upon a member making his return if that member refuses to do so. The secretary is in a very difficult position, and my sympathy is with him. The financial basis has been a weak point in the organisation of the Federation, and may continue to be for some time. However, I hope for better things in the future, and by means of the official journal we shall be able to show the weak spots of the organisation of the Federation, and may continue to be for local Associations, which go to make up the Federation.

With regard to the monthly reports, which we ask secretaries to send in regularly to the official organ, I hope the various Associations will make this monthly report an important thing—one

that will be of interest to everybody concerned, and that will make it absolutely necessary for every member to buy the journal. Half-a-dozen lines, at any rate, stating what has been done in your town should be possible, and I hope every secretary will at least do this, for his own sake and the sake of his Association and district.

I do not know whether it is a secret or not, but I am able to inform you that the London Association have practically arranged to take offices elsewhere, and in going to these new offices we hope to take the National Federation with us. It is of some consequence to the Federation to be in a building in conjunction with the London Master Builders' Association, Builders' Benevolent Association, and the Builders' Institute, and we have obtained very fine premises, premises which we can look upon with a certain amount of pride, where we can hold our meetings, and meet friends from the country for conferences and other purposes.

There are other matters of considerable importance which we shall discuss this afternoon. There is the question Mr. Nicholson touched upon last year. I do not know what progress has been made in regard to the use of the form of contracts with architects in the provinces. Many architects will not use the National form of contract. It is absolutely necessary that not only the members, as builders, but also that the secretaries of Associations should do all in their power to insist upon the National form of contract being used. The worst cases seem to occur in Ireland, where they have the most terrible difficulty with regard to the correct form of contract. If there is any thing the Federation can do to assist them we shall be only too glad to know of it. The great thing, however, is to see if we cannot persuade our own architects at home to adopt the proper contract form.

I feel—we all feel—that the position of the secretaries just now is a very difficult one. The pay is not what it might be, but the pay, gentlemen, cannot be improved unless you do your utmost to increase the membership in your districts, and to urge outside builders to join the Associations. I look forward with absolute certainty to the time when our Associations will be in the happy position of being able to say to their secretaries, "Your salary has been little, but we have the greatest possible pleasure in doubling it." Some day we shall reach that happy millenium, and the doubled figure will not be zero, but will require three figures to make up the total.

I thank you heartily for asking me to be your chairman to-day. I am convinced that such conferences as these are of the greatest importance to the Federation. The papers are prepared by men who know their subject, and I think that all association secretaries should make a point of attending this yearly conference, and in that way have the pleasure of meeting their colleagues from all over the country, and also the advantage of an interchange of ideas which must result in a renewed keenness and determination. It lies in the power of each secretary to make his Association a credit, a strength, and a power in and to the National Federation.

MR. WHITE

I have several letters of apology from secretaries. I will not trouble you by reading them all. They are from the following:—Messrs. James Grundy, John Tomlinson, J. McAulay, J. Wilkes, H. Williams, J. Hall, F. B. Roskell, A. Wright, and Mr. Porter, of Derby.

DISCUSSION OF PROPOSED MODEL RULES FOR A LOCAL ASSOCIATION ADJOURNED FROM 1907 CONFERENCE AND ANY RESOLUTIONS ARISING.

MR. DEAN (Oldham).

Mr. Chairman and Secretaries,—I am very gratified to find, as a result of the paper which I read at the 1906 Conference in Birmingham, that the National Council have formulated and submitted a model set of building rules for local Associations in accordance with the resolution which was passed at the 1907 Conference in London. This model set has been before the secretaries for the last twelve months, and now, subject to any alterations and conditions suggested by this Conference for the consideration of the National Federation, we ask you to approve them, and then to submit them for consideration to the National Federation. I have also to suggest that an addition be made to Rule 10, by the insertion of the following words:—

"*Members desiring to engage operatives shall not solicit such operatives to leave the employ of other members by offering better terms or otherwise.*"

This rule has been adopted by the Oldham Association under the heading "Soliciting operatives." We have a case on record where a member invited an employee of another firm to leave his employment by offering a higher rate of wages, and this was done in spite of the fact that the employee had no desire to leave. In this instance the Executive imposed a fine of one guinea. Of course, the rule is not intended to prevent a man working for another member. It is only to prevent, if possible, the soliciting of operatives who are satisfied with existing positions. It may be argued that this should be left to the good sense of the members. Where, however, there are a large number of members to deal with, it is scarcely wise to leave anything out of a model set of rules.

MR. WHITE.

Perhaps someone will move a resolution that such a rule, as indicated, be embodied.

(Mr. Dean did this.)

MR. SMITH (Sheffield).

Mr. President, I have much pleasure in seconding this resolution. It is a rule that we have embodied in our rules in Sheffield; and it is a rule that is honoured by time. The Sheffield Association rule is:—

"*Members of this Association shall not induce any other member's workmen to leave their employment, or set on men who have left their last employer in an improper manner, nor shall they employ any workman or boy out on strike or locked-out from the workshop of any member during the continuance of a strike or lock-out.*"

MR. BIGWOOD (Birmingham).

Is this rule necessary? I have been secretary of a Builders' Association for 25 years, but I do not think I ever heard of a dispute on this point raised. It seems to give such a low opinion of the members of the Association that I think it would be better left out.

MR. VOSE (Bolton).

I have had to adopt a similar rule with regard to our people. I would, however, suggest to Mr. Dean that "workmen" or "employees" should be used instead of "operatives," as men who are not members of Operative Societies do not like to be called "operatives."

MR. HOPE (Northern Counties' Federation Secretary).

What we have to keep in view is to produce a fair model set of rules. We should not alter the rules to suit the peculiarity of any Association or district. If we do, we shall destroy the character of the model, and it will become a particular set of rules rather than something that is general, and can be accepted by every Association. There are several difficulties in working the rule under discussion in some districts. A man might have a large contract, and advertise for men; that should not be such a breach of the rule. If we can endeavour to make these rules as generally useful in their application as possible, they will fit every Association.

MR. AMPHLET (Midland Centre Federation Secretary).

I support the amendment. The more we can put into these rules the better. It is much easier to eliminate than to add. We had this rule before a large number of Associations. In Birmingham we do not want the rule omitted, and other Associations find it useful. The rules are a model set—not intended to be a rigid set, but to be a pattern and example, and I think the more we can put in the greater opportunity we give of suggestions, and I support the amendment for that reason.

MR. CAMERON (Scottish Building Trades' Federation Secretary).

I have had experience of an employer falling on bad times. His employees found employment elsewhere, and when he had work again he offered them ½d. and 1d. more than standard rate to get them back. We have no rule to regulate this. If the rule is objected to in any particular district, it should be left to the different Associations to act as they wish.

MR. DEAN (Oldham).

Responding to requests, read the amended rule:—"*Members desiring to engage employees shall not solicit such employees to leave the employ of other members by offering better terms or otherwise.*"

MR. BULLEN (Liverpool).

I hesitate somewhat to venture to express an opinion on the question of forming rules when I have before me a gathering of secretaries, whom we employers consider are experts in this matter; but I know in my little experience in Association work that one of the greatest difficulties we have to deal with is getting employers in some cases to join our Association, and in other cases to try and induce some of those who are members to give up their luke-warm attitude. We legislate too much altogether. Our rules are continually being added to, and I do not think in the majority of cases with any good effect. I have not read the set of model rules, but judging by the space they take they are far larger than they should be, if we are going to send them out as model rules to every Association. We cannot attempt to legislate for every contingency which will arise. The rules will become like a family Bible, and I suggest leaving matters of this kind to the honour of our members. We must trust one another to some extent. I would suggest that Mr. Hope's advice is best, and that we do not press the matter any further.

MR. WHITE.

Mentioned that Rule X, page 11, "Unanimity among members," etc.—"*In order to preserve that unanimity so*

essential, etc.," largely met any particular cases which were not covered by specific rules.

MR. BIGWOOD (Birmingham).

These rules to be adopted must suit the needs of every Association.

MR. R. SMITH (Sheffield)

drew attention to Rule VII., par. 3:—"*Ordinary members shall have the option of having the amount of their subscription assessed at — guineas per annum in lieu of making the aforesaid return.*" This is in direct contradiction to Mr. Nicholson's remarks at the Conference last year. At Sheffield we are not willing to allow a man to have the option of having such assessment made. Returns can be treated as private and confidential, and they should not be known even to the president and treasurer. I have the greatest objection to anybody but the professional auditor and secretary seeing the returns. I move that this clause be deleted.

THE CHAIRMAN (MR. E. J. BROWN).

My experience is that Mr. Smith's suggestions with regard to the treatment of returns would be, practically speaking, impossible. The secretary of an Association is a builder in many cases, and he would see these returns.

MR. DAVIDSON (Yorkshire Federation Secretary)

drew attention to Rule VII., par 4:—"*These returns shall include all wages paid to foremen and workmen, also all wages paid to sub-contractors (except those nominated by architects), who contract for labour only, within the radius covered by these rules, and shall also include all wages paid to workmen sent from this district to work outside the radius covered by these rules. Wages paid to clerks not to be included.*" By some local people a large proportion of work is done outside the radius covered by their own Association. They do not become members of the Association within whose radius the work is performed, and so their Association does not get full returns of the wages for the work they do. There should be a rule that a member should pay for this amount of work into the funds of the Association he is actually a member of. We ought to dispose of these rules so far as this Conference is concerned. I have given careful thought to the whole of the rules submitted, and think the classification is excellent. We have to thank Mr. White, as well as the Council, for the trouble and attention they must have involved in drafting these rules. Rule VII., though, is causing considerable misgivings.

After some further remarks by Messrs. Hope, Smith, and the Chairman,

MR. MOSS

proposed an amendment that the model rules should be referred to a Committee of Secretaries, consisting of National and County Federation secretaries, for consideration, and then recommended to the Administrative Committee. This was carried.

THE CHAIRMAN

then put the amendment as a substantive motion: "That this matter be referred to the secretary of the National Federation, together with the secretaries of the Centres and Federations for consideration and then recommended to the Administrative Committee."

Resolution carried.

THE OFFICIAL JOURNAL. WHAT IS THE BEST METHOD OF OBTAINING GENERAL SUPPORT FOR IT?

Suggested by the Committee of Lancashire, Cheshire and North Wales Federation.

MR. HALL (Bury)

introduced this question, and after a short discussion, a resolution was proposed by Mr. Moss (Liverpool), and seconded by Mr. Richards (Newport, Mon.), which seemed so adequately to meet all the difficulties, and while conserving to Federation subscribers the most favourable terms as to price and delivery, provided suitable remuneration to secretaries for their services in obtaining subscriptions, that it was unanimously agreed to, and recommended to the Journal Committee for confirmation. The full particulars to be communicated by circular to secretaries as soon as possible. The members present expressed their intention to do their utmost to support the Journal in every way.

Mr. BULLEN,

Mr. Chairman and Gentlemen: I have come up to London specially on this matter, at my own invitation, because, from events that have taken place in my Federation of Lancashire and Cheshire, I did not anticipate such a happy ending to the discussion as that we have arrived at. I have thought much about it, and I am very pleased that the result is what it is. Speaking from the employers' point of view, and as one who has taken deep interest in Federation matters for some time, I have looked for years for the time when we should have a Journal which we could call our own. We all know that the Journal Committee which was appointed has worked very hard. It is the third journal we have had negotiations with, and I hope it will be most successful. I feel, so far as employers are concerned, we have great cause to be thankful, and we have one duty to perform, and that is to support the Journal and the arrangements which have been made by the Journal Committee. I was surprised at one of our Administrative Committee meetings at Manchester of the Lancs. and Ches. Federation to be told by one or two secretaries that they did not intend to do anything to help on the Journal. This was also a blow to Mr. Smethurst, who was sitting by my side (I happened to be in the chair), and I could not help feeling that, as president of that meeting, if the matter had come to that position that we were going to be told by our secretaries that they were not going to help on this matter and that they would go against it—well, if that was the position I would create another. If any Association or Federation I am connected with is going to take that position we will have either new presidents or secretaries. I have heard several objections already given both by secretaries and members of the Associations against the Journal, and not one of them worth anything. One of our leading members in Liverpool says the greatest fault with the Journal is that the Federation news is printed in small type, and he will not subscribe. I felt inclined to hit the man. Mr. Hall has heard that some members in the trade do not feel inclined to spend time in reading technical matter. Then I say the sooner they get out of the building trade the better. With regard to the subscription, there is no necessity for the fuss made about it. It is a personal matter. I have taken the paper for some time from a local newsagent. I have had it sent to me every Wednesday, but as soon as I heard of the arrangement that had been made to represent us officially, I said I was sorry I could not take the paper any longer through the newsagent, but that I should take it through our local secretary, although it was costing me more money. If it had been £2 something I might have considered the cost, but for a matter of 2s. 2d. it was ridiculous. Mr. Moss made the remark that the secretaries should accept the terms offered by Mr. Hastings. Well, they have done so. I want to give this warning. It is not true, I know, at least I hope not with the secretaries in this room, but I feel that many secretaries, speaking of the country at large, are beginning to look at matters of this kind too much in their own interests and not in the interests of the Association, and while I think the better they are paid the better secretaries we shall get—and we want better ones—the point I want to mention is that this scheme is one belonging to the Builders' Association and to the National Federation, and not to the secretaries, and it has got to go! As secretaries you have already given your word that you will make it go. The secretaries who have not considered it wise to come here to-day will also have to help, or there will be some more plain talking on the matter. You secretaries should allow me to move a vote of thanks for you to Mr. Hastings for the way he has met you in this matter with a view to overcoming this difficulty.

MR. HASTINGS, the Managing-Director of THE BUILDERS' JOURNAL, spoke, thanking the secretaries for the way they had received his suggestion, and for their promise of loyal support to the Journal.

On resuming in the afternoon, a number of papers were read, two being by Mr. A. G. White, the National Federation Secretary. These we propose to give in these columns during the next few weeks, including in this issue one only by Mr. White on "Federation Benefits." The National Secretary's papers were the last on the agenda, and this one is given a little out of its right order:—

Federation Benefits.

To the National Conference of Secretaries in 1907 I presented a paper entitled "Association Benefits," which was subsequently issued in pamphlet form for the use of secretaries when canvassing for members.

On that occasion a suggestion was made by the Secretary of the Midland Centre (Mr. Amphlet) that it would be useful and helpful to have a paper submitted this year, setting forth the benefits accruing to local associations by becoming affiliated to the National Federation through a county federation. In pursuance of a promise I then gave the following is submitted:—

Since the Federation is essentially a union of local associations, and the greater includes the less, so a Federation, provided it is efficiently conducted, can confer all the benefits which a local association can confer (see paper, "Association Benefits"), but on a larger and more influential scale.

In addition, a Federation is capable of conferring certain further benefits which could not generally be secured by a local association. If, however, a federation is to do this it must be efficiently conducted, and, as I have already shown in regard to local associations, certain things are necessary (see paragraphs 1 to 10 in paper on "Association Benefits"), and they

need not be here repeated, beyond saying that they are as necessary to a federation as they are to a local association.

The additional benefits referred to may be stated as follows:—

The prestige due to increased size enables a federation to negotiate on equal terms with other federations or national associations, whether of workmen, architects, or public bodies, not to mention its larger influence on individuals or firms. A local association has not this advantage. A federation permits such important matters as maximum rates of pay in given areas, to be dealt with on general principles and kept under reasonable control. Prevents sectional attacks by local branches of employees, and makes a national scheme of conciliation possible. Enables a contract agreement of national applicability to be negotiated and its use extended and maintained, exercises a wholesome restraint on the fads of individuals, whether architects or clients, and enables unreasonable persons to be brought to a sense of their limitations. Enables pressure to be applied to public bodies in restraint of their tendency to start and maintain works departments. Local association can do this, but to a much more limited extent. Enables ministers or government departments to be approached and influenced to afford reasonable opportunities for the builders' side to be heard and appreciated when legislation affecting the interests of the building trade is before Parliament, or when additional trade regulations are about to be introduced.

Where collective bargains are in question, the larger body of the federation can generally offer larger business and obtain better terms than can be done by a local association, while the existence of the National Federation makes possible a very large and advantageous scheme of insurance if the membership desire to improve their position in this respect.

Encroachments, whether by trades unions or others, can be resisted more successfully and at less cost by a federation than by a local association, while the control which a federation exercises over each local association in regard to granting advances of wages, makes for greater uniformity in the average wage level, and prevents hasty and ill-considered variations in wages or rules, and generally prevents or controls abuses of any kind.

Where it becomes necessary (as has been the case on numerous occasions), to grant financial assistance to individuals or to local associations who are contesting a principle, it need hardly be said that the federation reserve fund enables such assistance to be given at a less cost to individuals than would be the case if the whole burden had to be borne by any local association.

Generally a federation can act with a much greater prestige and effect than can a local association, and in any case the local association feels strengthened and encouraged in its own actions if it feels that it has behind it the opinion, power, and influence of the larger body.

One of the most powerful factors in influencing the action of individuals, public bodies, and even Parliament itself, is a clearly expressed public opinion.

The expressed opinion of the members of any great industry on any matters affecting that industry must have an important influence in forming or modifying public opinion.

There is no more effective way of giving expression to the opinion of the building trade than by resolutions passed at local meetings, confirmed at county federation or centre meetings, and approved and adopted at national meetings, and subsequently placed before the public in the columns of our federation journal; also the excellent system adopted by our journal, by which monthly reports from every part of the federation are encouraged affords every facility for the rapid dissemination of all kinds of information likely to be useful to the membership. Federation, and federation alone, has rendered this possible, and placed at the disposal of the building trade an effective method of making its voice heard.

As to future possibilities, these are obviously with the federation; the continual increase of facilities for rapid intercourse in this country is making our island a very small place so far as regards time and distance, this in its turn extends the area over which each local employer can, may, or must extend his operations, and the more he so extends the less his own local association is able to help him, and the more he has to look to the County or National Federation for any assistance or influence he may need.

As regards legislation, too, the future is full of presage of Socialistic reforms which are likely to bear hardly on industries of every kind, and will demand the most unceasing vigilance if disaster is to be avoided. It is to the extent and strength of combination that employers will have to trust to defend the interests of this great industry, and in the Federation with its democratic and representative constitution and its power of expansion will be found the best weapon if only the grit to use it be forthcoming.

These seem to be the chief benefits which affiliation to a federation confers on a local association and its membership, and they are well worth its cost.

A. G. WHITE.

MR. SMITH (Sheffield).

I have to thank Mr. White very much for the paper which he has given us, and it is a very good addition to the paper he gave last year. I notice he gives the point her about the Federation being better able to deal with matters which crop up than the local bodies. That is perfectly true, and it should be held out, of course, as an inducement to increasing membership, with the fact that the member who is the member of a local association becomes also a member of the Central Federation and National Federation. To carry the argument a little farther, I think too that we ought also to be members of the International Federation. Our National Federation goes so far as to mould into a homogeneous whole, but we ought to go further afield and join the associations on the Continent. I am pleased to see that Mr. White is going to Paris to the International Conference there. That International Conference gets a fair amount of prestige by their Congress, also the direct representation of the various Government and Board of Trade officials. This official connection, I consider valuable, as we should not then be so much like people who are crying out in the wilderness. The Government officials would be directly in touch with the builders' associations.

MR. AMPHLET (Midland Centre).

I am partly responsible for the production of this paper, and it will not be altogether out of place if I second the vote of thanks. I found, as secretary of the Midland Centre, three or four years ago, there were a number of associations in the Midlands who were not affiliated to this Federation, and the reasons that one might use to persuade such associations to join the Federation have been well set before us by Mr. White in this paper. He has exactly answered the question that I put, and I am sure that the paper will be of great service to us in bringing the associations I have referred to into line.

Market Reports.

We have received the following letter from a well-known firm of contractors:—

"We cannot say we find the prices current of builders' materials published in THE BUILDERS' JOURNAL of any use. Prices and materials vary so very greatly according to the point to which they are delivered, that even if your prices were accurate for delivery to any one spot, they would be quite misleading for other places. The prices, moreover, as far as we have checked them, do not seem to be very useful. Take the item of 5s. 6d. for Thames ballast. A casual enquiry by telephone on Saturday gave us a price 4s. 4d., delivery in cart in London. We certainly should not, ourselves, and we cannot think that any other contractor would, rely on any price in such a list for tendering purposes. If an exact price is wanted, it is a very simple thing to write to a maker for a price. If an approximate price is wanted, the telephone enables one to get such a price in five minutes from any merchant. Moreover, we do not think that any merchant would give you the real price of materials for the purpose of such a list, because the fluctuations in ordinary material, such as Thames ballast and cement are very considerable, and each order stands on its own merits, and is governed by the status of the firm ordering, the quality of the material which the merchant supplies, and most important of all, the point to which it is delivered. Speaking for ourselves, we never refer to the prices current in THE BUILDERS' JOURNAL, or any other paper."

We publish this communication because it is typical of many that we have received during the last two years; and it shows that it is almost impossible to give accurate rates for all parts of the United Kingdom. Moreover, materials now change hands so often, as the result of special quotations, and deals are so frequently effected quietly and without reference to current market rates, that the latter are apt to be more misleading than useful. A brickmaker will quote specially low terms to clear his yard; three or four cement firms will give prices for a certain quantity required for some job; and one of them will generally accept a lower offer from the contractor; timber merchants or brokers will quote realisation prices for partially mortgaged stock, and so on. Special quotations rule so largely now that we contemplate dropping the feature of market reports in THE BUILDERS' JOURNAL. We have much other useful information for which we want space, and if market prices are not useful, then the sooner they are abandoned the better. At the same time, we desire our readers to have a say in the matter. If the majority find the prices useful, we will certainly continue to give them. We hope therefore to receive opinions on the subject during the next few weeks.

Current Market Rates of Materials in the Various Trades.

The quotations given in this list apply only to larger quantities purchased in London (the minimum quantity for which these prices are applicable being given where practicable). Retail purchasers must expect to pay a reasonable advance on wholesale rates, as well as carriage. The trade discounts for each item have not been considered, as these would be affected by the quantity of the goods purchased. The endeavour is made to give fair average prices, which would in many cases be affected by the quality of the materials required.

BRICKLAYER.		Current rates.	Rates similar materials on Oct. 1.
The current rates for stocks, Flettons, and other common building bricks, and for local facings are not given, as local considerations obviously affect their prices, and readers who may make use of the information given in these columns can readily obtain quotations for themselves.

Works in Progress.

Alnwick.—The new infirmary at Alnwick, which was opened by the Duke of Northumberland on Wednesday last, is expected to cost, including lands, roads, building, and fees, but not the furniture and apparatus, about £6,000. The designs were selected in an open competition, for which Mr. Frank Caws, F.R.I.B.A., acted as assessor. The successful architects were Mr. J. Wrightman Douglas, of Alnwick and Newcastle, and Messrs. Boyd and Groves, of Newcastle. The builders were Messrs. Elliott Bros., of Chathill.

Bridgnorth.—The Committee of the South Shropshire Infirmary, finding some time ago that the accommodation had become insufficient for the needs, instructed Mr. Edward C. Maidman, architect, Edinburgh, to prepare plans for the enlargement of the building; and they have just decided to proceed with the work, accepting the tender of Mr. Thomas Lay, builder, Bridgnorth.

Burslem.—Extensive new pottery works have just been completed in Scotia Road, for Messrs. Grindley and Co., under the supervision of Messrs. A. R. Wood and Son, architects, Tunstall and Burslem; the whole of the constructional steelwork and fire-resisting floors being carried out by Messrs. Homan and Rodgers, Manchester.

Cardiff.—New bank premises are to be built at Roath, for the National Provincial Bank of England, Ltd. Mr. W. H. D. Caple, F.R.I.B.A., Cardiff, is the architect.

Florence (Italy).—The central railway station here is to be enlarged at a cost of £880,000. The new works will provide for the erection of a central building, with large waiting-rooms, offices, etc., and of two lateral buildings, the one on the right for the arrival of passenger trains and the other on the left for the mails, luggage and other special services. The permanent way between the two lateral buildings will be furnished with departure platforms and six railway tracks.

Fulham.—For the rebuilding of Stanley Bridge, Fulham, which is situated on one of the main traffic routes of south-west London, the tender of Messrs. Dick, Kerr and Co., Ltd. (£10,048 19s. 6d.), has been recommended for acceptance, three lower tenders having been passed over.

Gourock.—The members of the Ashton M.F. Church have received copies of a report by Mr. John J. Burnet, architect, Glasgow, on the plans for a new church, prepared by Messrs. Stewart, Tough and Alexander. The present fabric has been condemned as the roof and walls are both defective. The congregation will worship in the Church Halls till the new church has been erected. It is estimated to cost £3,800.

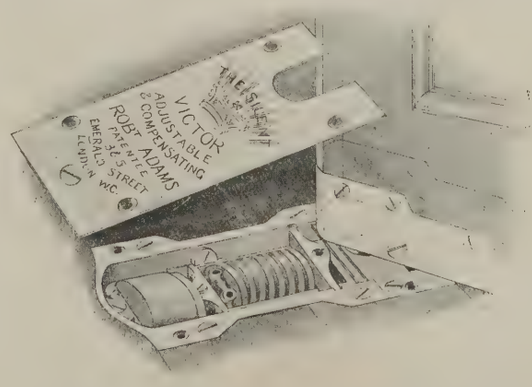
Hereford.—"Venn Wood," near here, which was completely gutted by fire last year, has been rebuilt, from the designs of Messrs. Groome and Bettington, architects, of Hereford. Whilst the new structure has been re-modelled more or less on the old lines, the opportunity has been taken to effect many improvements in the plan and equipment. The contractors for the whole of the works were Messrs. Bowers and Co., of Hereford.

London, N.—A new fire station at Holloway, N., which has just been formally opened for service, has been built by the London County Council Works Committee. The architect's estimate was £9,895. The main elevations are faced with red brick, with a salt-glazed brick dado; the elevation to Hertslet Road having stone dressings.

London, W.—A new central block for the Royal National Orthopædic Hospital is being erected in Great Portland Street, at a cost of more than £35,000.

Mansfield.—The church of St. Lawrence, of which the foundation stone was recently laid by the Duchess of Portland, has been designed by Mr. L. A. Westwick, F.R.I.B.A. The builders are Messrs. T. and R. Moore, and the contract price is £3,025. Only the nave, chancel, and transepts, giving accommodation for 326 persons, are to be built at first; but aisles are to be added when funds are forthcoming.

Oldham.—The new Palace and Hippodrome, erected for the George Dance Syndicate, will be opened next week. Seating accommodation is provided for 1,800 people.



Smethwick.—New Technical Schools are being erected in Crocketts' Lane at a cost of £14,535. Mr. F. J. Gill is the architect.

Wrexham.—A theatre is to be built on a site in Regent Street, adjoining the Imperial Hotel, and the work of preparing the site for the erection of the theatre has been commenced. The contractors are Messrs. Farringdon and Co., of Blackpool, and the architect is Mr. Thomas Price, of Liverpool. The cost of the new building, exclusive of the site, is estimated at £12,000 or £13,000. The theatre is expected to be completed by the spring of next year.

Wythall, Warwick.—The tower that has been added to Wythall Church is finished with the gable roof and timber fleche of which so many examples are seen in the villages of the North and North-east of France. The tower is 25 feet square, and is 115 feet high. Mr. W. H. Bidlake, of Birmingham, is the architect, and Mr. Harvey Gibbs, of King's Heath, the builder. The church, which was built about forty years ago, was designed by Mr. F. Preedy.

Secretary:
A. G. WHITE, 31 and 32, Bedford Street, Strand, London, W.C.

POINTS FROM THE FEDERATION AND CENTRE REPORTS.

Two important conferences are noted in the National report. At the National Conference of Secretaries, held in London, several papers of practical interest were read and discussed, and various methods of turning to best advantage the Federation's connection with THE BUILDERS' JOURNAL were suggested. At the Yorkshire conference it was shown that the inter-trading rule had been very effectual in improving organisation and increasing membership. Other items in the National report refer to the consideration of the agreement with the National Association of Master Plasterers, to the Federation's interest in the constitution of the Court of Arbitration, and to the forthcoming International Congress of Builders and Contractors at Paris, of which a summarised programme is given.

The Administrative Committee of the Lancashire, Cheshire, and North Wales Federation have decided to give notice to the local associations of a new rule providing for arbitration as between sole and sub-contractors for the settlement of business disputes. It was also agreed to recommend the local associations to hold their monthly meetings on simultaneous or approximate dates, to facilitate reporting to the Administrative Committee.

Yorkshire Federation have circulated 5,000 copies of the paper on "Municipal Works Departments" that appeared in our issue of October 28th. With respect to the Census of Production returns, a letter was read from the Administrative Committee to the effect that, in supplying the returns, totals would be sufficient to satisfy the requirements of the Local Government Board. It was resolved to ask the Federation to watch closely the course of the Building Operations and Engineering Works Bill before Parliament, with a view to checking drastic alterations at the behest of Labour members or their friends. It was resolved to communicate with the President of the Local Government Board requesting that master builders may be more equitably represented on the panels of the Court of Arbitration, and that in the constitution and deliberations of the Court due regard should be given to varying local customs and conditions.

The Northern Centre has decided to give notice of certain alterations to the Conciliation Board rules. The proposed emendations refer to disputes arising on a job of an employer outside his own town or district; to decision of voting; to the period of duration of decisions; and to private consultation at board meetings.

The Midland Centre has forwarded a circular letter to all its affiliated associations advising them to give notice for alteration of working rules, with a view to securing uniformity in all branches, and from the Birmingham report it will be seen that that association has already taken action.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

National Conference of Secretaries.

The National Conference of Secretaries was held on October 20th in London. Thirty-one attended, and, under the chairmanship of Mr. E. J. Brown, Senior Vice-President of the Federation, an interesting and instructive meeting resulted. The papers read merited and received the best attention of those present. The discussion of the best method of obtaining support for the Official Journal was of a particularly interesting and practical character, and as a result the conference unanimously approved of the suggestions made, full particulars of which will be sent shortly to every local association secretary. The papers read are appearing in the BUILDERS' JOURNAL. A fuller report will be forthwith prepared and issued to secretaries. If, as on former occasions, any desire a supplementary supply of copies, the National Secretary would be glad to have early information as to the number.

Yorkshire Conference of Secretaries.

The monthly meeting of the Yorkshire Federation Executive Council at Leeds, held on October 22nd, was followed by a Conference of Secretaries of that Federation. The National Secretary participated by invitation. There was a good attendance, and in discussion much information was elicited as to the progress and working of the inter-trading rule which has been successfully put into operation at Sheffield, York, etc. It was especially shown how usefully the larger towns could co-operate with the smaller places in carrying out the rule, and they will be earnestly asked to do so. The National Secretary noted with satisfaction the very substantial progress that has been made in the direction of improved methods of organisation in the Yorkshire Federation since he first visited the district, and that both Sheffield and York were able to show a substantial increase in membership and Association activity as a result of adopting the inter-trading rule.

N.A.O.P. Agreement.

It was arranged that on November 9th the Special Joint Sub-Committee, consisting of representatives of this Federation and of the National Association of Master Plasterers, would meet in London to consider the above agreement, in accordance with the resolution of the last general meeting.

Court of Arbitration.

Through the Employers' Parliamentary Council, steps have been taken to call the attention of the President of the Board of Trade to the desirability of having representatives from this Federation on the panels he is forming in connection with the Court of Arbitration.

International Congress of Builders and Contractors for Public Works at Paris.

This Congress, postponed from September, is now fixed to take place this month. The proceedings begin with a reception of delegates by the French Builders' Federation, on the evening of Sunday, November 15th. On Monday, 16th, opening meeting, followed by visit to the works of the Metropolitan Railway. On Tuesday, 17th, sittings of the various sections, followed by visit to the Special School for Public Works at Arcueil-Cachan, and in the evening Grande Soirée de Gala at the Marigny Theatre. On Wednesday, 18th, sittings of sections, followed by mayoral reception, and visit to the National Opera House. On Thursday, 19th, closing session, and banquet. A circular giving full information as to this congress has been sent (under date October 21st) to the federations for distribution to local associations. The National Secretary is going as representing the National Federation, and will be glad to make arrangements for a party to travel together if advised at once.—A. G. WHITE.

THE NORTHERN CENTRE OF THE NATIONAL FEDERATION

COMPOSED OF

The Lancashire, Cheshire and North Wales Federation, The Yorkshire Federation, and The Northern Counties Federation.

Secretary: JAMES DENVER, Cromwell Buildings, Blackfriars Street, Manchester.

The sub-committee appointed at the meeting of the Northern Centre held in Leeds on October 5th, to consider the proposals for alterations to the National Conciliation Board rules, met at the Boardroom, Blackfriars Street, Manchester, on Monday, October 15th, and decided on several amendments thereto to lay before the executive council on October 27th.

The executive council met in special meeting at the Grand Central Hotel, Leeds, on Tuesday, October 27th, to consider the above sub-committee's recommendations for alterations to the Conciliation Board rules, and after giving the same full consideration it was decided to delete two of the clauses, and finally resolved to give notice as follows, which notice was sent in to the parties to the scheme on October 29th:—Rule 2—Lines 20 to 24.—To add the portion underlined [italicised] to provide for dealing with employers from another town:—"If however the principal place of business of the contractor is not situate within the district covered by the Local Conciliation Board, *or should a dispute arise on a job of an Employer outside his own town or district then* it shall be competent for him to demand," etc., etc. Rule 13—Lines 105 to 107.—Decision of Voting: "But should there be cross voting the decision shall be given in favour of the side securing a majority of *at least three* of such cross votes, etc., etc." Also that the following should be made new rules of the scheme:—Period for which a Decision shall Endure: "That it shall be the duty of every Board of Conciliation when giving a decision to take into consideration the desirability of stating a minimum period for which such a decision is to endure. Private Consultation at Board Meetings: "That should either side desire to retire for private consultation during the sitting of any of the Boards after hearing the evidence, they shall be allowed to do so."—J. DENVER.

THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION

Secretary: JOHN TOMLISON, Cromwell Buildings, Blackfriars Street, Manchester.

The Administrative Committee of the Lancashire, Cheshire, and North Wales Federation met at the Boardroom, Manchester, on Friday, October 9th, when the president (Mr. William Bullen) presided over a good attendance of members. It was decided to give notice to the local associations for the adoption of a new rule at the December general meeting providing for arbitration between sole and sub-contractors for the settlement of business disputes. It was agreed to recommend the local associations to hold their monthly meetings on simultaneous or approximate dates, so as to be able to report to the monthly meeting of the administrative committee.

The chairman reported the proceedings of the Northern Centre executive with regard to the Conciliation Boards, and the appointment of Mr. J. B. Johnson, of Liverpool, to represent the centre of the National Committee to deal with the N.A.O.P. agreement.

Meetings of the joiners, stonemasons, bricklayers, plumbers, and painters' trade committees of this Federation have been held during the month with reference to relations with operatives, but no definite united action was decided upon.—JOHN TOMLISON.

LOCAL ASSOCIATIONS AFFILIATED TO THE LANCASHIRE, CHESHIRE, AND NORTH WALES FEDERATION.

ALTRINCHAM, SALE & DISTRICT ASSOCIATION.

Secretary: W. Moody.

The number of members to date is 145.

The annual meeting of the members of the Altrincham, Sale, and District Association was held at the secretary's offices on Thursday afternoon, October 29th, Mr. James Hamilton (president of the association) in the chair.

The secretary, in presenting the annual report and balance sheet, stated that seventeen new members had been admitted during the year, and that nearly the whole of the local masters were now members of the association. The total receipts for the year had been £85 18s. 4d., and the expenses (including the subscription to the Lancashire, Cheshire and North Wales Federation) £65 5s. 1d., showing a surplus in the year's working of £20 12s. 3d.

The chairman reviewed the work of the association for the past year, and congratulated the members on the healthy state of the association and finances.

Various matters were discussed, particularly the better education of apprentices by means of evening continuation and technical classes. A hearty vote of thanks to the president and committee terminated the proceedings.

BARROW-IN-FURNESS ASSOCIATION.

Secretary: J. Baker.

The monthly meeting of the Barrow-in-Furness Association was held on October 13th, when it was reported that the new rules in connection with the Operative Masons' Society had been duly signed by the association's representatives. A copy of proposed rules was submitted from the Plasterers' Labourers' Society, and the secretary was instructed to reply stating that the association had, up to the present, recognised only the rules of skilled tradesmen.

The question of the particulars asked for in connection with the Census of Production Act was referred to, and the opinion was generally expressed that in the case of many firms it would entail considerable expense, besides somewhat encroaching on the private affairs of those giving the particulars enquired for.

The subject of the BUILDERS' JOURNAL was introduced, and the members were urged to become annual subscribers.

BURY AND DISTRICT ASSOCIATION.

Secretary: Robt. Hall.

The thirteenth annual general meeting of the Bury and District Association was held at the Boar's Head Hotel, Fleet Street, Bury, on Thursday evening, October 29th. Thirty-five members were in attendance, with the retiring president (Mr. John Hutchinson) in the chair. The minutes of the last general meeting having been confirmed, the thirteenth annual report, as printed, was adopted. The following officers were then elected for the ensuing year—viz., Mr. John Inman (Messrs. J. Inman and Sons), president; Mr. W. Howard, senior vice-president; Mr. A. L. Shaw, junior vice-president; Mr. Jas. Ratcliffe, treasurer; Mr. Robert Hall, secretary; and Mr. H. W. Chell, honorary solicitor, together with two auditors and a general committee of eight.

The annual dinner of the association was fixed for Friday, December 4th, and, in accordance with precedent, it was agreed that the guests to be invited to the dinner should include the presidents of the various operative societies connected with the building trade of the town.

During the past year the committee have had to fine three members for breach of rules, two of whom, feeling dissatisfied with the committee's findings, appealed to the general meeting under the rules of the association.

The aggrieved members having stated their respective cases, it was agreed in each case to remit a small portion of the fine.

During the past month discussion has taken place with the branch trades committees with respect to the Corporation employing its own men, to the detriment of members of the association, and the new committee were instructed to consider the advisability of approaching the corporation, either by deputation or by letter.

The proposed new rules of the association, which have been under consideration for some months, were accepted subject to confirmation by the Federation.

General regret was expressed at the unsatisfactory condition of the building trade. Although several local contracts are in contemplation, none are in a position to be proceeded with at once; and an admitted shortage of cottage property does not seem to affect building.

The thirtenth annual report of the Bury and District Association shows that the number of members at the beginning of the year was 93. During the year two members have resigned, two firms have gone out of business, and ten new members have joined.

As a result of a discussion on the housing question, a committee was appointed to interview Mr. Ellis, Lord Derby's agent, with respect to certain restrictions in connection with cottage buildings. The result of this committee's labours is considered to be very satisfactory. Amongst the questions to which the committee have given time and thought are—the report of the special committee on accidents in the building trade, the conciliation rules, the Federation rules, and the proposed amendments to our own local association rules. Several meetings have been held with the operative stone masons with respect to the definition of the worked stone rule, but no settlement has been arrived at yet. Meetings have been held of all branch trade members with respect to the present rate of wages and hours of work. A small committee of the master plumbers met a small committee of the operative plumbers respecting a dispute at the workshop of one of the members, and after a full explanation the matter was amicably settled. Another small committee of the master plumbers met the chairman of the gas committee with respect to the gas committee fixing gas pipes, etc., inside cottage houses, but no report is yet to hand as to what, if anything, the gas committee have done in the matter. The financial position of the association is satisfactory.

ROBERT HALL,

Building Surveyor,

52, Frederick Street, BURY.

With over 35 years practical experience of the Building Trade, and during the last 15 years a very varied experience in measuring up and adjusting contract and other accounts, is prepared to undertake and submit quotations for the following work:—

The Measuring-up and Adjustment of Accounts,
Collection and Settlement of Accounts,
Assistance given in Estimating,
Annual or other Periodical Stocktakings,
Private Enquiries and Arbitrations undertaken,
or any other special work incidental to that a Builder or Contractor.

52, Frederick St., BURY.

J. B. JOHNSON & CO.,
FIBROUS PLASTERERS,
Crown Street, LIVERPOOL.

Contractors for the Thomson Scenic Railway, Franco-British Exhibition, Shepherd's Bush, the first and most successful side show on the field.

D. LORDEN,
Plasterer,
Plaster and Cement Merchant
Worker in Fibrous Plaster &c,
Tom Brown Street, RUGBY

Firms entitled to the benefits of the Intertrading Clauses with Associations are especially invited to send announcements for these columns.

DARWEN ASSOCIATION.
Secretary: H. C. Jephson.

In connection with the Darwen Association there is very little to report, beyond the fact that trade in this district is still in a very depressed condition. The operative joiners are in rather a better way than most local industries, however, for they receive, as from November 2nd, an increase in wages from 9d. per hour to 9½d. They have also obtained an alteration of rules, the principal item of which is that they are to receive double pay for work done on all recognised holidays.

LIVERPOOL ASSOCIATION.
Secretary: Bertram B. Moss, F.C.R.A.

Several meetings of the Liverpool Association have been occupied with the question of giving notice to the operative bricklayers' societies of a desire to put their working hours on the same basis as those of the joiners and masons, and at a general meeting recently held, it was decided to give the necessary notice.

The plumbers' committee of the association have held a meeting to consider many matters relating to encroachment on plumbers' work, and also with regard to getting the water regulations altered. With regard to the latter question, a small deputation has been appointed to discuss the matter with the city water engineer.

LLANDUDNO AND DISTRICT ASSOCIATION.
Secretary: E. P. Morris, Accountant.

In connection with the proposed Llandudno Carnegie Free Library, at a recent meeting of the Llandudno District Council, a resolution was passed to ask the builders whether they would tender for the work without quantities. A special meeting was held, when it was unanimously decided not to accept the council's suggestion.

MANCHESTER & SALFORD DISTRICT ASSOCTN.
Secretary: John Tomlison.

The re-organisation of the association in the Manchester and Salford district, referred to in a previous report, takes effect from November 1st, and members who have previously been affiliated through a branch trade association en bloc will now have to become individual members, failing which they will cease to be members of the general association. It has been reported that the concretors have now agreed to disband their separate organisation in favour of the general association.

Several meetings in connection with the association have been held during the month, the most important matters under discussion being the question of giving notice for alterations to the operative joiners' and stonemasons' working rules, with the result that six months' notice has been sent to the operatives in each trade. The amendments proposed to the joiners' rules provide for slight modification in the present winter working hours, alteration in the overtime and walking-time rules, and the arranging of a circular boundary of two miles from Albert Square.

The chief points involved in the masons' notice are a reduction in wages of a halfpenny per hour, and alterations in the present working hours—reverting to the summer hours in force previous to the decision given by the local Conciliation Board about six months ago. The branch are also endeavouring to obtain the two miles circular boundary, and a revision of the walking time rule.

Both branches have given notice that the district within which the rules shall apply shall be five miles from Albert Square, except where this overlaps any other organised district, when it shall be a matter for mutual arrangement.

Manchester Conciliation Board.

A meeting of the Manchester Local Conciliation Board was held at the employers' boardroom, Manchester, on Thursday, October 29th, to hear two appeals—one from the operative joiners, with respect to overtime and grinding money, and the other by the operative stonemasons, against an Atherton firm of builders, for bringing worked stone into the Manchester district from a lower-paid district, contrary to the rule. The two appeals were discussed at considerable length, but no decision being arrived at, they will go before the Northern Centre Board, according to rule.

OLDHAM AND DISTRICT ASSOCIATION.
Secretaries: Cowper and Dean.

The number of members to date is 180.

Since last report, the state of the building trade in this district remains about the same. A deputation from this association has appeared before the Oldham Corporation Finance Committee, and given its views against the adoption of a "new fair (?) contracts clause" submitted by the local operatives' Trades Council. The article on this subject issued in the BUILDERS JOURNAL recently, was handed in to the town clerk, and was referred to as expressing generally the sentiments of the deputation, and the clauses were dealt with *seriatim* by Councillor Samuel Smethurst, J.P., Councillor James Ogden, J.P., and Mr. William Rose, who spoke on behalf of the deputation. Councillor Samuel Smethurst said that the Master Builders' Association protested against the fair contracts clause in no antagonistic spirit. They agreed with certain portions of the clauses, but objected to a great deal which was in the other clauses. The "fair contracts clause," ought not to go further than the contractor and the corporation who let the contract. The corporation ought to do their best to see to a contractor whom they engaged to do certain work employing the best class of labour at the standard rate of wages to do that work. They, as master builders, thought the Trades Council had gone too far. He questioned their right to act as a sort of vigilance committee. He believed that the builders of Oldham, and even of all Lancashire, would refuse to tender under such conditions as those proposed by the Oldham Trades Council. Master Builders would like, in the first clause, the words "declared by the organisations of workmen to be the rate recognised" omitted. Those words were unnecessary. As for the standard rate of wages, all master builders in Oldham, as far as he knew, paid them. The second, third, and eighth clauses they accepted, but they objected entirely to the fourth, fifth, sixth, and seventh clauses. They objected to some of the petty interferences in small matters which might arise. He questioned the right of the Trades Council as an outside body to suggest and come in between the corporation and the contractor. It was not fair that the corporation should accept the opinion of an outside body to whom they had no allegiance.—Councillor Ogden said that the Trades Council wanted contractors to do certain things to which the contractors had objected. Between the Trades Council and the Corporation, if the fair contracts clause was adopted, the contractor would be in a vice. They paid the standard rate of wages, and did all they could for the workmen. It cost far more now to do the work than it did formerly. At one time, for instance, it cost £12 to do certain work, whereas at the present time it would cost £24 to do the same work.—The chairman: Which branch of the trade do you refer to?—Councillor Ogden: Bricksetting.—Alderman Horrobin: That suggests you pay bigger wages and get less work from them?—Councillor Ogden: That is so.—The Chairman: That will cause the rents to go up?—Councillor Ogden: Yes, it makes the rents dearer.—The Chairman: And poor people will have to suffer?—Councillor Ogden: Yes, that is so.—Proceeding Councillor Ogden remarked that the Trades Council, before they did anything else, should set their own house in order. They should see to their own workmen fulfilling and carrying out their duties as workmen. There was no desire on the part of the contractors to be unfair in any way, but they did not agree that workmen should go into their offices. They did not agree with the clause that a list of wages paid to the workmen on a certain job should be put up. He thought it was enough if they paid the standard rate of wages.—Mr. Rose remarked that master builders of Oldham had during the past eight years paid one halfpenny per hour more in certain branches of the trade than the majority of other contractors in other towns. As members of the Master Builders' Association, they objected entirely to the Trades Council having anything at all to do with the letting of Corporation contracts.—The Chairman inquired what the position would be if an advance of wages was conceded during the progress of a contract. He thought it would be advantageous if a clause could be framed so that if an advance of wages was agreed upon during the completion of a contract that advance should not touch the present contract in any way or on either side.—Mr. Caffrey, the Trades Council representative, was asked certain questions by the chairman, and replied by naming certain towns, etc., where the "fair contracts clause' was in operation either entirely or in part, as suggested by the Oldham Trades Council.—The deputation and Mr. Caffrey then withdrew.—The committee then briefly discussed the matter, several being of the opinion that it would have been far better if the Trades Council and the Master Builders' Association had amicably settled the matter without bringing it before them. However, they agreed, in response to a request, to allow the Trades Council to send representatives before the committee to put their views before the members of the committee on the matter, and the discussion closed.

The strike in the cotton spinning trade in this district has had, of course, a most unfortunate bearing on the condition of the building industry.

PRESTON ASSOCIATION.
Secretary: John Tomlison.

There is nothing of importance to report from the Preston Association, except that the employers have given notice to the operative joiners for a reduction in wages of 1d. per hour—from 9½d. to 8½d., to come into force on May 1st next.

ROCHDALE AND DISTRICT ASSOCIATION.
Secretary: H. Oldham.

There is nothing to report from the Rochdale and District Association except that the position with respect to the joiners' dispute remains unchanged at the time of writing.

ROSSENDALE AND DISTRICT ASSOCIATION.
Secretary: R. Hall.

A meeting of the committee of the Rossendale and District Association was held at the Queen's Arms Hotel, Rossendale, on Wednesday evening, October 14th, Mr. Jas. Tomlinson, of Haslingden, president, in the chair. Several matters were under discussion, including a question with regard to the Rawtenstall Corporation having asked for tenders for work for which quantities were not supplied, which was against the rules of the association. The meeting was adjourned to Wednesday, November 4th, when it was hoped the date of the annual meeting and dinner would be decided upon.

WARRINGTON AND DISTRICT ASSOCIATION.
Secretary: Bertram B. Moss.

The Warrington Association has had under consideration the advisability of altering the bricklayers' rules, and at their last meeting decided to send a notice of reduction in wages of ½d., and slight alteration to the rules. This notice has been sent, and a counter-notice has been received.

WIGAN AND DISTRICT ASSOCIATION.
Secretary: R. Hollows.

No notices for alterations of present working rules have been forwarded to the operatives' societies by the Wigan Association, but notice has been received from the operative joiners' society demanding a rise in the rate of wages of one penny per hour; that the working hours shall be reduced 5 hours per week in the summer months, and 2½ hours per week in the winter months; that the rate of pay for overtime shall be greatly increased, and that all workmen shall be at the pay table on Saturday at 12 noon, instead of at the "boundary." The master joiners arranged a meeting for the 10th inst., at which a stringent counter-notice will probably be drawn up.

The annual meeting of this association is to be held at the Clarence Hotel, Wallgate, Wigan, on the 19th inst.

The president elect of this Association is Mr. William Webster (Messrs. Webster and Winstanley).

There is nothing to report from Ashton-under-Lyne, Birkenhead, and Wirrall, Blackpool, Bolton and Farnworth, Burnley and District, Chester and District, Crewe and District, Heywood, Lancaster and District, Leigh and District, Longridge and District, Macclesfield and District, Middleton and District, Radcliffe and District, Southport and District, St. Helens, Stockport, Wallasey.

THE YORKSHIRE FEDERATION

Secretary; J. DAVIDSON, 14, Park Row, Leeds.

The monthly meeting of the executive council of the Yorkshire Federation was held at the Grand Central Hotel, Leeds, on Thursday, October 22nd, 1908. The president, Mr. J. Biggin, was in the chair, and was supported by Mr. A. G. White, the National secretary, and forty-eight delegates from the affiliated associations.

A paper on "Municipal Works Departments" was read by the secretary, and submitted by the emergency committee for the consideration of the Federation. On the motion of Councillor G. Mansfield, J.P., seconded by Mr. A. W. Sinclair, it was resolved to insert the statement in as many papers as possible, in order that the electors might not be misled with respect to this subject in connection with the forthcoming elections. It was further resolved, on the motion of Mr. W. R. Thompson, seconded by Councillor G. Mansfield, to print 5,000 copies for distribution among the local associations, and send copies to the other Federation secretaries as required. (The paper appeared in the BUILDERS' JOURNAL of October 28th.)

It was reported that M. Hertogs, late Burgomaster of Antwerp, had passed away since the visit of the Sheffield Association and Yorkshire Federation in August. On the motion of the president, seconded by Mr. W. R. Thompson, it was decided to request Sir Cecil Hertslet, H.M. Consul at Antwerp, to convey the sincere sympathy and condolence of the Federation with the family of the late M. Hertogs, who honoured the members visiting Antwerp by a civic welcome, and whose warm fraternal greeting and generous hospitality were appreciated

The treasurer reported receipts amounting to £26 12s. 6d. It was reported that the Finance Committee recommended payment of the final contribution to the National Federation, and on the motion of Mr. J. D. Cook, seconded by Mr. S. Coop, the recommendation was approved.

The president reported that the Northern Centre were considering the expediency of making the Conciliation Boards optional instead of compulsory, and asked whether the Federation desired to give their representatives any directions on the matter. The feeling of members was expressed in the following motion of Mr. W. R. Thompson, seconded by Mr. P. Rhodes, which was carried unanimously: "That this Federation is strongly of opinion that it would be inimical to the best interests of employers not to alter fundamental principles of the conciliation rules until more experience of the working under normal conditions is available."

A letter from the Northern Centre was read recommending associations when dealing with notices to or from the operatives for any alterations in working rules to endeavour to get a clause inserted in the rules of each trade, so "that at least a fortnight shall be allowed to consider the same and to send in a counter-notice," if such notice or notices should be received on the last day.

It was reported that the Leeds and Yorkshire Architectural Society were in full sympathy with the circular letter of the Federation with respect to the adoption of the National Contract Form, and that a deputation of the Federation had made an appointment with the West Riding Archi-

tect and engineer to discuss the various matters with him personally.

A letter was read stating that the Administrative Committee were of opinion that the basis of contribution to the National Reserve Fund should be considered by the Northern Centre, and if desired brought up at the annual meeting of the National Federation

A discussion took place as to the enormous amount of work which the Census of Production returns would entail if the information asked for was to be accurate and reliable. A letter was read from the Administrative Committee stating that totals only should be given, it being understood that this would satisfy the requirements of the Board of Trade, and this course was recommended to the members of the Federation.

A letter from the Administrative Committee, together with the observations of Mr. Wm. Shepherd on the Building Operations and Engineering Works Bill, were read and considered. On the motion of Mr. P. Rhodes, seconded by Mr. W. H. Holroyd, the National secretary was requested kindly to approach the Employers' Parliamentary Council to ensure that the Bill as submitted to the House of Commons would be carefully watched, with a view to preventing drastic amendments being made at the request or the instigation of the operatives or Labour Party.

It was reported that the Employers' Parliamentary Council were endeavouring to obtain the appointment of a certain number of nominees of the National Federation on the panels on the Court of Arbitration recently framed by the Board of Trade. The first list of members, however, does not include a building trade employer, although two building trade operatives are included. The Federation were strongly of opinion that both the National and County Federations should have trade representatives on the panels of the Court of Arbitration, and that due regard should be given to the varying trade customs of the country and the convenience of the members, and, on the motion of Mr. P. Rhodes, seconded by Mr. W. E. Biscomb, it was resolved to write to the President of the Board of Trade and also to the National secretary.

A letter was read from Mr. Tomlison stating that the National Federation were considering the advisability of establishing a Society for Builders' Foremen, and that it would be of great assistance if the National secretary could be supplied with the reports of previous negotiations on this matter, which are the property of the Lancashire and Yorkshire Federations jointly. On the motion of Councillor Mansfield, J.P., seconded by Alderman Jessop, J.P., the Federation cordially assented to the National secretary being furnished with all necessary documents and available information.

The secretary reported that at the annual Conference of Secretaries, held on October 20th, the proposed model rules for local associations were referred to a committee. With respect to the official journal, arrangements were made, subject to the approval of the Administrative Committee, whereby the subscription rate is reduced from 10s. 10d. to 8s. 6d., which is 1s. cheaper than the rate at which copies can be obtained through newsagents. Members who have paid 10s. 10d. will be credited with the difference. Members were urged to obtain the BUILDERS' JOURNAL in order to peruse the detailed report of the proceedings, which they will find of great interest and instruction. Several secretaries having expressed the opinion at the conference that the next one should be held at a more convenient centre, the Federation, on the motion of Alderman W. H. Jessop, J.P., seconded by Mr. W. Irwin, decided to give a cordial invitation to the Administrative Committee to arrange for the next annual Conference of Secretaries to be held at Leeds. A letter was read from the editor of the BUILDERS' JOURNAL inviting the attention of members of the Federation to the interesting correspondence appearing in the journal under the title of "Matters of Opinion," and requesting information to be sent on any points of importance. The invitation of the Barnsley Association to hold the next meeting in that town was confirmed, and fixed for Thursday, November 19th. Mr. Quibell invited the Federation to hold the December meeting in Hull, which invitation was cordially accepted.

The president of the Leeds Association entertained the delegates to tea, and a hearty vote of thanks was tendered to him for his hospitality.

Conference of Yorkshire Secretaries.

After tea, Mr. Biggin presided at a conference at which many local secretaries and representatives were present. Various suggestions were made for extending the membership and increasing the influence of local associations by Messrs. T. Smith (Sheffield), J. E. Sykes (Huddersfield), A. E. Dalzell (Halifax), H. Fallas (Horbury), E. Quibell (Hull), T. Lindley (Barnsley), and A. G. White, national secretary. The suggestions included, inter alia:—1, Practical utility and value of the inter-trading rule; 2, That merchants and manufacturers may be divided into two classes—(a) full members of local Association where place of business is situated, which would carry with it right to use crest; (b) Associate members for trading purposes in other districts; 3, Periodical issue of a local calendar; 4, Prompt action in matters affecting trade or individual members; 5, Value of good methods of organisation, and how these affect finances; 6, That wages returns may be obtained by the employment of right methods; 7, Appointment of separate trade committees, including builders' merchants, as soon as the number of members can make this possible; 8, Purchase of contract forms and crests through the Federation secretary, to enable statistical information to be available as to adoption; 9, that every member should be a subscriber to the BUILDERS' JOURNAL. The members present made the following recommendation to the Federation:—1, The revision of Federation rules should be proceeded with, and on account of associate members be definitely determined in order to secure uniformity.—J. DAVIDSON.

LOCAL ASSOCIATIONS AFFILIATED TO THE YORKSHIRE FEDERATION.

BARNSLEY ASSOCIATION.
Secretary: F. Denton.

The number of members to date is 50.

The monthly meeting of Barnsley Association was held on October 14th, Councillor G. Haigh, the president, occupying the chair. Eighteen members attended. The main business of the meeting was the reception of a deputation (consisting of three labour members of Barnsley Town Council) from the local Trades and Labour Council, who attended the meeting with the curious object of requesting this association of employers to promote a "local branch" of the "Builders' Labourers' Union." After the members of the deputation had stated their case, Councillor W. J. England, J.P., and Messrs. T. Lindley and W. Dunk, on behalf of the Federation, in replying, sought to impress upon the deputation that the relations between the employers and labourers were amicable, that the standard rate of wages was invariably paid, and in that respect Barnsley compared well with any town or city in the United Kingdom, allowing the highest rate of wages paid in Yorkshire. In answer to an allegation that non-union men were given preference over union men, a strenuous denial was given. The deputation thanked the members present for their very courteous reception. A special committee meeting was held on Monday, October 26th, to support the candidature of the president of the Barnsley Federation, Councillor G. Haigh, who was seeking re-election on the local Town Council. A resolution was unanimously passed thanking Councillor G. Haigh for his past services, and each member individually promised his best support to secure Councillor G. Haigh's re-election.

BRADFORD ASSOCIATION.
Secretary: J. Davidson.

The monthly meeting of the Bradford Association was held on October 27th, Mr. T. E. Taylor, president, in the chair. The question of negotiations for preferential terms with the Bradford Brickmakers' Association was held over for a month or two, by request. The members decided that a suitable letter should be sent to the "Yorkshire Daily Observer," correcting certain misrepresentations in a recent issue, in respect to the monthly meeting of the Yorkshire Federation and its resolution as to works departments. The association have recently lost two influential members through the deaths of Messrs. M. O'Flynn and P. Drake.

The Corporation at a recent meeting decided to apply for powers for extension of municipal trading, but three Socialists have since lost the seats they were called on to defend, and gains were not obtained in cases where they attacked. It is hoped that the clauses may be revised and drastically amended before the Bill is formally lodged.

DEWSBURY ASSOCIATION.
Secretary: E. B. Warmsley.

The number of members to date is 36.

The general meeting of Dewsbury Association was held on Wednesday, October 21st, Mr. Coop, president, in the chair. Eleven members were present. The report of the Yorkshire Federation meeting for September was discussed. It was decided to hold the annual meeting on November 18th, and the annual dinner on November 26th.

LEEDS ASSOCIATION.
Secretary: J. Davidson.

The monthly meeting of the Leeds Association was held on October 13th. The president, Mr. W. Irwin, occupied the chair. It was decided to send a circular letter to each candidate for municipal honours asking for definite replies as to whether they were in favour of and would vote for the abolition of the Corporation Works Department. A letter was read from the Leeds and Yorkshire Architectural Society to the effect that the council would use their influence to obtain the use and recognition by their members of the National Form of Contract. They would also recommend members to fall in with the suggestion to include an item in quantities to cover the cost of Workmen's Compensation Insurance. Officers for the ensuing year were nominated for submission to the annual meeting.

The general committee met on October 27th, and considered the replies from candidates as to their attitude in regard to the Works Department. The committee were gratified to find that the replies were much more favourable to private traders than the ones received from candidates a year ago. Two candidates had not sent replies, and it was only necessary to call the attention of the members to one case in which the reply was considered unsatisfactory.

The results of the elections on November 2nd showed a complete victory for the candidates opposed to the Corporation Works Department and against extension of municipal trading generally. Six Socialist members retired, and only one was successful in being returned.

OUR LIBRARY.

For the convenience of our Subscribers we have brought together in our offices at Caxton House, Westminster, a collection of the most up-to-date books on the various branches of Building Construction. To keep pace with the times it is imperative to have the latest editions for reference. Such editions will be found in our library, and we feel sure the advantage of thus being able to refer to them without charge will be greatly appreciated, especially by provincial subscribers visiting London, who are also invited to use "The Builders' Journal" Library for appointments which they may wish to make when in town.

SHEFFIELD ASSOCIATION.
Secretary: T. Smith.

The monthly meeting was held at the Builders' Exchange, on Thursday, October 8th. The chair was occupied by the president (Mr. Thos. Eshelby).

A further letter was read from the secretary of the Architects' Society, in reference to the vexed question of the adoption of the National Form of Contract. The architects pointed out that the main objection to the contract was that while it provided for the bankruptcy of the client, it made no provision for such a contingency on the part of the contractor. With respect to the prompt issue of certificates, the architects held that the delay was chiefly caused by the delay of the builders in tendering a full statement of account.

The question of the insertion of an item in quantities to cover workmen's compensation insurance was again discussed. The architects said that they had obtained legal advice on the point, which showed that the risk was exclusively the contractor's. Discussing the point, Mr. Biggin pointed out that where a mason gave a tender, and obtained a contract for the whole work, and sublet certain portions, it was awkward to ask a sub-contractor to produce his receipt for workmen's insurance before the tender was accepted. The matter to be a great grievance. The town clerks took an exactly opposite view to the lawyers, and pointed out that if the builder failed, the proprietors were liable for the insurance, and, at least so far as corporation contracts were concerned, it was thought that it was only fair and reasonable that an item should be inserted in the quantities which the corporations could retain and deal with in cases of necessity. Mr. Sivil thought that perhaps the best course would be for the Federation to approach the architects and agree with them on some eminent counsel, who would give a definite decision on the matter. Mr. Biggin said it was absolutely imperative that they should get the matter settled in the near future.

With reference to a circular letter from the Yorkshire Federation, calling attention to the continued fall in the contributions of the federated associations, it was pointed out that the letter would have been more effective if, instead of giving the aggregate totals of each year, it had given the contributions of each association. So far as Sheffield was concerned, it contributed £54 last year, and this year had paid already £50; while a further £7 was in hand ready to send. Sheffield was perhaps the only association in the Federation which had its wages based in the main on the actual pay-rolls of the members, and its subscriptions to the Federation were increasing. If a detailed statement of each association were given, special attention would be directed to those associations which were in arrear, and investigation could then be made as to the cause.

In the absence of the treasurer, his report was read by the secretary. The report showed the continued improvement of the association's financial condition. Despite the state of trade, the subscriptions and levies already collected for the current year were £57 7s. 10d. more than for the whole of 1906, and £20 15s. 10d. more than for the whole of last year. The secretary was instructed to deposit with the association's bankers the mortgage deed for £200 Sheffield Corporation stock, in which the association had invested a portion of its surplus funds. Accounts amounting to £21 16s. 5d. were passed for payment.

It was mentioned that, in view of the reception which had been given to the Sheffield and Yorkshire builders on the occasion of their recent visit to Belgium, it was, apart from the advantages which might accrue, an act of courtesy that some members of the Sheffield Association should attend the International Triennial Conference at Paris, which, in consequence of labour disputes in Paris, had been postponed to November. The secretary said that at least two other members of the Yorkshire Federation were willing to go—Councillor Dawson, of Huddersfield, and Mr. W. R. Thompson, of Dewsbury—and it was thought that probably Mr. Biggin and Mr. Forsdike would join them. One of the main advantages was that if English builders were officially represented at the Conference, it would no doubt be possible to induce a representative of the Board of Trade to attend in the same way as the Governments of the other countries at the Conference would be represented, and this constituted an important lever in influencing or preventing subsequent Parliamentary legislation. The matter was subsequently left over for further discussion.

As the association had been unable to obtain a direct representative to contest a seat at the forthcoming elections, a vigilance committee, consisting of the following gentlemen, was appointed: The president, and Messrs. W. Longden, C. Boot, J. A. Watson, J. D. Cook, and W. Hughes.

A letter was read from the Architects' Society, stating that they had no objection to the institution of a uniform holiday week for the building trades, and the matter was therefore left for further discussion with the operatives.

The attitude of the Amalgamated Society of Joiners in bringing an alleged breach of rules in regard to walking time to the notice of the corporation before submitting the matter to the Conciliation Board, was considered. The contractor concerned explained that in making an arrangement with the men to pay tramway fares both ways for a portion of the distance, it was not pointed out by the men or their society that the arrangement constituted a breach of the rules, and as a matter of fact, despite the provisions of the rules of the Conciliation Board, and also the rules of the Joiners' Society, not a word had been written or spoken to them about the matter until they received a letter from the hospitals committee of the corporation, asking them to attend a meeting, the upshot of which was that the corporation, under the provisions of the Fair Contracts Clause, had fined them £24, although the wages in dispute for all the men concerned amounted to less than 30s. The matter led to a long and animated discussion, the purport of which was that in taking the action as outlined above, the Joiners' Society had taken a high-handed course, which could not be justified on any grounds. The right of operatives to bring an infraction of the Fair Contracts Clause to the notice of the Corporation on any corporation contract on which a contractor might be engaged was not disputed, but it was held that that was no justification for treating the Conciliation Board with contempt; and even if the Conciliation Board did not exist, the ordinary working rules of the joiners provided that any matter in dispute should first be discussed by the employers and representatives of the workmen concerned.

The matter was most serious, and the secretary was instructed to write to the society concerned, asking for an explanation, and pointing out that so far as the employers' section of the Conciliation Board was concerned, it must either be the Conciliation Board, or it must cease to exist. After these preliminaries, it was unanimously decided that a special meeting of the Conciliation Board must be held to consider the whole facts of the case.

SHIPLEY AND DISTRICT ASSOCIATION.
Secretary: J. Davidson.

There has been very little work or trouble in the Shipley district, and this has had a bad effect on the attendance of members. A special appeal however, has been made for attendance at the annual meeting to be held in two or three weeks' time.

YORK ASSOCIATION.
Secretary: J. Hague.

Schedule of Prices.—The old schedule is being revised and brought thoroughly up to date. Special trade committees have been elected to undertake the work of redrafting, and the draft schedule will be brought before the next quarterly general meeting for discussion, alteration, or approval.

The following committees have met up to time of going to press:—Masons, Bricklayers, Joiners, Plasterers, and Slaters

York By-Laws and Traction Traffic.—An enquiry was held at the Guildhall, York, on Thursday, October 22nd, before a Local Government Board Inspector (Mr. Ponsonby Moore Crosthwaite, M.Inst.C.E.), relative to the proposed changes in the existing by-laws. The enquiry was of great interest and importance to the York Master Builders' and Contractors' Association, which had in June, 1907, made representations to the local authorities on the matter, and had, in addition, sent a deputation on July 23rd in that year, which had been successful in obtaining the removal of some of the imposed restrictions. At the enquiry, the town clerk of York (Mr. H. Craven) placed the case before the inspector on behalf of the Corporation, and Mr. J. R. Macdonald (London) appeared in opposition to the proposals, primarily on behalf of the National Traction Engine Owners' and Users' Association. The town clerk, in opening the case, referred to the by-laws, which had been framed under the Locomotive Act, 1898, and by which certain streets were totally closed to traction traffic, and others partially so. Under the new proposals, several additional streets would become totally closed, owing to their narrow thoroughfares and the consequent greatly congested state of the traffic. The nature of the subsoil also was unsuitable to traction traffic, which caused vibration and consequent damage and injury to property. It was, however, proposed to afford greater facilities for obtaining special permits. Complaints and memorials had been received from residents and traders in various parts of the city with reference to the nuisance caused by the vibration. Several witnesses were examined and cross-examined on the case for the corporation. Mr. Macdonald, in opening his case, said that the backbone of the city was the Great North Road, which it was now proposed to close at both points where it entered the city, making engines divert their way. He suggested that the Corporation should take into consideration certain classes—the Kent and Birmingham, and the steam roller exemption clauses, which allowed exemption from restriction (1) for purpose of access in carrying material for highway repair, (2) for locomotives wishing to traverse not more than 200yds. of a prohibited road in crossing it during any journey, (3) for municipal and county steam rollers. On the town clerk's enquiring whether the first clause would do away with the restriction as to time, and receiving an affirmative answer, he said he could not see his way to accept it, as it would kill the by-laws and make them of no effect. Special permits, which he would endeavour to see were within reason, made more easily obtainable, might meet such a case. The inspector agreed that the clause would make the by-laws nugatory. With reference to Ouse Bridge, which it was proposed to close between 9 a.m. and 1 p.m. and 2 p.m. and 5 p.m., Mr. Macdonald said the association wanted the bridge open at all times. Mr. L. Wray, brick manufacturer (a member of the York Master Builders' and Contractors' Association) said that his firm's works were on the Huntington Road. Most of their business was, on account of the restrictions, done on that side of the river. If the restrictions were removed, they could extend their business done on the other side of the river. A day's work was often lost owing to inability to get to the bridge before 9 a.m., as in the winter it was dark up to 7 or 7.30 a.m., which did not allow them time to get loaded up and travel the 1½ hour's journey from their works to the bridge. The average number of journeys would not exceed twenty per annum. Mr. Geo. Sharp (president of the York Master Builders' and Contractors' Association) spoke of the effect on trade of the present by-laws. In these days of high prices and pressure it was necessary to economise as far as possible. In their competition with outside traders, they could save fifty per cent. by using engine haulage instead of horses and carts. To all intents and purposes, the proposed new by-laws, if adopted, would double the cost of haulage. The new circuitous route which was proposed would, he thought, meet the case, provided that Ouse Bridge was thrown open all day. Messrs. Shaftoe's manager (members of the association) said the extra hour allowed them in which the bridge could be crossed would be a help. Mr. Rouse, Selby, said the proposed restrictions would greatly hinder the getting into York of his engines, which was a frequent necessity for him to do. After the hearing of other evidence, the enquiry closed, the inspector expressing his wish to see the streets concerned in the through route.

There is nothing to report from Barnoldswick and District, Bridlington, Grimsby, Halifax, Harrogate, Huddersfield, Hull, Malton, Morley Scarborough, Sheffield, Wakefield.

THE NORTHERN COUNTIES FEDERATION.

Secretary: W. H. HOPE, Solicitor, Post Office Chambers, 14, Norfolk Street, Sunderland.

HARTLEPOOLS ASSOCIATION.
Secretary: E. Moody.

At the monthly meeting of the Hartlepools Association, held on Monday, October 26th, Mr. W. M. Thompson (president) occupied the chair, and there was a fair attendance of members. Minutes of previous meeting having been read, were confirmed. The minutes of the Northern Centre meeting and National Conciliation Board meetings were also laid before the members.

The chairman reported upon the difficulty between the Northern Federation and the Durham County Council, respecting the conditions of contract, and the members were requested to do their utmost to influence the members of the County Council to procure the adoption of the Quantity Guaranteeing and Arbitration Clauses.

Complaints having been laid by many sub-contractors as to the state of affairs at present existing between proprietors, head contractors, and sub-contractors, a small special committee was appointed, including representatives of each branch of the trade, to consider the matter fully, and to report to a further meeting of the association. The committee would be glad to hear from the officials of any affiliated association of any special conditions existing in any district or Federation and to receive copies of any contract forms, specially prepared for the use of contractors with their sub-contractors. [See under Bristol.—Ed. "B. J."]

The special committee have since met, and it is proposed to have a conference with the architects and engineers in order to consider the subject from every point of view.

Nominations for officers, committee, representatives to federations, etc., were then made, and the members will vote upon the nominations received at the next meeting (the annual one), which was fixed for November 30th.

NEWCASTLE AND TYNE DISTRICT ASSOC.
Secretary: Wilton A. Rycroft, Accountant.

With the exception of the death of Mr. Edward Weatherley, one of our oldest and most respected members, there is nothing special to report with respect to this association.

The new rules mentioned in my last report have been approved of by a general meeting of the members and are now in the printer's hands.

Trade still remains very dull.

SOUTH SHIELDS ASSOCIATION.
Secretary: J. G. Robertson.

As a result of the adoption of the telephone card, and the putting into operation of the inter-trading rule, increased applications for membership are being received by the South Shields branch. As far as can be foreseen, everything points to this adding very many new members to the association.

The reports, etc., are being got ready for the annual meeting, which it is hoped to hold on Thursday, November 12th.

There is nothing to report from Blyth, Middlesbrough, North Shields, Stockton-on-Tees, Sunderland, Teesside and District.

THE MIDLAND CENTRE OF THE NATIONAL FEDERATION.

Secretary: F. W. AMPHLET, 58, New Street, Birmingham.

A quarterly meeting of the Executive Council of the Midland Centre was held at the Acorn Hotel, Birmingham, on Thursday, October 15th last. Mr. Wm. Wistance (president) took the chair, and there were 15 others present. The secretary was instructed to send a letter of sympathy to Mr. Mark Round (president of Dudley M.B.A.), in his continued ill-health.

The report of the emergency committee, in reference to the proposed Midland Centre rules, was considered, and a letter from the National secretary, suggesting various alterations, was read. The draft rules, with slight alterations, were approved, and recommended to the annual meeting for adoption. In the meantime, the emergency committee were requested to consider Mr. White's suggestions more fully, and (if thought advisable) embody them in the rules.

The secretary's quarterly report stated that the only difficulty with the operatives had occurred at Leicester. The question in dispute (walking boundaries, and definition of district) had been referred to the Mayor of Leicester as arbitrator. The secretary had been instructed by the emergency committee to obtain the names and addresses of all mayors, town clerks, borough surveyors, chairmen of spending committees, and other officials in the district, in order that Mr. White might communicate with them in reference to the use of the contract form.

Great reluctance had been manifested again this year in filling up the annual return of wages asked for by the National Federation.

During the quarter, the secretary had met the members of the King's Norton and Bromsgrove Associations. In spite of repeated applications, the subscriptions had been coming in very slowly.

The report and financial statement were approved, and the secretary was instructed to write an urgent letter to those associations whose subscriptions were still unpaid.

Mr. W. Yates gave a report in reference to the dispute at Leicester. A statement of claim had been sent to the Mayor by both parties. The operatives' statement, however, contained a condition as to the settlement of the dispute which the Mayor had declined to accept, and the matter was therefore at a dead-lock. The Council advised the Leicester M.B.A. to refer the matter in dispute to the Local Conciliation Board, and further recommended that the signed rules with the operatives at Leicester be so altered that all disputes must be referred to the Local Conciliation Board.

The secretary was instructed to attend the conference of secretaries in London, on October 20th last.

The council approved of the admission of the builders' labourers to the conciliation scheme, on the conditions set forth in the report of the sub-committee of the National Conciliation Board.

The secretary read a letter from the King's Norton M.B.A., with reference to the boundary of that association. They wished to adopt a boundary which would include part of the area covered by the Birmingham Association. The members of the Birmingham Association in the district claimed had expressed a wish to remain in the Birmingham Association, and the latter association did not see its way to give up the district referred to. The request had been made largely with a view to facilitate dealings with the operatives, and to prepare the way for the formation of a Local Conciliation Board. No resolution was taken, but it was generally agreed that there was nothing to prevent the King's Norton Association forming a Local Conciliation Board.

The secretary was instructed to send a circular letter to all the local associations in the centre, advising them to give notice of alteration of working rules, with a view to securing uniformity in all branches of the trade.—F. W. AMPHLET.

LOCAL ASSOCIATIONS AFFILIATED TO THE MIDLAND CENTRE.

BIRMINGHAM ASSOCIATION.
Secretary: E. J. Bigwood, J.P.

The committee of the Birmingham Association have discussed at considerable length the advisability of serving notices on the operatives for alteration of the working rules; with the object of obtaining the long-wished-for uniformity of working hours, it has been ultimately decided to serve the following notices:—"The ordinary hours of work to be altered in all trades from the present times to 6.30 a.m. to 5 p.m. in the summer, and to 8 a.m. to 4.30 p.m. in the winter; the men, during the short-time, to have had breakfast before commencing work, and to have half-an-hour for dinner. The short time to run from the second Monday in November to the second Saturday in February, inclusive. Overtime in all trades to begin after 5.30 p.m. in the shops and after 6 p.m. on the job." The committee also decided to serve a notice on the operative masons to reduce fixers' wages by ½d. per hour to the ordinary masons' rate.

A deputation has been appointed to confer with the architects, surveyors, and builders' merchants as to "prime cost" items in quantities.

The annual meeting was arranged to be held at the Grand Hotel, Birmingham, on Tuesday, November 10th; at that meeting the president of the association (Mr. F. G. Whittall) would move that the following addition be made to the rules:—

"Members shall not give or take tenders to, or from, any persons who are not members of this or kindred associations connected with the building trade, and shall not employ such persons to do work for them; the term kindred associations shall mean associations federated to the National Federation."

The following resolutions were also to be moved: "That trade members be requested, wherever possible, in dealing with merchants, or firms of a like nature, to give preference to honorary members of this associatsion."

"That a similar telephone card to the one in use in Liverpool be adopted by this Association."

After the meeting the annual dinner was to be held at the same place; the Lord Mayor elect (Mr. Councillor G. H. Kenrick, J.P.), and the President of the National Federation (Mr. C. H. Barnsley), had accepted invitations to be present.

LEICESTER ASSOCIATION.
Secretary: S. A. Dove.

The number of members to date is 116. There is nothing much to report from Leicester this month. The dispute with the operatives with respect to walking time has not yet been settled, but it is hoped that the trouble will be ended before the next issue is printed. The membership is steadily increasing, and efforts will be made shortly to get the ironfounders and painters to join this association individually, as the intertrading rule would be of great benefit to the members of those branches. I am pleased to report that the members are with a few exceptions remaining very loyal to the association and to the intertrading rule.

NOTTINGHAM ASSOCIATION.
Secretary: W. J. Barton, F.C.I.S.

The Nottingham Association have arranged with the Nottingham University College authorities for a popular lecture to be delivered under their joint auspices. The subject is "Reinforced Concrete," and Mr. William Dunn, F.R.I.B.A., of London, has been secured as the lecturer. The lecture is to be delivered in the large hall of the college, on Friday, November 20th, at 8 p.m. The lecture will be illustrated by lantern slides. The association is purchasing a large number of tickets for the use of its members and their foremen and leading hands, as it is felt that the subject is one on which workmen have yet a good deal to learn, and that they should be encouraged to take an interest in it.

The Association has also offered prizes of the value of £5 5s. to students at the Nottingham University College. A condition is that each student must be bound apprentice to a member of the association. This condition may somewhat restrict the number eligible for the prizes, but will increase the chances of those apprentices who are directly connected with the association. One reason for making this condition is that the association feel it will be to the interest of the building trades that the system of apprenticeship shall be maintained and not allowed to fall out of use, as is the tendency with some employers. The subject chosen for the coming session is "Building Construction," Stages 1, 2, and 3. First prizes of the value of one guinea will be given for Stages 1, and 2, and a guinea and a half for Stage 3, with second prizes of half a guinea for each of the three stages.

The prizes will be awarded on the result of the Board of Education examinations. This is an experiment, and if it is found to be successful other subjects, such as "Builders' Quantities," may be taken up next year. Already a number of apprentices have expressed their intention of competing for the prizes.

The above, it is submitted, are examples of how an association may be of service to its members, and to the building trades generally, and this is obviously one of the most effective ways in which an association can make its position and influence felt. The Nottingham secretary will be pleased to give any further particulars.

WALSALL ASSOCIATION.
Secretary: J. L. Sweet.

From Walsall there is nothing to report for the past month, except that trade still keeps in a depressed condition in this district.

There is nothing to report from Bromsgrove, Burton-on-Trent, Coventry, Derby, Dudley, Hinckley, Kidderminster, Leamington, Lincoln, Long Eaton, Loughborough, Mansfield, Newark, Northampton, North Staffordshire, Nuneaton, Redditch, Stafford, Stourbridge, West Bromwich, Walsall, Wolverhampton.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Nov. 12. LYMINGE.—Erection of receiving wards at the workhouse, Lyminge, for the guardians of Elham Union. Plans and specification can be seen with R. Lonergan, clerk, 11, Cheriton Place, Folkestone, to whom tenders are to be delivered before 8.30 a.m. on Nov. 22.

Nov. 12. BRIDGEND.—Alterations to Llangan Rectory, near Bridgend, for the Reverend Owen Jones, Rector. Plans can be seen, and bills of quantities obtained, at the office of the architect. Tenders are to be delivered by Nov. 12, to G. E. Halliday, F.R.I.B.A., 19, Castle Street, Cardiff.

Nov. 12. GUISELEY.—Execution of various works in the parish church extension, in accordance with plans prepared by Nicholson and Corlette, of 2, New Square, Lincoln's Inn, W.C. Applications for quantities must be made by Nov. 12, to Harold Chippindale, architect and surveyor, Guiseley, near Leeds, when quantities will be forwarded in due course. Applications must be accompanied by a deposit of one guinea.

Nov. 12. DUBLIN.—Alterations and additions to recreation hall, etc., at the Royal Hibernian Military School, Phœnix Park, for the board of public works. Tenders will be received up to 10 a.m. on Nov. 12, by H. Williams, secretary, office of public works, Dublin, where plans and specification can also be seen. Forms of tender and bills of quantities will be supplied on deposit of £1. Separate envelopes containing tender and the bill of quantities must be endorsed "Tender for Works at the Royal Hibernian Military School."

Nov. 13. OLDBURY.—Erection of new schools, Abbey Road, Warley, for the U.D.C. Builders desiring to tender are requested to send their names and addresses by Nov. 13, to Sydney Vernon, secretary, Public Buildings, Oldbury.

Nov. 13. BERRYWOOD (Northampton).—Erection of a new isolation hospital at Berrywood asylum, Northampton. Persons desirous of tendering are requested to send their names by Nov. 13, to Christopher A. Markham, clerk to the visiting committee, 1, Guildhall Road, Northampton.

Nov. 13. CROYDON.—Erection of a testing-room, for the corporation. Plans can be seen, and specification and form of tender obtained at the office of the borough engineer, town hall, Croydon, upon deposit of one guinea. Tenders to be sent endorsed "Testing Room, Waterworks, Surrey Street," by 11 a.m. on Nov. 13, to F. C. Lloyd, town clerk, town hall, Croydon.

Nov. 13. SOUTHAMPTON.—Reconstruction of roof of the headquarters, drill hall, St. Mary's Road, Southampton Territorial Force Association. Plans, specifications and conditions of contract may be seen at the offices of the engineers, Lemon and Blizard, MM.Inst.C.E., Lansdowne House, Castle Lane, Southampton, and bills of quantities obtained, on payment of two guineas. Tenders, on the forms provided, are to be delivered, endorsed "Tender for New Roof, Headquarters, Drill Hall," before 10 a.m. on Nov. 13, to R. A. G. Harrison, C.M.G., colonel, secretary, 32, Queen's Terrace, Southampton.

Nov. 14-23. LONDON (for Fermoy, Ireland).—Erection of 12 "B" married soldiers' quarters at Fermoy new barracks, county Cork, Ireland, for the War Department. Plans and specification may be inspected at the office of the director of barrack construction, Cork, on Nov. 11. Bills of quantities and form of tender may be obtained on application to the director of barrack construction, Pall Mall, London, S.W., acompanied by ten shillings. No application will be considered after Nov. 14. Tenders must be in sealed envelopes, and delivered by noon on Nov. 23, marked "Tender, Married Soldiers' Quarters, Fermoy," to H. De La Bere, director of army contracts, War office, Whitehall, London, S.W. The bills of quantities should accompany the tender in separate sealed envelope, similarly addressed, and marked "Bills of Quantities, Married Soldiers' Quarters, Fermoy," bearing the contractor's name and address.

Nov. 14. BUSHBURY, South Staffs.—Erection and completion of a new council school for about 380 children in Bushbury Lane, Bushbury, South Staffs, for the Education Committee. Persons desirous of tendering should apply by November 14, to Graham Balfour, director of education County Education Offices, Stafford. Quantities will be supplied upon deposit of £2 2s., which should accompany the application.

Nov. 14. WEST VALE.—Alterations to shops at West Vale, for the Sowerby Bridge Industrial Society, Limited. Plans and specifications may be seen and bills of quantities obtained at the offices of the architects. Sealed tenders, endorsed "Tender for Alterations to Shops," to be delivered at the offices of the society, or to Medley Hall and Son, architects and surveyors, 1, Harrison Road, Halifax, by Nov. 14. Fair wages clause.

Nov. 14. PONTYPRIDD.—Erection of a residence, with outbuildings, etc., in the Lan Wood, Pontypridd, for S. G. Hill. Plans and specifications can be seen and bills of quantities obtained at Pontypridd and Tonypandy offices, and at 12, Edward Terrace, Cardiff, on deposit of £1 1s. Tenders to be sent by Nov. 14 endorsed "Tender for Lan Wood House," to W. Morgan Lewis and T. Naunton Morgan, architects and surveyors, Pontypridd.

Nov. 14. LOWESTOFT.—Erection of a new secondary school, Lowestoft (accommodation 300), for the Education Committee. Persons desirous of tendering are requested to send in their names by November 14, to R. Beattie Nicholson, town clerk, Town Hall, Lowestoft. A bond with approved sureties for completion of the work will be required. The application is to be accompanied by a deposit of one guinea for bills of quantities.

Nov. 14. BRACEBRIDGE (near Lincoln). — Additions to the Bracebridge Girls' School, near Lincoln, for Kesteven C.C. Bills of quantities and forms of tender may be obtained at the office of the county surveyor, 53, High Street, Grantham, upon deposit of £1. Specifications and plans may be seen at the office of H. H. Dunn, Silver Street, Lincoln, or at the county surveyor's office, Grantham. Sealed tenders, endorsed "Tender for Bracebridge School," to be delivered by Nov. 14, to Hudson Donaldson, secretary, county education office, 64, London Road, Grantham.

Nov. 16. WHITELEY WOODS, SHEFFIELD.—Erection of new lodge and conveniences at Whiteley Woods, for the City Council. Plans may be seen, bills of quantities and forms of tender obtained, on application to the city architect, town hall, Sheffield. Sealed and endorsed tenders (enclosed in envelope provided) to be delivered by Nov. 16, to R. M. Prescott, town clerk, town hall, Sheffield. Fair wages clause.

Nov. 16. YEADON.—Erection of a cookery room at South View Provided School, Yeadon, for the West Riding education committee. Plans may be seen and bills of quantities obtained on application to the architect. A deposit of £1 is required posted to the West Riding treasurer, county hall, Wakefield. Applications to the West Riding architect, for the quantities. Sealed tenders, properly endorsed, to be forwarded by 10.30 a.m. on Nov. 16, to J. Vickers-Edwards, county architect, county hall, Wakefield.

Nov. 17. HULL.—Alteration and additions to Craven Street school, for the education committee of the corporation. Drawings and specifications may be seen, and quantities obtained (upon deposit of two guineas), of Joseph H. Hirst, city architect, town hall, Hull. Remittances to be made payable to the city treasurer. Tenders, sealed and endorsed "Tender for Alterations and Additions, Craven Street School," to be addressed to the secretary of education, and delivered at the education offices, Hull, before 10 a.m. on Nov. 17.

Nov. 17. MANCHESTER.—Structural alterations and additions required at the depot, Hyde Road, Ardwick, Manchester, for the tramways committee. General conditions, specification, bill of quantities and form of tender may be obtained on application to J. M. M'Elroy, general manager, tramways department, 35, Piccadilly, Manchester, on deposit of £2 2s. Plans may be inspected and further information obtained at the engineer's office. Tenders to be addressed to the chairman of the tramways committee, 55, Piccadilly, Manchester, endorsed "Tender for Alterations, Hyde Road Depot," and must be received by 10 a.m. on November 17.

Nov. 17. CHELMSFORD. — Erection of a cowshed (brick and slated roof), 81 ft. by 63 ft., to accommodate eighty-four cows, and the construction of a roof over an auction-ring in the cattle market, for the Corporation. Specifications, bills of quantities, forms of tender, and full particulars may be obtained (on deposit of £2 2s.). The plan may be inspected, at the borough surveyor's office, 16, London Road. Tenders, on the form provided, in sealed envelopes, endorsed "Market," must be delivered by 4 p.m. on Nov. 17, to W. Smith, town clerk, Municipal Offices, 16, London Road, Chelmsford.

Nov. 17. PRESTON.—Erection of school buildings in Deepdale Road and St. Stephen's Road, Preston, for the corporation. Plans may be seen, and specification, bills of quantities and form of tender obtained, at the office of the borough surveyor, town hall, Preston, on payment of £2 2s., to whom sealed tenders, endorsed "Tender for Deepdale School," must be delivered by noon on Nov. 17. Fair wages clause.

Nov. 18. CYNLLWYN-DU, TYLORSTOWN. — Erection of a church at Cynllwyn-du, Tylorstown, for the Rev. John Rees. Plans and specification may be seen, and quantities obtained at the office of the architect on deposit of two guineas. Tenders to be sent, sealed and endorsed, by noon on November 18, to E. M. Bruce Vaughan, F.R.I.B.A., architect, 21, Dumfries Place, Cardiff.

Nov. 18. NANTWICH.—Additions and alterations at the police station at Nantwich, Cheshire, for the C.C. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., county architect, Chester, and quantities obtained on deposit of £1. Tenders to be delivered to Reginald Potts, clerk of the peace, Chester, by 10 a.m. on Nov. 18, endorsed "Tender for Nantwich Police Station."

Nov. 13. BARROW-IN-FURNESS.—Erection of a laundry at the workhouse at Roose, for the guardians. Plans and specification may be inspected and bills of quantities obtained on application to Henry T. Fowler, A.R.I.B.A., Cornwallis Street, Barrow. Tenders, marked "Tender for Erection of Laundry" to be delivered at the parish offices, Harrison Street, Barrow, before 6 p.m. on Nov. 18. (See also "Engineering.")

Nov. 18. DARWEN.—Erection of an elementary school to accommodate 510 children, for the corporation. Plans and details may be seen, and bills of quantities, etc., obtained on application to R. W. Smith-Saville, borough engineer and surveyor to the education committee, at the municipal offices, Darwen. Tenders, on the form provided, sealed and endorsed "Tender for School," to be delivered by noon on Nov. 18, to William P. Halliwell, town clerk, town clerk's office, Darwen.

Nov. 18. CHESTER.—Erection of two new public elementary schools for 200 and 660 children respectively, to be erected in Egerton Street and Cherry Grove, Boughton, Chester, for the Corporation. Plans and specifications can be seen at the offices of the respective architects, viz., W. T. Lockwood, F.R.I.B.A., 88, Foregate Street, and Douglas and Minshull, 6, Abbey Square, Chester, and quantities obtained on deposit of £1. Tenders are to be sent by 10 a.m. on November 18, to J. H. Dickson, town clerk, Chester, endorsed "Tender for Egerton Street school, or Boughton school, Chester," as the case may be.

Nov. 19. BROMLEY-BY-BOW.—Erection of a bathroom at the workhouse, St. Leonard's Street, Bromley-by-Bow, E., for the guardians of Stepney Union. Specifications and forms of tender, etc., can be obtained on application to the clerk, and tenders must be delivered by 4 p.m. on Nov. 19, to T. G. Stacey, clerk, guardians' offices, Barnes Street, Stepney, London, E. Plans can be inspected any day (except Thursday) between 10 a.m. and 5 p.m.

Nov. 20. CALSTOCK, Cornwall.—Erection of a United Methodist Chapel and School at Calstock. Plans and specifications may be seen in the school adjoining the old chapel, on application to T. Stone, chapelkeeper, Calstock. Sealed tenders to be sent to J. H. Reed, Tamar View, Calstock, by November 20.

Nov. 20. BELFAST.—Erection and completion of new male schools, Seaforde Street, Belfast. Plans and specification can be inspected at the offices of J. J. M'Donnell, architect, 27, Chichester Street, and bills of quantities obtained from Acheson Ferguson, Scottish Provident Buildings, on deposit of one guinea. Sealed tenders, endorsed "Seaforde Street Schools," are to be delivered to Very Rev. H. Laverty, P.P., D.D., St. Matthew's Presbytery, by 5 p.m. on Nov. 20.

Nov. 21. LEYTON.—Erection of the Sybourn Street Council schools, Leyton, for the U.D.C. Quantities, conditions, and form of tender may be obtained, on written application to William Jacques, A.R.I.B.A., of 2, Fen Court, Fenchurch Street, E.C., not later than November 21, which must be accompanied by a deposit of a £5 Bank of England note. Sealed tenders, in special endorsed envelopes supplied, must be delivered by hand at a meting of the council to be held early in December. The contractor will be required to enter into a bond with sureties for performance of the contract. Fair wages clause.

Nov. 23. MARSDEN (near Huddersfield). —Erection of a new school at Marsden, near Huddersfield, for the West Riding education committee. Plans may be seen and bills of quantities obtained on application to the architect on and after Nov. 14. A deposit of £1 is required, posted to the West Riding treasurer, county hall, Wakefield. Application to the West Riding architect for quantities. Sealed tenders, properly endorsed, to be forwarded by 10.30 a.m. on Nov. 23, to J. Vickers-Edwards, county architect, county hall, Wakefield.

Nov. 23. LUTON.—Erection of a new block of buildings for aged men, and alterations and additions to the male sick wards at the workhouse, Dunstable Road, Luton, for the guardians, according to plans, specifications, and quantities, which may be inspected at the office of Gotch and Sanders, architects, 55, George Street, Luton. Bills of quantities will be supplied on payment of one guinea. Contractors will be required to find two approved sureties. Tenders endorsed "Workhouse Alterations," to be delivered to William Austin, clerk, 7, George Street West, Luton, by 10 a.m. on Nov. 23.

Nov. 24. MANCHESTER.—Erection of women's lodging-house, Corporation Street, for the corporation. Drawings may be seen and specification and bill of quantities obtained at the office of the city architect, town hall, upon payment of two guineas. Cheques or postal orders to be made payable to the order of "The Corporation of Manchester." Sealed tenders, enclosed in the official envelope, to be delivered at the above office by 5 p.m. on Nov. 24.

No date. HARROGATE.—Erection of new business premises, Oxford Street, Harrogate, for Warwick and Co. Contractors desirous of tendering for the various trades, are requested to send their names to Bland and Bown, architects, Harrogate, and quantities will be forwarded.

No date. BIRKENHEAD.—Erection of a stable and earthworks in connection with forming a private garden at Palm Grove Nursery, Birkenhead. Bills of quantities and other information can be obtained on application to the architect, John W. Rodger, 14, High Street, Cardiff.

ENGINEERING.

Nov. 12. ELLOUGHTON AND BROUGH (York). —Construction of spring collecting works, collecting chambers, covered storage reservoir, 6,420 yds. of 5 in., 4 in., 3 in. and 2 in. cast-iron water mains, with valves, washouts, fire hydrants, consumers' services, and other works in connection therewith, at Elloughton and Brough, in the county of York, for the Elloughton and Brough Water Co., Ltd. Drawings, specification, etc., may be seen with Fairbank and Son, M.Inst.C.E., engineers to the company, Lendal Chambers, York, from 10 a.m. to 5 p.m., except Saturdays. Copies of specification, quantities and form of tender may be obtained on deposit of £3 3s. Sealed tenders, endorsed "Tenders for Elloughton and Brough Waterworks, Contract A," to be sent to E. Hind, solicitor, Goole, before 10 a.m. on Nov. 12.

Nov. 13. LLYN FAWR (Glam.).—Construction of a reservoir at Llyn Fawr Lake, in the parish of Ystradyfodwg, Glamorgan, with works in connection therewith, including a temporary tramroad connecting the works with the Great Western Railway at Hirwain, for the Rhondda U.D.C. Drawings may be inspected and copies of the specification, schedule of prices and forms of tender obtained upon application to J. E. Hughes, M.Inst. C.E., at his office at Tynewydd, Treherbert, upon a deposit of £5. An assistant engineer will accompany attending contractors to the site of the works on Oct. 27, starting from the engineer's office at Tynewydd, Treherbert, at 11 a.m. Sealed tenders, enclosed in envelopes provided, and addressed to the chairman of the council, endorsed "Tender for Reservoir," must be delivered by 10 a.m. on Nov. 13, to W. P. Nicholas, clerk, council offices, Pentre, Glam. Fair wages clause.

Nov. 14. ECCLES.—Installation of electric wiring and fittings for the lighting of buildings at the town's yard, for the Cleansing and Scavenging Committee of the Corporation, in accordance with a specification prepared by the borough electrical engineer. Copy of specification and form of tender can be obtained from the town clerk. Sealed tenders to be delivered in an official envelope by noon on Nov. 14, to Edwin Parkes, town clerk, town hall, Eccles. Fair wages clause.

Nov. 14. EDINBURGH.—Electrical installation for lighting the cattle market, Gorgie, for the Lord Provost, magistrates and council. Specification, plans and form of tender can be obtained on deposit of one guinea of Frank A. Newington, engineer, electricity supply station, Dewar Place, Edinburgh. Tenders, endorsed "Electrical Installation, Cattle Market," must be sent to the town clerk, City Chambers, Edinburgh, by Nov. 14.

Nov. 14. CASTLEMUNGRET (Limerick). — Execution of repairs to the embankment on the river Shannon, in the townland of Castlemungret, county of Limerick, for the Irish Land Commission. Copies of the specifications and plans, with form of tender, can be obtained on application to the secretary, Irish Land Commission, Dublin, on payment of one shilling. All tenders, duly filled up and signed, are to be sent to the secretary of the Irish Land Commission before Nov. 14. Contractors to be prepared to sign a bond furnishing sureties.

Nov. 17. MANCHESTER.—Supplying (a) two steel boilers, for heating purposes. (b) Hard-drawn copper trolley wire, for the corporation. Specifications and forms of tender may be obtained on application to J. M. M'Elroy, general manager, tramways department, 55, Piccadilly, Manchester. Tenders are to be addressed to the chairman of the tramways committee, 55, Piccadilly, Manchester, and must be received by 10 a.m. on Nov. 17.

Nov. 18. BARROW-IN-FURNESS.—Supplying an engine boiler and other new machinery and fixing existing machinery in connection with new laundry, for the workhouse guardians. Particulars may be obtained upon application to H. T. Fowler, A.R.I.B.A., Cornwallis Street, Barrow. Tenders endorsed "Tender for Laundry Machinery," to be delivered at the parish offices, Harrison Street, Barrow, before 6 p.m. on Nov. 18. (See also "Building.")

Nov. 20. OLDHAM.—Supply and erection of mechanical stokers for the dry-back marine and climax rollers at the generating station, Green Hill, Oldham, for the corporation. Specifications can be seen or obtained on application to S. Wilmott Newington, borough electrical engineer, Greenhill electricity works, Oldham. A charge of one guinea will be made for the specification. Sealed tenders, endorsed "Tender for Mechanical Stokers," addressed to the chairman of the electricity committee, Greenhill offices, Oldham, to be delivered by Nov. 20.

QUANTITY Surveyors.—A builder wishes to place his son (18) in above office; has had some experience. No premium, but can introduce business.—Apply H., Ashford House, Wimbledon Common. 4686

QUANTITY Surveyor, Member Q.S.A., 32, eight years' practical building experience, eight years' office practice, desires post as senior or managing assistant.—Box 4610, Builders' Journal Office.

SLATE MERCHANTS AND BUILDERS' MERchants.—Experienced traveller (with 14 years' connection Midlands), desires re-engagement; at liberty middle of December; or could arrange earlier.—Address, Slate, c/o Secretary, Builders' Exchange, Sheffield. 4624

SLATING and tiling wanted (labour only) day or piece; any quantity, large or small; distance no object.—Mack, Slater and Tiler, 3, Granville Cottages Tower Hamlets Street, Dover. 4619

SHOP or General Foreman, long West-end experience, used to alterations and repairs; understands stairs; used to good jobbing work. Address A., c/o Mr. Seymour, 14, Allsop Place, Regent's Park, N.W. 4586

STUDENT R.I.B.A., 23, well trained man, desires situation as assistant; 1½ guineas. — Box 4607, Builders' Journal Office.

STONEWORK wanted (piecework).—Stone dressings, Bath stone fronts to villas, etc.—Apply A. Powell, mason, 15, Elm Lodge Avenue, Reading. 4667

TO Builders.—Situation as improver wanted by young man just out of his time; technical student; neat draughtsman; assist with quantities, supervision, etc.; abstainer. — Box 4662, Builders' Journal Office.

TO Estate Owners.—Builder (38), varied experience, desires position as agent or clerk of works, surveys, plans, quantities, setting out, accounts and supervision; country preferred.—Box 4591, Builders' Journal Office.

Appointments Vacant.

APPLICATIONS for architectural situations written promptly in striking form, that will exhibit applicants' capabilities and experience to best advantage, by technical man. — Box 4616, Builders' Journal Office.

CAPABLE clerk required in London office, must have experience of estate work and repairs to house property; book-keeping and rent collecting.—Apply by letter only, stating age and qualifications, to A. J. H., 36, Princess Road, Regent's Park, N.W. 4665

MARBLE.—Smart salesman required, with thorough knowledge of the wholesale marble trade; good opening and permanent post for right man.—Apply Salesman, Box 4671, Builders Journal Office.

TYPIST and shorthand writer wanted, one used to builder's or architect's office; state age, experience and salary required, to Box 4697, Builders' Journal Office.

Purchasing Agents.

A Belfast firm of builders' providers, doing extensively with builders, etc., in Ireland, is open to treat with a few good houses with a view to becoming purchasing agents for them in Ireland; stocks can be kept.—Box 4700, Builders' Journal Office.

November 18, 1908. Volume 28. No. 719.

Hope's Flattering Tale.

Unemployment in the building industry, affecting all grades, from the architect to the labourer, has come so near agony point, and, to the average mind, is so inexplicable, that any authentic pronouncement on the present unhappy posture of affairs is sure to be eagerly welcomed, whether or not it encourages hope of speedy relief. It occurred to a writer in the "Westminster Gazette" that the head of the great firm of Holloway Brothers should know something both of the causes and the effects of the subject, and in the course of the resultant interview Mr. Holloway showed that this confidence had not been misplaced. Mr. Henry Holloway admits that we are in the depths of a depression such as, in thirty years' experience, he had never before seen equalled; but withal he makes, on the whole, an optimistic forecast. The causes of the depression are want of capital and consequent lack of enterprise. People (including municipalities) will not build if they can help it while money is scarce and dear. "What has been absolutely necessary has been done, but outside the absolutely necessary there have been no schemes at all." The speculative builder was paralysed by the prohibitive state of the money market. But Mr. Holloway thinks that we have touched the very bottom of the depression. Money is cheaper again, and this softening of the rates of usance must have the effect of putting in hand the many works that have been held back pending the slackening of the purse-strings. Unless, therefore, Hope, as impersonated by Mr. Holloway, "tells a flattering tale," an immediate improvement is in prospect. One remark of Mr. Holloway's will, we think, be surprising to most builders. He was inclined to deny that the seasons *per se* very greatly affect the volume of London trade. Winter, he acknowledged, bears hard on the painter and decorator, but the chief reason why there are then so many other men out of work is found in the annual influx, especially at Christmas time, of large numbers of men from the provinces. "The amount of work does not fall off, but the number of available workers increases enormously." He thinks that the idea of shortening the hours of work in order to give employment to more men is impracticable in London. Business premises have now to be run up in about a third of the former time, and the master builder has therefore to press on. Relays or shifts of men would be, more particularly in certain classes of work, very seriously inconvenient—in masonry, for instance, you could not take off one mason from the piece of stone he was cutting, and put on another man to finish it. We gather, therefore, that Birmingham's example is but little likely to be followed in London. But, if Mr. Holloway's forecast of "better times ahead" be not falsified, there will be happily no need to extend the experiment.

Another Welsh Idyll.

A week or two ago we referred to the disruption of the amenities in the Vale of Llandyssul; and now some kind friend has sent us a marked copy of the "South Wales Daily Post," wherein we find more trouble—this time in Llandilo—and again over the local surveyor. If the treatment meted out to the surveyors at Llandyssul and Llandilo is at all typical—well, the Welsh surveyors have our sincere sympathy. In the first case, the unfortunate surveyor incurred the wrath of his Council because he wanted an increase on his salary of £5 a year. At Llandilo it was proposed that the surveyor should fill up the cracks in the walls of the electric light station. This does not, on the face of it, sound very alarming; we have seen many Council instructions to surveyors reported in similar terms. But when we explain that this proposal is to be taken literally, and that the Llandilo surveyor was, in the true spirit of the Craft Guilds, to ascend the scaffold and tuck cement into the cracks with the point of the trowel, it will be seen that the story has some elements of pathos—or bathos. Our contemporary's account is very short; it but records the hard and austere facts, and there "may be more behind." Perhaps the surveyor had designed the electric light station, and the proposal was in the nature of a just retribution for the defects that subsequently developed. Some idea of a punishment fitting the crime may have lurked in the mind of the worthy councillor who made the proposal. Who knows? The Surveyor could but plead that such work was not nominated in his agreement, and fortunately, he found a friend, who "referred to the dignity of the office"—nobody seems to have thought of the dignity of the Council—and proposed that "the surveyor be kept to his duties, and not to do mason work." And on a vote—it actually came to a vote—the surveyor escaped. But what has the Bricklayers' Union to say to it all? We recommend the local secretary to keep a watchful eye on the Llandilo Council.

The Parthenon and Some Modern Architectural Critics.

We have recently perused, with much interest and pleasure, the excellent opening address delivered by Mr. Paul Ogden before the Engineering and Architecture Section of the Manchester School of Art. Replete as it is with sterling advice to the architectural student of to-day, we propose to refer to it at greater length on a future occasion. But, in view of the fact that the incongruous design of one of the façades of a lately completed metropolitan building (in which the central feature—a stone screen of Italian Renaissance character is appropriately (?) flanked by Jacobean gables)—has received the loudly expressed approval, both lay and professional, of many would-be critics, we were beginning to wonder whither the same trend of thought would land us could it be applied to some of the purest examples of the purest of all styles of art. Mr. Ogden has solved the riddle by giving us his idea of the kind of criticism to be expected if (immediately on its completion, about the middle of the fifth century B.C.) the architectural aspect of the Parthenon had been reviewed by one of the many modern architects who prefer incongruity to scholarship, and "picturesqueness" to dignity and repose, viz.:—"When are architects going to abandon the copying styles, and give us something new and original? We confess we are tired of this repetition of columnar architecture. Have we no architects whose soaring souls recognise the degradation of copying from their predecessors? It must, however, be conceded that the architects of the Parthenon have carefully corrected optical illusions. Thus the entasis, or graceful swelling of the columns, has been applied to correct an appearance of hollowness in the supports, while the outer intercolumniation has been narrowed for the purpose of making the angle of the temple appear stronger. The slight hollowing of the underside of beams over the openings serves to prevent them from appearing to sag, or drop in the middle. The steps of the stylobates are also raised in the middle to avoid any appearance of sagging at the centre. The inward tendency of the columns prevents an appearance of falling outwards, while the axes of the angle columns would meet, if sufficiently prolonged, at a height of about a mile above the ground. On these points we congratulate them." And we congratulate Mr. Ogden on his pretty knack of parody.

The Enemy at the Gate.

The vicissitudes of the ancient priory church of St. Bartholomew-the-Great, West Smithfield, have been extraordinary, and seem to be interminable. The church, by its history and antiquity easily the most interesting building in the City, has hardly emerged from the scandalous encroachments in which it was immured, when fresh troubles of similar character are threatened. Its ancient gateway is in danger of obliteration, and possibly of destruction, by the proposed erection, in close proximity, of modern business premises. As Sir Aston Webb has said, "It would be lamentable indeed if in the course of one year the City should lose Crosby Hall and the picturesque entrance to the most ancient church in the City," and, but for the ill-omened reminder of the fate of the former building, one could feel quite confident that there would be no difficulty in raising the money necessary for the preservation of this fine fragment of Early English architecture. The gateway, which comprises an acutely pointed arch, moulded in four orders, with a tooth ornament in the hollows, has been supposed by some authorities to mark the site of the original west front; but there is more reason to suppose that it was the entrance to the monastic enclosure. At any rate, it is worth rescuing from the ruin that would probably be its fate if it were inconsiderately freed from the encroachments that, by an odd irony of circumstance, now form its means of support. These encroachments, although it cannot be claimed that they are picturesque, are at all events fairly old and very familiar, and their supersession by brand-new buildings would be disastrous in effect, whether or not the arch survived them. Those of the City fathers who tried to save Crosby Hall, and failed, have now an opportunity of taking a sweet revenge. Let them speak with the enemy at the gate!

Architect as Clerk of Works.

An odd incident has arisen at Southport. A councillor objected to the appointment of a clerk of works from the surveyor's office. The objector admitted that, as architect and draughtsman, the official in question was most competent and able, but it was contended that a clerk of works ought to be a man who to a record of actual participation in manual work added special experience in supervision. Whether this contention—by the way, the councillor who advanced it was a builder—would have been sustained is problematical, for the gentleman who had been nominated for the post took the dignified course of declining to stand, and thus saved his supporters from the risk of defeat. We do not at all insist on a decree absolute that a clerk of works should invariably be drawn from the ranks of the workers. The office is ancient and honourable, and has been reputably held by many respectable architects. But it has certainly come to be regarded as the goal of the ambitious workman—nearly always a carpenter—who may be supposed to have a closer acquaintance with the little tricks that it is one of the duties of the clerk to circumvent, than has the gently nurtured, and hence unsuspecting professional man, who, as a rule, would, as a matter of status, and perhaps with a touch of chivalry, rather remain an architect's assistant at a steady thirty shillings a week than deprive some aspiring ranker of the magnificent opportunity of a periodic or intermittent three-pounds-ten. Whosoever will may call this snobbery; we prefer to regard it as a very proper feeling of professional pride. At the same time, we should by no means feel justified in regarding the architect clerk of works as an outcast and a pariah. The "gentleman ranker" often qualifies as an uncommonly excellent officer.

Sculpture in Vienna.

The extremely able and sympathetic article on Viennese sculpture contributed by Mr. Rudolf Dircks to the November number of *The Art Journal* deserves more than mere passing notice. It contains some remarkably apposite critical notes anent the many splendid examples of the sculptor's art which are to be found in that historical city, and the present writer is heartily in accord with the following general conclusions at which Mr. Dircks has arrived—viz., "Whether it be modern, that is of the last 50 years, or whether it goes back two hundred years, it remains equally a vital and living expression of the artistic spirit of its time. It is never uninteresting, it may possess many defects according to your point of view, but it is never commonplace. You can not get away from the life of it; its tricks are not those of artistic convention, or, in any narrow sense, of artistic formulae. But in the larger sphere of schooling, in anatomical knowledge, in keeping the scale of the forms in relation to the proportions which surround them, in placing, as it were, the right word in the right place you may often find adherence to a formula as old as the Greeks."

Thus, always interesting and scholarly, and ever bearing distinct traces of the traditions and teaching of the school or phase of art to which they belong, the works of the Viennese sculptors, be they ancient or modern, usually attain a high standard of excellence. As an example, mention may be made of the two modern colossal fountain groups in white marble, symbolizing "Naval and Military Power," adorning Fischer von Erlach's curved façade of the Reichskanzlei-Palast, which indeed, by the boldness and originality of their conception, and the anatomical excellence of their modelling, appear to successfully hand on the teaching and practice of the great Michael Angelo. or again—in illustration of other schools of thought—note the exquisite simplicity and restraint—the pathos and poetry—of the charmingly appropriate and graceful memorial to the ill-fated Empress Elizabeth, and the absence of conventionality and general freedom of design displayed by the great Baroque sculptor Raphael Donner, in, among many other works, his well-known fountain enriched with figures of river gods. The successful application of sculpture to buildings is nowhere better exemplified than in some of the beautiful specimens of Baroque architecture with which Vienna is so liberally supplied, and Mr. Dircks has done well to draw attention to the vigorous treatment and masterly craftsmanship usually displayed by Viennese sculptors where they have thus joined hands with the architect.

Attractively illustrated as it is by reproductions of some charming drawings from the facile pencil of Mr. E. A. Rickards, including one depicting the main entrance of the Ministry of the Interior in Wipplingerstrasse (which appeared some time back in the pages of THE BUILDERS' JOURNAL), we heartily commend to the attention of our readers this masterly sketch of old-time and contemporary art.

Mr. Lishman's Water Colours.

The exhibition of drawings in water colour, by Mr. Frank Lishman, A.R.I.B.A., which has recently been on view at the Ryder Gallery in Albemarle Street, is one of exceptional interest to architects. The collection contains many well chosen examples of Italian and English architecture, and some striking landscape drawings, many of which display a fine eye for colour and artistic effect. To particularise, we would mention, as worthy of special commendation, No. 20, The Black Water of Dee, Galloway, noticeable for some fine colouring; No. 31, Chartres (after sunset), a most effective sketch; and No. 57, a charming drawing of Harrow-on-the-Hill, and a very successful example of the artist's powers. Of the many architectural subjects to be seen in the gallery, we prefer No. 9, and early morning impression of Giotto's Campanile at Florence; No. 43, the Tower of San Frediano Lucca; No. 44, Bologna, a rich colour study; and No. 47, the Interior of the Duomo Pisa, which is one of the finest drawings in the room. Mr. Lishman is to be heartily congratulated, both upon his landscape sketches and his excellent pictorial rendering of many extremely difficult architectural subjects.

The Dwindling Timber Supply.

The prophecy of a timber famine was re-affirmed by Mr. Lewis Miller, of Crieff, in giving evidence before the Royal Commission on Coast Erosion at Westminster on November 11th. Mr. Miller, who has had forty years' experience of the timber trade in Scotland, Ireland, Norway, Sweden, Newfoundland and Canada, said that the world's timber supply was giving out. The Scandinavian and Russian forests that had supplied this country for sixty years were nearly exhausted. The United States forests would at the present rate of consumption be exhausted in from twenty to thirty years. The Canadian forests could not last longer than twenty years, and the timber on the Pacific Slope would be wanted during the next twenty or thirty years by the United States, Canada, South Africa, Australia, and Japan. Those best able to judge estimated a timber famine inside thirty years, unless steps were at once taken to prevent it. He recommended that the planting of all our waste land should be made compulsory, as in Germany.

A Word for Terra-Cotta.

A slight misunderstanding with respect to terra-cotta has received "the necessary correction." This material, it seems, is being maligned by those who say that it cannot be produced true to form. The manufacture of glazed bricks, terra-cotta, and pottery, formed the subject of an interesting lecture delivered on November 12th, on the invitation of the Sheffield Society of Architects, by Mr. W. H. Allen, of the Burmantofts Works, Leeds, and the lecturer, having described in interesting detail the processes involved, from clay pit to kiln, dealt with the objections that were formerly raised against the use of terra-cotta in building. The chief of these, one of truth in shape, had now been overcome, and work could now be turned out with great fidelity to architects' designs. Terra-cotta could be manufactured quickly and in large quantities. A further advantage was that it was unaffected by the atmosphere.

THE SENSE OF TASTE IN ART.*

By Felix Clay.

I have intentionally headed my paper "The Origin of the *Sense* of Taste," because I am anxious at the outset to make it quite clear that it is my object to isolate and consider the simple direct feeling of pleasure that we have as a kind of intuition when we see certain forms, colours, etc., or hear certain sounds.

Philosophy of Likes and Dislikes.

We all have a fund of natural instinctive likes and dislikes in colour, form, proportion, and so on. However little of an artist a man may be, he still chooses, and with care, his furniture, his wall-papers, his waistcoats, his neckties, and so on, and he evidently is affected strongly by something in the appearance of things quite apart from the utility or otherwise of the object. Everyone is actuated by likes and dislikes, which, when properly cultivated and developed, become art principles. How did this quality arise? Why should we like some things and dislike others, when they are both equally useful or equally useless? There ought to be some reason to account for our natural delight in symmetry, proportion, balance, rhythm, harmony, and our natural discomfort in their absence. If we follow up our various likes and dislikes we shall find at the bottom they rise from some necessary power of selection that helped to determine survival. We must sooner or later find in what way this curious liking for harmony, balance, symmetry, etc., could have been in its early stages of direct value to the organism in the struggle for existence.

What is Taste in Art?

It is obvious that taste in art is primarily the selection of the beautiful. Roughly speaking, by beauty we refer to something in the appearance of an object that gives us a feeling of pleasure in the simple contemplation of it. The age, historical association, memories, etc., of a building are not true æsthetic qualities, but it so often happens that the associated ideas aroused by a beautiful thing and the feelings and emotions they excite are so much stronger than the simple sense response that they almost instantly monopolise the whole attention, and thus seem to be the beauty that is felt. We are so anxious to get a meaning and ideas that we are apt to neglect the simple sensation of pleasure in the beauty, in favour of the intellectual idea. This aspect of beauty is a fascinating and delightful subject, but now we are considering the simple sensation with its feeling of pleasure apart from *canscious* recognition of its various attributes. Many of our tastes are due to this comparison and memory of numerous small points of likeness to things or persons previously experienced, but which we should be incapable of consciously recalling. This point of the subconscious recognition is one of great importance, as it makes it possible by training and practice to get what seems to be an absolutely unconscious feeling for things which have previously been consciously perceived and recognised.

Taste is Subjective.

Beauty consists in the pleasure that is given to our æsthetic sense. Certain objects, views, sounds, give rise to pleasant feelings. It is a psychological commonplace that whenever our feelings are aroused in connection with an object they are at once projected outward and considered as qualities of that object. Beauty we are apt to consider as in some way a quality of the object in which we perceive it, and yet it only exists in our perception of it. Beauty is our expression for the particular way in which we are affected; a beauty not perceived is a pleasure not felt; it has no objective existence. The sense of beauty is subjective, growing with the growth of the individual, widening and expanding with his increase of understanding and powers of perception, until what was once only a physical pleasure becomes transformed into an ideal delight.

Beauty Not Absolute, but Relative.

Is there, then, such a thing as an ideal beauty — an absolute — towards which our efforts and attempts may be considered to be tending? Beauty is due only to the particular arrangements and functions of our sense organs, evolved in and developed to suit a particular environment.

A thing is beautiful to me because I like it, and it moves me emotionally in a particular way. I do not like it because it is "beautiful," because it conforms to some abstract laws of composition to be discovered by research. Laws of composition are, after all, only the sum of what is found successful, and theory lags but slowly after practice.

Primitive Natural Origins.

Our sensations, and in a rough way, our likes and dislikes, can be traced back into the animal kingdom, becoming less and less differentiated and less keen until they finally merge in the lowest organisms in one single faculty of sensation, probably that of touch. So we shall find the prototype of all our instincts in a more rudimentary form in the animal kingdom. The elements, so to speak, are to be found in the animal kingdom, but the human brain is required in order to arrive at æsthetic feeling. Imagine a primitive organism of a rudimentary type developing into the various stages of advance under the stress of the struggle for existence. Thus we see that one of the earliest of all qualities to be developed is that of taste, the selection of suitable food, suitable position, etc.; this would be in the early stages devoid of consciousness, and not until a certain point of development was reached would consciousness appear, and with it the sensation or feeling of pleasure or of discomfort. Like and dislike are not originally determined by pleasure or the reverse, but our likes and dislikes are the present forms of originally necessary reactions formed by physico-chemical reflexes which drew the organism towards the wholesome or suitable, or away from the dangerous or unsuitable.

We have an innate sensuous pleasure in certain combinations of colour, sound, or form, in rhythm, balance, symmetry, and so on, which is previous to and independent of intellectual appreciation. These qualities must have been, at first, in the position of determining a tendency towards (like) or appetition for the suitable, favourable or necessary, and away from (dislike) the unsuitable or dangerous.

Pleasure in Recognition.

It is easy to see that at a very early stage in the development of feeling and consciousness there would be a sense of pleasure in the recognition of the familiar, and of discomfort in the unknown; for it might possibly be dangerous, and was pretty sure to be unsuitable. The pleasure in simple recognition is very great, and persists with a strength that is often apt to be overlooked. To a child, a savage, or even the ordinary person, to recognise, to be able to name, and thereby to have at least the feeling of understanding, is a great pleasure.

Balance, Action and Reaction.

The law of the universe is balance, action and reaction. An organism developing in it, and moulded by its conditions, must necessarily for itself be so formed as to correspond to this law, however concealed. It does not seem an unfair assumption to assert that the instinctive pleasure in harmony is directly sprung from the impelling need for suitability to environment, and is of the utmost advantage to the organism, as giving information whether it was in harmony with its immediate surroundings at the earliest possible moment.

The Physical and the Moral,

The desire for conformity with environment will not only impel us to make our surroundings suitable and beautiful —*i.e.*, pleasing—so that all our perceptions may as far as possible be harmonious, but the intellectual side will, as always, be developed from the physical, and will also require satisfaction, demanding a life that shall be spiritually and mentally in accord with the meaning of the universe. For perceiving a law and order in the physical world it is natural to conclude by analogy that there must also be an order and meaning in the moral world. So in art, the mind realising the felt beauty of simple objects and the power of rhythm can combine portions of the external world of colour, form, or sound, in new and novel combinations producing new and far more intense sensations of pleasure, but always guided and limited in form by the types that have been with us always, by the ever-present, felt need for harmony.

The suggestion, then, that I have to make, is that taste is the direct outcome of the need for adaptation to environment, and that this accounts for our innate liking for harmony, symmetry, balance, etc.

Cause of Decoration.

One of the many reasons which led to the production of decoration is that which has been described as expectancy. The eye feels the want of something to which it has been accustomed. In all kinds of decoration and form, there is a sense of congruity and fitness in that to which we are thoroughly accustomed; so that anything very striking or new is apt to be disliked at first sight, though we may afterwards get to find it better and like it more than the other, because it is not difficult to imagine a stage of existence at which it was vitally necessary to preserve and quickly recognise the normal and familiar.

The Pleasure Felt in Simple Curves

is of great interest, because we can at times get a feeling of pleasure which is due to the simple sense feeling that is clearly independent of any complication of ideas. If a circle, a straight line, an ellipse or a curve be presented to the eye successively, it is possible to distinguish a slightly different feeling aroused by each. A curve, such as we describe by the terms flowing or graceful, can, we

*Abstract of a paper read before the Architectural Association on November 6th.

may easily imagine, be followed by a more natural and rhythmical movement of the optic muscles than a straight line or an uneven zigzag. A circle may arouse its specific feeling by the monotonous repetition of similar movements as the eye passes from the centre to various points upon the circumference; it is not generally found attractive, nor is a straight line, unless either is in a position that demands for strength, stability, or fitting action, perfect circularity, or an accurate adjustment, only to be secured by perfectly straight surfaces. In this case they are borrowing some of their attraction from the meaning that we are consciously attaching to them. It is, however, easy to see that though form may be indebted to convenience or suitability for its attractiveness, the actual recognition of this aspect may become so unconscious that the resulting feeling arises directly from the impression as a simple sense response, of which we may, or may not, be able by reflection to trace the cause.

Utility a Determinant of Taste.

Utility ultimately has determined our likes and dislikes, for utility has inevitably settled what forms shall survive just as much in artificial as in natural conditions. The useful forms have become the familiar types upon which our idealised conceptions are based. This does not mean that a thing is beautiful because it is useful. The conscious recognition of the utility of a thing by no means enables us to see it as beautiful, but obvious utility will win tolerance for a thing, while glaring obvious unfitness will spoil anything. But for a thing to become pleasing the recognition of its utility must have long passed the stage of conscious appreciation.

The Origin of Art.

Art originated in skill devoted to making the environment more suitable, storing up in some form the accumulated experience of previous generations in improved conditions and the production of useful objects. Beauty then arose, as far as it was produced artificially, as an incident.

It is, I think, quite clear that to whatever source we may attribute the first impulses to art production, we are bound to admit that there must have been pre-existent to the first actually produced work of art an innate sense of taste, likes and dislikes to certain arrangements and forms, colours, and sounds, that made it possible to appreciate the first tentative efforts and that gave enough pleasure to induce continuance and development. It is the natural origin of this upon which I have been trying to make some suggestions.

Art's True Dignity.

One point I must refer to before concluding, and that is to deprecate the idea that there is anything disparaging to the dignity of art in thus suggesting an early physical instinct as the origin of the sense of artistic taste. When we see how all our higher feelings and emotions are based upon animal instincts that have been raised by the power of the mind of the soul into the ideal regions where the joys and pleasures are those of the imagination and intellect, until it is hard indeed to recognise their lowly origin; when we see religious spirit passing from the animism and fetichism of the savage, the rude anthropomorphism of the early races into the self-sacrificing beauty of the Christian ideal or the disinterested self-annihilation of the Buddhist, we need feel nothing derogatory to art in proposing a similar growth and development.

Discussion.

Mr. David Murray proposed a vote of thanks to Mr. Felix Clay, for his excellent paper, which dealt with a subject that had been greatly neglected.

Mr. Simpson, in seconding, desired to compliment the Council upon its courage in admitting such a paper. In subject and treatment, it was a distinct departure from the essays to which they were accustomed. He held that such a paper was unquestionably of practical value to men who were being trained in a scientific art such as architecture. The speaker firmly believed that pain and pleasure formed the mainsprings of art.

Mr. Felix Clay having briefly replied, the meeting ended.

REGISTRATION: THE CASE RESTATED.*

By Geo. E. Bond, J.P.

In his presidential address to the Society of Architects, on November 12th, Mr. Geo. E. Bond, J.P., dealt chiefly with the registration of architects, a subject that may be said to constitute the main *raison d'être* of the Society. After reviewing briefly the past year's work of the Society, and congratulating the members on its steady growth, constantly expanding scope, and ever-widening circle of influence, Mr. Bond referred feelingly to the death of his predecessor in the office of president, Mr. Frank Vallance, and then proceeded to consider

The Bill for the Registration of Architects.

With regard to the great measure with which the name of this Society will ever be associated, said Mr. Bond, viz., the Registration Bill, very little progress has been made. Mr. Atherley Jones, K.C., M.P., who has charge of the Bill in the House of Commons, was again unsuccessful in the ballot, therefore there was no opportunity of introducing the measure. But in the meantime your Council has, by meeting the objections raised by the Association of Municipal and County Engineers, secured their co-operation, without in any way sacrificing the principle of the Bill. Also it has succeeded in removing some objections raised by the Institution of Civil Engineers of Ireland. Thus distinct steps in our advance towards ultimate success have been taken, as every unit of opposition turned to support and co-operation adds materially to our strength, and such progress has been made in this direction, that we may, I think, congratulate ourselves, and also those architects throughout the United Kingdom who have avowed themselves to be in thorough agreement with the principle of the Bill, upon the fact that the forces of opposition have been broken up.

The registration movement was initiated in response to the persistent demand of a large number of provincial practitioners that something should be done to provide proper and adequate facilities for professional training; and also to remove the sense of hardship and injustice under which those were labouring who themselves had strenuously studied in order to become efficient, in having to compete, in an inappreciative market, against others, of all sorts of trades and professions, who chose to call themselves architects, without having a single qualification for the title.

How Unfair Competition is Fostered.

The evils of which they then complained have during the intervening twenty-two years been continuously growing, supported in many cases by public authorities, and without any serious attempt by united action to check them. Further, they have been to a great extent fostered by thoughtless and incompetent members of the profession, men, some of whom have served articles in good offices, but who during their pupilage were presumably contented with the ordinary daily routine of the office, who never made any efforts to keep themselves in line with the continuous advance of scientific methods, and the development of new requirements and materials, who were never earnest in their studies, who considered the necessary preparation for examinations as "too much fag," and who as a result are now content to muddle through their work. Had these young men been compelled by law to pass a qualifying examination before commencing to practice, they would have been constrained to study. Both as an art and as a science, architecture must ultimately be degraded if practised as an interlude between selling crockery by auction and valuing the contents of a beer-house, or in the intervals between repairing a water tap and white-washing a ceiling

Registration the Only Way.

We are told that the evidence taken before a special committee of the R.I.B.A. some three years ago brought conviction to the minds of even the strongest opponents of the measures; and as all are agreed as to the evils, why cannot we agree upon a remedy? I venture to assert that a very large majority of the practising architects throughout the British Empire are agreed that the principle of compulsory examination and registration as embodied in the Bill is the only practical remedy. Then why cannot a Bill on these lines be presented to Parliament, backed by the unanimous support of the profession?

The Bill was prepared in response to a memorial signed by some 1,300 architects twenty-two years ago, and since that time hundreds of others have signified their approval of the scheme.

Compulsory Examinations.

The provision made in the Bill for compulsory examination is but carrying to a logical conclusion the principle adopted by the Royal Institute, for it cannot be consistently argued (especially after deciding that the fellowship class shall only after a certain period be recruited from among the associates) that an examination, both in the art and science of architecture, which shall afford the only means of entry to the Institute, is at the same time undesirable or impossible for testing the qualifications of all who in future desire to practise the profession. The passing of an examination test, as proposed in the Bill, would in the future be a certificate only that the person so passing was qualified to practise, and therefore entitled to be registered as an architect. It would not place him on any different plane from that occupied by other practitioners, nor would it necessarily entitle him to membership of any of the organised architectural bodies. His future success would depend upon his own exertions, and the quality of the work executed from his designs; but the

habits of observation, thought, study, and hard work, which would necessarily be encouraged and developed during his probation, would the better prepare him for the serious nature of his life's business.

The Bill Fair and Equitable.

The Registration Committee has at all times been very willing to receive suggestions for amendments to the Bill, from those qualified to offer them, and various alterations have from time to time been made, in order to meet objections raised by allied professions, thus securing, as far as possible, a fair and proper adjustment of the various interests. But although the Bill, practically in its present form, has been before the country for more than twenty years, it has not yet induced the submission of any serious alternative. Therefore I venture to say the time is now ripe for a cessation of mutual jealousies and suspicions, so that we may work with one mind. I say without hesitation that the chief object of the promoters of the Bill is to encourage systematic resort to those springs from which our art draws its perpetual refreshment. As an alternative to united action [by the various organisations], the Education and Registration Bill Committee, as delegates from the large body of architects which has subscribed to the principles contained in that Bill, will continue to work earnestly and energetically to secure its acceptance by Parliament, and take steps to bring the question prominently before the country, and, by forcing discussion, focus the light of public opinion upon what we respectfully submit are the inconsistent and sentimental objections of a small but high-placed minority.

HOARDINGS AND SKY SIGNS.

A conference of representatives of the London County Council and the metropolitan borough councils to consider by-laws under the Advertisements Regulation Act was held recently at the London County Hall, Spring Gardens. A discussion ensued on draft by-laws relating to hoardings, and it was urged that the matter should be left to the discretion of the borough councils. On the question being put as to whether or not the by-laws should be framed at all, this was decided in the affirmative. A by-law prohibiting the use of illuminated advertisements was deleted, and another which prohibited the use of "flashlight or intermittent illumination" in connection with advertising signs was similarly dealt with. At the conclusion of the meeting the chairman (Mr. Goldsmith) said he would lay before the committee of the council the points that had been raised.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Dec. 1	POSTER FOR BUILDING EXHIBITION, OLYMPIA, April 17th to May 1st, 1909. Premium £105. Open to Architects and Architectural Students only. Particulars and entry forms from H. Greville Montgomery, M.P., Exhibition Offices, 43, Essex Street, Strand, London.
Dec. 14	§BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos, Town Clerk, Town Hall, Blackpool. Deposit £1 1s.
Dec. 19	WHITTINGHAM. ANNEXE TO ASYLUM FOR PAUPER LUNATICS, for the Lancashire Asylums Board. Limited to Architects who are in practice and are ratepayers in the County of Lancashire. The new building is to accommodate 700 Inmates. Premiums of £100, £50, and £25. Particulars and plan of site from Leonard Colman, Law Clerk to Committee of Visitors, 8, Lune Street, Preston. Deposit £5 5s.
Dec. 31	*CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50, £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council, Bodmin. Deposit, £1 1s.;
No date.	SWINTON. New Schools in Cromwell Road for the Swinton and Pendlebury U.D.C. Limited to Architects having offices within ten miles of Manchester. Premiums of £50, £25 and £10. Instructions may be obtained by letter on or before November 5th, to W. T. Postlethwaite, Council ffices, Swinton, Manchester.

* *These competitions have been unfavourably reported upon by Correspondents.*

§ *The Council of the R.I.B.A. advised Members not to compete, but see note below.*

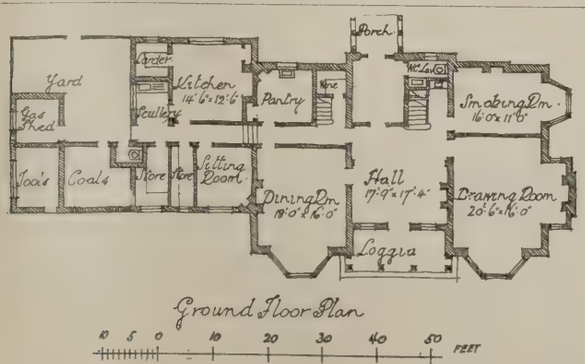
Londonderry Guildhall Rebuilding.

Members of the Ulster Society of Architects practising in Londonderry have been constrained to address the following letter to the Corporation with respect to the proposed rebuilding of the Guildhall:—

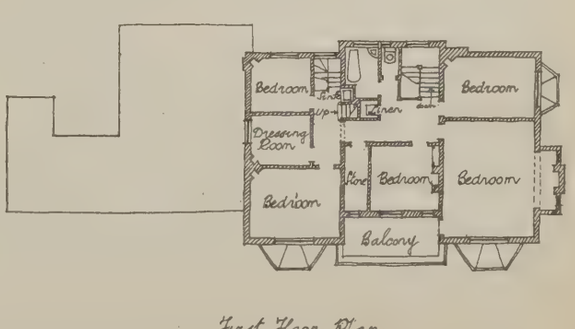
[COPY.]

"Ulster Society of Architects, Londonderry Branch, Commercial Buildings, Foyle Street, Londonderry, October 31st, 1908.—To the Corporation of Londonderry,—Gentlemen,—We, the undersigned members of the Ulster Society of Architects practising in Londonderry, having had under consideration the 'Instructions to Architects' relating to the competition for the rebuilding of the Guildhall, would respectfully ask that you reconsider and amend the following clauses in the instructions, viz.: that (1) A lithographed print of the ground floor and first floor plans of the existing building be issued to each competitor; (2), that the time for delivery of plans be made two months from date of issue of revised conditions. [The "Instructions" require the designs to be delivered not later than 4 p.m. on November 20th.] (3). That the clause with regard to the prizes should be amended to read as follows: £100 for first prize, £60 for second prize, and £40 for third prize, and that the remuneration should be 5 per cent. on the outlay instead of 4 per cent. ["Instructions": First premium, £70; second, £50; third, £30. Remuneration of architect employed to carry out the design, 4 per cent.] (4) that the question of quantities should not be allowed to enter into the competition, nor be included in the architects' fees; (5), the name of the referee should be given; (6), approximate estimate should be arrived at by cubing, stating price per cube foot, and not by approximate schedule of quantities, and should accompany competitive plans. ["Instructions": "An approximate schedule of quantities to follow seven days later than the competitive plans, showing the basis on which the estimate cost is arrived at."] We would respectfully suggest that the above alterations be made in the conditions so as to allow us to compete. (Signed), R. Eccles Buchanan, John M. Robinson, T. Johnston, M. A. Robinson, James V. Johnston, J. M. C. Knox, R. H. Nolan, James Reid, Edward J. Toye, Jas. P. McGrath."

We shall be glad to be informed of the fate of these suggestions.



Blackpool Library Competition.



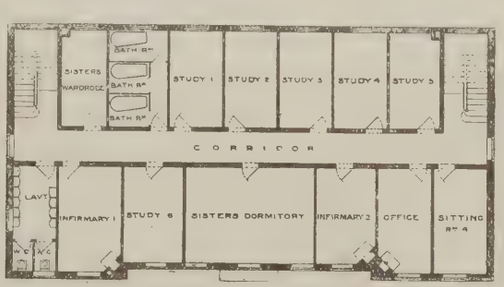
At a meeting of Blackpool Corporation held on November 9th, Alderman Heap suggested that it would be wise for the corporation to accede to the wishes of the R.I.B.A., and thus arrive at a settlement of the dispute, and this course was agreed upon. With respect to the letter from "An M.R.I.A.I.," which we printed in last week's issue, that gentleman now writes:—"It is only fair to say that the amount of my deposit has since been returned to me by the borough treasurer in response to my application for same. Probably other intending competitors who have withdrawn their names will be treated in the same manner."

Our Plate.

"Whinfell House," Crowborough, Sussex.

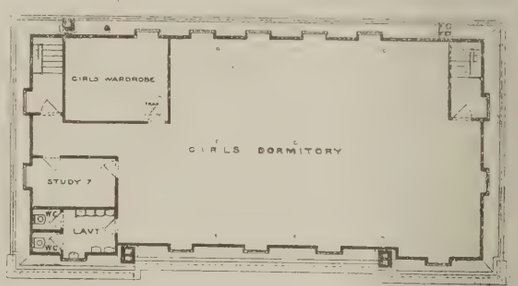
This house, now completed, has been built for the Hon. Mrs. Brougham. The walls are faced with local bricks, limewhited, and the roofs covered with local hand-made tiles. The house stands on high ground, with a distant view of Beachy Head. The builders were Messrs. Connor Brothers, of Crowborough, and the contract was £2,777. It was designed by Mr. R. G. Hammond, F.R.I.B.A., 16, Essex Street, Strand, W.C.

WHINFELL HOUSE, CROWBOROUGH, SUSSEX. R. G. HAMMOND, F.R.I.B.A., ARCHITECT.



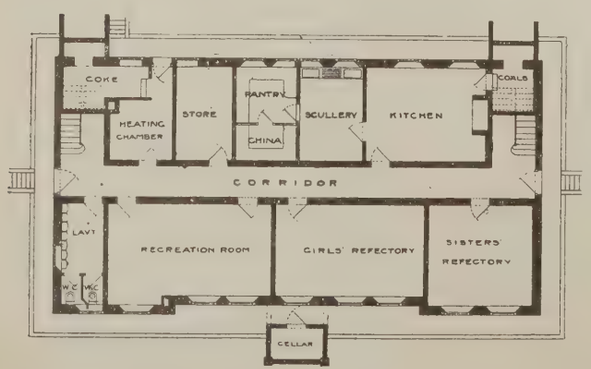
ST. JOSEPH'S CONVENT, BALDOCK. UNDERWOOD AND KENT, ARCHITECTS.

ST. JOSEPH'S CONVENT, BALDOCK.



The convent stands on a high site between Letchworth and Baldock, in the uplands of North Hertfordshire, and commands a magnificent view of the surrounding country. It is on the main road from Hitchin to Baldock, and is within one mile of the latter station on the Great Northern Railway. It also closely adjoins the estate of the First Garden City Co., Letchworth, and one of the objects of the building is to provide a good home for girls employed in the factories there. The structure, which has a south aspect, is built of red sand-faced bricks, relieved by gauged arches and dressings of Bath stone, and the roof is covered with Welsh Viking green slates. The internal fittings have been arranged with a view to minimize labour, and with that intention the building, with the exception of the infirmaries, which have open fireplaces, is heated throughout by hot water paper and radiators, and is lighted by incandescent gas. The kitchens, refectories, and recreation room occupy the basement floor. The ground floor is taken up by the sacristry, chapel, community room, work-room, and sitting-rooms. The chapel and community rooms are divided by sliding, folding partitions, as are also two of the sitting-rooms. The first floor is temporarily arranged so that no living accommodation comes directly over the altar and sacristry. On this floor are also private studies for the sisters, and the infirmaries with the sisters' dormitory in close proximity. The whole of the second floor is taken up by the girls' dormitory, which has accommodation for forty beds. Lavatories for the convenience of the inmates' washing, on coming in from work or play, are provided on each floor. Easy access to the various floors is given by a staircase in each end of the building. The convent, which is also intended to be used as an orphanage boarding house and home for ladies, was opened by the Very Rev. Canon Sumart, on September 15th, exactly seven months from the date of laying the foundations. The builders were Messrs. S. Redhouse and Son, Stotfold, and 15, South Street, Finsbury, E.C. The heating was carried out by Messrs. H. Hope and Son, 55, Lionel Street, Birmingham, and Messrs. Adamzes, Scotswood-on-Tyne, supplied the lavatory fittings. The architects were Messrs. Underwood and Kent, of 19, Leys Avenue, Letchworth, under whose personal superintendence the whole of the work was carried out.

The annual return submitted by the Housing of the Working Classes Committee of the London County Council as to working-class accommodation demolished and provided in the County of London and the adjacent district during the year 1907 shows a considerable diminution in the rate at which such accommodation is increasing, the net addition for the year being less than in any year since 1902, when the record was first obtained. The net addition to the number of rooms for the working classes in the county only amounted to 8,806, as compared with 21,475 in 1903.



The death is announced from Grenoble of the veteran painter, Antoine Hébert, member of the Institute and Grand Cross of the Legion of Honour. He was born in 1817, was a pupil of David D'Angers and Delaroche, and gained the Prix de Rome, 1839.

R.I.B.A.

Elizabethan and Jacobean House Design.

At the meeting of the R.I.B.A. on Monday, November 16th, Mr. J. A. Gotch, F.S.A., read a paper on "The development of house design in the reign of Elizabeth and James, as illustrated by contemporary architectural drawings," of which the following is a summary. Mr. Gotch explained that the subject of his paper had been suggested by the exhibition at the Institute last year of original drawings by Huntingdon Smithson, which had been kindly lent for the occasion by Colonel W. L. Coke, of Brookhill Hall, Alfreton. Mr. Gotch had been asked to write this paper in order to describe them more fully and to compare them with the better-known drawings of Thorpe. Colonel Coke had again lent the drawings for the purpose.

[The drawings were hung upon screens in the meeting-room, and many of them were shown by lantern slides.]

Huntingdon Smithson was the architect of Bolsover Castle, and was living at Bolsover in 1601. Beyond these drawings and those of Thorpe there were few, if any, extant which were made at that time of such a nature as to throw much light on the development of house design; but the two collections were sufficient for the purpose. He thought, on examining the drawings, that there was a doubt as to their being the work of Huntingdon Smithson. They were undoubtedly mostly the work of a Smithson, as a number of them were so described in a hand rather later in date than the drawings themselves. But the Christian name of Smithson was never given. The explanatory writing on the drawings themselves was nearly all in one hand; and in the same hand written against one of the drawings were the initials "Jo. S."—"S." presumably for Smithson, "Jo." for John. Robert Smithson and Huntingdon were known; but who was John? There was no answer to this question; but he was almost certain to be of the same family. Wollaton, where Robert is buried, is close to Nottingham; Bolsover is about twenty miles distant. Among the Smithson drawings are some of Bolsover; some of Welbeck, and of Worksop, in the same district; some of Clifton, close to Nottingham; two of Wollaton; some of other houses in Nottinghamshire; and there is a plan of Nottingham Castle. It would seem, therefore, that the author of them did a considerable amount of work in that neighbourhood. The drawings themselves are of varying degrees of excellence. Some are carefully executed, as though for publication; others are roughly done, as though for practical use. They comprise plans of houses and a few elevations; plans and elevations of stables; surveys of houses and of gardens; details of doorways, windows, screens, chimney-pieces, and monuments, as well as drawings of panelling, of fittings, and of a few implements. There are ninety-nine sheets in all, and probably more than twice that number of drawings, since many of the mounts contain two or more. A few of Smithson's drawings bear dates, ranging from 1599 to 1632. Some of John Thorpe's drawings are dated, the earliest 1570, the latest 1621. Hence Thorpe's and Smithson's drawings cover practically the whole of the reigns of Elizabeth and James, and furnish an invaluable series of examples showing the development of domestic architecture during that interesting period.

The planning of houses built before the middle of the sixteenth century was, as a rule, somewhat haphazard, subject always to the old-established arrangement which made the hall the chief apartment, and placed it between the family rooms at one end and the servants' quarters at the other. But in large houses and in houses which had been extended, the additional accommodation had been provided in the manner which seemed at the moment the most convenient. There was but little endeavour to arrange the various rooms systematically, far less was there any real attempt at symmetry. As the influence of Italian design grew stronger, however, symmetry became more highly prized; and by the end of the third quarter of the sixteenth century it had obtained a complete hold of English designers, and dominated their plans in the most obvious and sometimes curious way. By the time that Thorpe began to design, this change in ideas was virtually established, and accordingly we find that he made use of various types. But whatever type he adopted he always treated it symmetrically. If the symmetry did not affect the whole design it affected its component parts, such as the various façades and the courtyard; and as the years advanced the symmetry hardened, as it were; so that the latter examples are more rigidly dealt with than the earlier. This hardening is apparent not only in the plans but in the elevations. The fanciful touches which gave so much charm to the earlier buildings were gradually withheld; the treatment became more staid, the detail more ponderous. The change is noticeable in Thorpe's own drawings, and is quite apparent in comparing his with Smithson's.

The examples selected from Thorpe's drawings the author had chosen in order to illustrate the main types of plan which he adopted, the general accommodation which an Elizabethan house afforded, and the change in the disposition of the hall. With the deposition of the hall from its historic pre-eminence as the principal apartment, mediævalism practically lost its last hold on the English house; henceforward house planning was carried out on new lines. Thorpe and Smithson were the last exponents of the old tradition.

The elevations shown by Thorpe give an excellent conception of the style of the period, and tend to show how house design gradually lost its early freshness and freedom and set its face towards those paths of correctness and severity into which Inigo Jones and his successors finally led it. The author described and commented upon the plans of Burghley House, built between 1577 and 1587; those of Thornton College, for Sir Vincent Skinner, between 1603 and 1611; and of the house described on the drawings as for "Sir Walter Coap at Kensington, p'fected p. me J.T."—now known as Holland House.

In Smithson's drawings, on the whole, a later feeling is found both in the plans and in the elevations and details. Looking at them broadly and in the mass, those built towards the close of James's reign are distinctly different from those built in Elizabeth's. The symmetry which dominated Thorpe's plans is equally observable in Smithson's; if anything, it is more tyrannical. Smithson supplies us with several highly interesting examples of the lay-out of houses with reference to their surroundings—a feature entirely lacking in the Thorpe drawings. Smithson frequently indicates the position of the "garden," "orchard," and "woodyard"; in one or two instances he shows a fragment of a garden with its beds. Thorpe has a plan of Lord Exeter's house, built in 1588, called "Wymlleton, An house standing on ye edg of an hie hill," and he shows the two forecourts with their fine flights of stens leading down to the park. But Smithson's survey shows the whole of the splendid gardens, with their formal walks and flights of steps, the "banketing house," the "heges cut verie finely," the "orcharde with frute treese and roses sett amongest them," the "lyme treese both for shade and sweetnes," the "walls sett with roses," and "a great orchard with walkes nowe in plantinge." Some of the alleys are 660ft. long, and the whole lay-out is devised on a magnificent scale. It brings home to us in a vivid way the fact that splendid formal gardening was understood long before the period with which we are accustomed chiefly to associate it, the time when the third William brought over his Dutch fashions.

Smithson's elevations are not so quaint and fanciful as Thorpe's. It would almost seem as though the close study of text books had begun to stifle the imagination of designers. Fancy of a sort he did occasionally introduce into his detail, but it is fancy of rather an elephantine order. He was not nearly so ingenious in house planning as Thorpe was. The study of Thorpe's drawings is an intellectual treat. The study of Smithson's is interesting in the highest degree, but the interest is of a different kind — as much archæological as architectural. There are more clues to the history of individual buildings to be found in the Smithson collection than in that of Thorpe. They are both invaluable in their way, and they give an illuminating insight into the methods of design at a remarkable period—remarkable not only because of the number and magnificence of the buildings it produced, but also because these buildings combined in themselves the old freedom of fancy with a new and serious effort at scientific planning.

The Institute Club.

A meeting of the executive of the Institute Members' Club is to take place in the R.I.B.A. smoking-room at 5 p.m. on Thursday, November 19th.

Correspondence.

The Architect of To-day.

To the Editor of THE BUILDERS' JOURNAL

SIR,—By publishing the recent very able series of articles on "The Architect of to-day," you have done a real service not only to the architectural profession itself, but to the ever-widening circle of the public interested in architecture.

I should much like to see these articles republished in a form that would attract the attention of those outside our profession, and it would be a great gain if some of our leading daily papers could be persuaded to devote a portion of their space to a subject like this, with a view to arousing public interest in it.

The status of architecture will never be raised in the estimation of the public until it is demonstrated in the clearest possible way that it is of paramount importance that only architects of culture and training should be employed. The public should be taught to insist, even putting the case at the lowest level, the level of its own practical interests, that

all who practice and call themselves architects should at least have proved their competence to do so beforehand. In other words, the public can never be properly protected against the architectural charlatan and the incompetent practitioner until some efficient scheme of registration has become the law of the land.

The miles of hideous buildings, by which all our great cities and nearly every town and village in England is defaced and disgraced, is due in the main to the unintelligent interest and want of interest on the part of the British public in the art of architecture. And a great deal of that apathy is due to the indifference of architects themselves in their own art. Had real love of architecture and consequent enthusiasm first existed in the profession, it would have long ago reacted on the public and aroused a sense of the vital importance of Architecture in national life, and have placed it in its former right and only position amongst the arts—the mistress of them all.

That is the end in view that all architects who are worthy of the name should work for, and were there sufficient enthusiasm and unselfish devotion amongst us, a generation or so would see that end accomplished. It will never come about until there is unity and agreement in our ranks, and until the Institute is made a sure and safe medium through which the wishes of its members can be carried out.

There is a good deal of talk of educating the public in architecture, but, so far, it has been talk only, and talk, moreover, to which the public never listens, possibly because it never hears.

Cannot some united action be taken, as I have suggested, to influence the public press on behalf, not of architects, but of architecture?

To create in the mind of the public a sense of the danger it incurs by permitting the present state of things to continue, and to bring the fact out forcibly and clearly that the only possible remedy by which the public can protect itself is by placing the same barrier across the entrance to the profession of Architecture as that already placed before those of the Law and of Medicine. The vital interests of the public are at least as greatly concerned in the former as in either of the latter two, and so soon as that fact is realised by the public it will insist that architecture shall be in reality and not in name only one of the learned professions, and, as a consequence, its members educated and competent men.

F. V., REGISTRATIONIST.

Unemployment and Undeveloped Land.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May we call the attention of your readers to a method by which, without any expense to themselves or their clients, they may do something towards relieving the present overwhelming amount of unemployment?

Architects and surveyors at the present moment have control over many thousand acres of land waiting development in and near London and the larger towns. In the vast number of cases this land is lying idle and unproductive, being simply used as dumping grounds for the neighbours' rubbish. This land, however unpromising, may be of great use to the Vacant Lands Cultivation Society.

They are prepared to take any piece of land, preferably over one acre, clean it, and have it planted under capable instruction by men with families struggling to earn a living. Each acre helps to support eight heads of families, and the Society are willing to give the land up at any notice—a week if absolutely necessary—without requiring compensation.

Experience has proved this scheme to be of the greatest value in relieving distress, and should any who see this appeal have control over vacant land, we hope they will offer it to Mr. Joseph Fels, of 39, Wilson Street, E.C., who will give them the fullest particulars of what has already been done, and show plots of land in cultivation.

Apart from the good done by offering land to those most requiring it, it will readily be seen that it is a direct advantage to the owner, land under cultivation being much more desirable in appearance to a possible purchaser than a dreary waste strewn with tins and brickbats.

Cleaning Down Stone Buildings.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am very glad indeed to see this matter opened up [see issues for November 4th and 11th], as I consider its importance can hardly be overrated.

Not long ago I noticed the front of a theatre being treated by either a steam or a sand-blast cleaning process, which fetched off not only the dirt, but the stone as well. The stone peeled off in scales several inches square, and in some parts 1in. deep. The stone was no doubt in a very sensitive condition, and so are a considerable number of other stone-faced buildings in London.

I have examined a number of stone-faced buildings after they have been cleaned by modern methods, and in each case the face has had a very spongy appearance—certainly not the best kind of face to resist the London atmosphere; and in some instances there were alarming indications of decay.

Unless some reliable protective solution is applied after cleaning, the stone is bound to decay more rapidly. My acquaintance with preservatives is limited to the advertised remedies; and, so far as my experience goes, it is necessary to re-coat every few years to be effective.

I should be glad to hear of a reliable preservative for use on the stone buildings under my care; and to my personal knowledge there are many architects who would also be glad to hear of it.

Tuffnell Park, N.

The Status of the Architect.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your invitation to readers to give their views upon the status of the architect emboldens me to bring my own, of long standing, to your notice. That there is room for improvement both in architects and architecture is, of course, a matter of fact; and that there is a general wish for improvement emanating from the profession itself is a matter for congratulation. But tinkering an evil only makes matters worse; and if improvement is to be permanent, it must have scope and progression.

It appears to me that as long as the profession is over-crowded, so that architects are placed in a very dependent condition, improvement in architecture must come from the education of the public, if at all. But this is strongly suggestive of putting the cart before the horse. If, on the other hand, architects are to direct the public taste, they must be in a position to put their views in a strong light before their clients; and, for this, social position as well as competency is necessary, and this would be attained by weeding out the incompetent quack, by means of the compulsory preliminary of satisfying a thoroughly efficient examination. This having been accomplished, the way would be prepared for a complete revision of the building by-laws (which owe their inception to the shortcomings of the jerry builder and the quack). I would abolish the official surveyor, making in his place any architect (now properly qualified) who prepares, or signs, plans submitted to him, personally responsible for their conformity to the laws (with which every architect is supposed to be conversant, as it is). This throwing of responsibility upon architects would increase their importance, and relieve the profession from the unfair competition of the practising official, and the progress of architecture would be safe in the hands of properly trained men. No one need be prevented from making his own plans if he wished, in the same way that one may draw up one's own legal documents, but I would have similar restrictions as to rights of recovering fees, and plans would have to be submitted to any architect for confirmation of its compliance with the laws.

I submit, with due respect, that the Royal Institute of British Architects might do well to form some definite plan to this end, and to call upon all its members to work for it, as by organised action only is improvement possible.

S. HARRY HERON.

Red Paint that Does Not "Bleed."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your correspondent "L.M.," of Leigh-on-Sea, who makes an enquiry (in your issue of November 11th, page 367) with respect to red paint "eating its way through enamel," may be glad to know that Messrs. Williamson, Morton and Co., of Dobbies Loan, Glasgow, make a paint called "Burmese red," for which they claim that it is a permanent red, free from sulphate of barium and carbonate of lime, that it is unaffected by acids or alkalies, and that it stands sulphuretted hydrogen fumes. It is on a pure lead base, and does not "bleed" in oil, and does not come up through white lead, stands weather exposure, and alters less than genuine vermilion.

J. MAYO SMITH.

Barnet, Herts.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Salmon Ladders.

FISHER writes: "Will you, sir, or any of your correspondent, kindly give me full particulars regarding the construction of 'Salmon Ladders,' or tell me where such information, with detailed drawings, can be obtained?"

[Perhaps some of our readers can oblige.—Editor B.J.]

Books on Churches.

DERBY.—R. O. writes: "Can you give me any information of a book on Stone Church, Kent? Also a book on Ely Cathedral, dealing with them from an architectural point of view. Also price and publishers of the books."

A guide to Stone Church, Kent, by the late G. E. Street, R.A., may be obtained from the Vicar, Stone, near Greenhithe, price one shilling. Particulars and descriptions have also appeared in THE BUILDERS' JOURNAL for Sept. 20th and Oct. 4th, 1899. A short description, with complete measured drawings, may be found in Cavelar's "Gothic Architecture," Part IV. (1835). D. J. Stewart's "Architectural History of Ely Cathedral," published in 1868, is probably out of print, but a copy could most likely be obtained through Mr. Batsford, 94, High Holborn. The price would depend on the condition. Probably the volume on Ely in Messrs. Bell's "Cathedral Series" (Geo. Bell and Sons, 1s. 6d. nett) would serve your purpose. G.

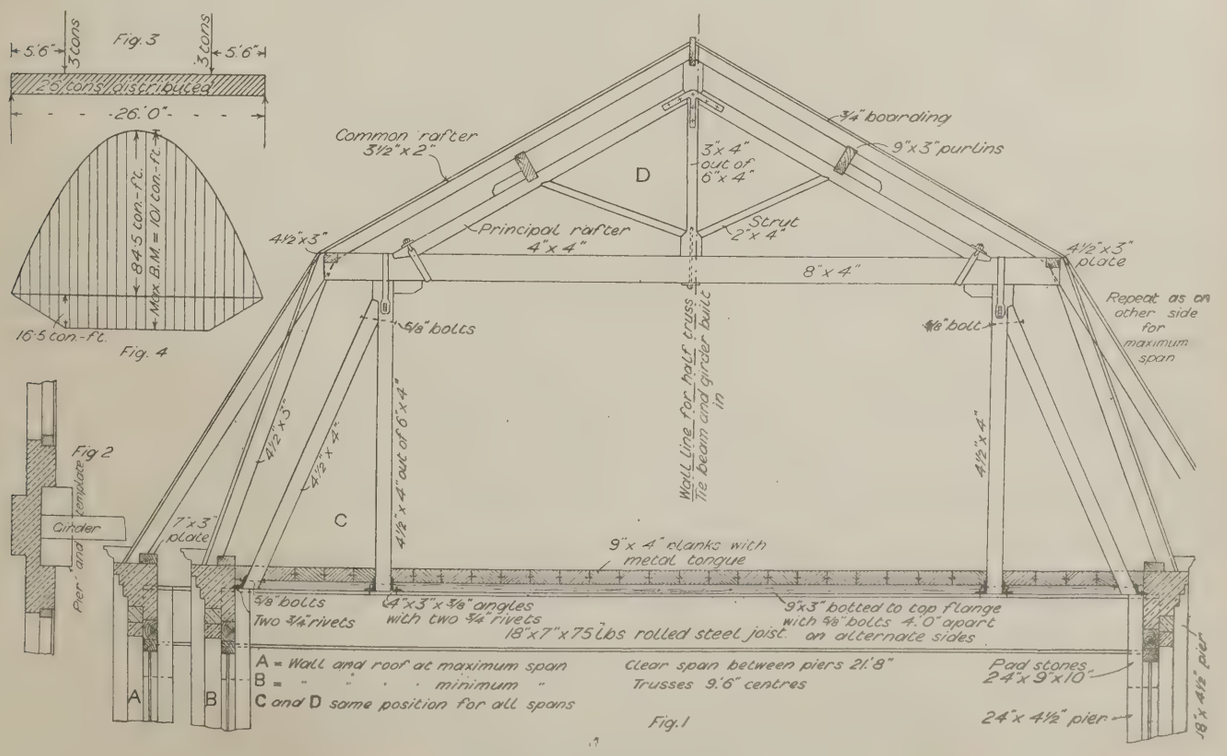
Dry Rot.

BIRMINGHAM.—MOSELEY writes: "In 1900 I bought a new house, which was doubtless built on a site which had been excavated and subsequently filled in. During the last two years I have had trouble at intervals with the floor boards, joists, or skirting rotting, and have employed two or three different builders, but none have remedied the defect. Can you oblige me with any suggestions with a view to effectual remedy? I may mention that there is no cellar.

The trouble is doubtless dry-rot, due to want of proper ventilation under the floors or to damp rising from the ground. It may, as the skirting has rotted, be due to there being no proper damp-course in the walls. Every bit of timber affected should be taken out, and the sound timber left should be well washed with a solution of corrosive sublimate, or, better still, treated with one of the preservative solutions on the market, such as "Kerno" (Kerner Greenwood and Co., St. Ann's Street, King's Lynn), or Carbolineum (C. A. Peters, Ltd., Derby). If there are no air-bricks in the outer walls under the floor level, these should be inserted two or three to each room, depending on the size of the rooms. Openings should also be made in the interior walls at the same level, so that there is a free circulation of air under the entire house. Our correspondent should also take care that the level of the soil surrounding the house is in all cases below the damp-course. It would be helpful to cover all the soil under the floors with three or four inches of concrete; but this would be expensive. If, as our correspondent suggests, the house is built on "made ground," the trouble may lie in the soil. Made ground is a fruitful breeding place for germs.

Mansard Roof Trusses of Varying Spans.

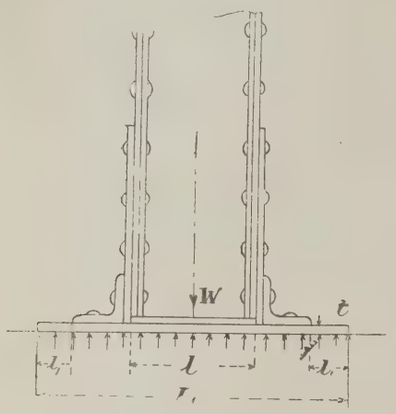
MANCHESTER.—MANSARD writes: "For a warehouse that is to be built on a tapering site, a Mansard roof is to be adopted. Nine trusses, 9½ft. apart, and a half-truss, of varying spans, are required, as shown in the accompanying plan. Please advise."



The elevation of the truss for the minimum span is shown in Fig. 1, and the plan of piers in Fig. 2. The central portion of the roof being kept in the same position, the outer rafter will have to shift outwards for the larger spans, giving a slight winding face to the lower portion of the roof. Taking a width of 12ins., the 9in. by 4in. floor planks will carry a load of $\frac{12 \times 4}{9{\cdot}5^2} = 2.12$ cwt. per ft. sup.; and as the usual allowance for warehouse floors is an external load of 2 cwt. per ft. sup., the floor-boards will be strong enough. For the main joists, with a span of 26ft., the load from the floor, including its own weight, may be taken as 2⅛ cwt. per ft. sup., giving a load on each joist of 2⅛ by 9.5 by 26 = say 520 cwt. or 26 tons. The load from the roof coming on to the queen posts = say 9.5 by 26 by ½ = 120 cwt. or 6 tons, which will be 3 tons on each, giving the load diagram as in Fig. 3, and the bending moment diagram as in Fig. 4, whence the maximum bending moment is found to be 101 ton-ft., or 8 by 101 = 808 for the tabular value of the joist required, which is (B.S.B. 28) 18in. by 7in. by 75lb. rolled steel joist. The stroke-and-dot line on Fig. 1 shows the position of the 9-in. wall, and the portion of the truss to the left of this line may be taken as the half-truss required.

HENRY ADAMS.

Calculations for a Steel Stanchion Base.



KINLOCHEVEN.—QUERY writes: "What calculations are involved in designing a base for a steel stanchion? Having decided on a stanchion, the base plate and the concrete beneath can be easily settled, but the connections of the stanchion to the base seems to require careful attention. There is frequently a space left, even if it only be 1-32in. between the bottom of the stanchion and the base plate. This stresses the base considerably, and it should be designed sufficiently strong to withstand it. The subject seems to be evaded in text-books I have consulted. Would the expense in planing the edges of the ends of the stanchions "true" be so great as not to justify it being done? Would these calculations apply also to the cap?"

The calculations that are usually made in the design of a base for a steel stanchion are few; the design being commonly worked out by rough general rules. The number of rivets necessary to connect the base plate to the stanchion proper should be calculated. This number is calculated on the assumption that the rivets distribute the whole load from the base plate to the stanchion; if W is the load carried by the stanchion, and r is

ILLUSTRATING REPLY TO "MANSARD."

the least working strength of each rivet in shear or bearing (r will be 3.01 tons for a ¾in rivet, and a working shear stress of 5 tons per sq. in), then the number of rivets required is $\frac{W}{r}$ If there be a space between the bottom of the stanchion and base plate, the stresses in the latter will be very considerable, and may be obtained as follows:—

Let the base-plate, assumed square, be of thickness t, and have each side of length L, and let the depth of the stanchion be l, see figure, then treating the portion l of the base plate as a beam, fixed at the ends and uniformly loaded upwards, we have:—

$$\text{Maximum B.M.} = \frac{pl^2}{12}, \quad \text{Modulus} = \frac{t^2}{6}.$$

taking the width of the plate as unity.

∴ if 7 tons per sq. in. is taken as the safe working stress, we have

$$\frac{pl^2}{12} = \frac{7t^2}{6}$$

$$t = l\sqrt{\frac{p}{14}}$$

but

$$p = \frac{W}{L^2} \quad \therefore t = \frac{l}{L}\sqrt{\frac{W}{14}}$$

This formula give the necessary thickness of the base plate in inches, l and L being in the same units and W in tons. As a numerical example, take

$$W = 90 \text{ tons and } \frac{l}{L} = \frac{1}{2{\cdot}5}.$$

Then

$$t = \frac{1}{2{\cdot}5}\sqrt{\frac{90}{14}} = 1 \text{ inch nearly.}$$

In a similar way, if the amount of free overhang of the plate over the angles or gusset plates is l, treating such end as a cantilever, we have—

$$\text{Maximum B.M.} = \frac{pl_1^2}{2}$$ and this as before must equal $\frac{7t^2}{6}$

$$\therefore t = l_1\sqrt{\frac{3p}{7}} = \frac{l_1}{L}\sqrt{\frac{3W}{14}}$$

The above calculations would apply also to the cap. The planing or milling of the edges of the stanchion true is often specified, and when one considers the importance of the stanchion base, this appears to be desirable; the above working shows that if there is not a true bearing of the stanchion on the base plate, the base plates as often used will be too highly stressed. Some notes on stanchion caps and bases will be found in the writer's book on "Theory and Design of Stanchions," by Ewart S. Andrews, B.Sc. (Chapman and Hall, London, 9s. nett), which is just published. A.

Proposed New Works.

Chapel-en-le-Frith.—Mr. A. W. Brightmore, an inspector of the Local Government Board, has held an inquiry at the Chapel-en-le-Frith Town Hall, into the application of the Rural District Council to borrow £2,000 for the purpose of rebuilding and renewing about fifteen bridges in various parts of the district.

Cowdenbeath.—Plans have been prepared by Mr. William Birrell, of Kirkcaldy, for a combined higher grade and mining school here, which is expected to cost nearly £20,000.

Darlington.—The following plans have been approved by the Streets Committee:—Messrs. Harker and Co., 2 houses Brighton Road; Messrs. Kitching and Lee, printing-house, Parkgate; Messrs. Brown and Son, extensions to John Street Saw Mills; new governor house at the Gas Works; Mr. R. Maughan, 2 houses Beechwood Avenue; Messrs. Clark and Moscrop, 2 houses Kitchener Street; Blake Boiler Company, new workshop.

Hull.—Mr. Hooper, a Local Government Board inspector, began, on November 8th, an inquiry into the Hull Corporation's application for leave to borrow £73,550, for completing the town hall extension scheme. The enquiry was adjourned till November 24th, when the application to borrow £24,000 for the electricity undertaking will also be considered.

London, E.C.—It appears from a report of the Improvements Committee of the London County Council that a bargain has been made by that committee and the City Corporation with regard to the improvement of Bishopsgate Street Without. Of the cost of this work, estimated at £333,900 when the matter was considered in 1904, the Council was asked by the Corporation to contribute half, and the Improvements Committee, while of the view that the improvement was desirable, did not feel justified in asking the Council to contribute in view of the Council's very heavy capital commitments. In May, 1906, the Corporation—which had had in the meantime to deal with some of the properties affected as a matter of urgency—stated that an opportunity was presented for the closing of Acorn Street, whereby owing to the increase in the area of land which would be available for recoupment, the cost of the improvement would be reduced to £313,900. The Highways Committee was anxious to provide for the construction of a tramway in the thoroughfare in connection with the existing lines in High Street, Shoreditch, and the granting of the necessary permission has been conceded by the Corporation on condition that the Council contributes half the cost of improvement. Favourable opportunities being now presented for dealing with six houses needed for the widening, which will take about two years to complete, the Council is recommended to make the contribution.

Nottingham.—The Board of Guardians decided, November 10th, to spend £6,500 on extensions to the workhouse.

Penistone.—Mr. Braithwaite's plans for an extension to Penistone Grammar School, providing at a cost of about £7,000, accommodation for girls have been adopted by the governors.

Porthcawl, South Wales.—An appeal is being made for funds for the erection of a stone church here, to seat 600 persons. The estimated cost is £1,000.

Retford.—It has been decided to erect, with the least possible delay, a cookery centre, at an estimated cost of £500.

Sheffield.—The improvements Committee of Sheffield City Council has resolved that the City Architect be instructed to report upon the schemes for the extension of the Town Hall, and on the plans prepared by the late Mr. E. W. Mountford. It is also recommended that, subject to the approval of the Finance Consultative Committee, application be made to the Local Government Board for sanction to the borrowing of £5,000, being the estimated cost of altering the gradient and widening and improving Psalter Lane, near the Salt Box cottages.

Southampton.—Mr. S. Bircham, solicitor to the London and South-Western Railway Company, has communicated to the Southampton Town Council the intention of the company to apply to Parliament in the ensuing session for power to construct new docks at Woolston on the mudland and foreshore of the River Itchen and of Southampton Water. There would be a short piece of railway between the proposed dock and the Southampton and Netley line. Details of the scheme have not yet been made public, but it is understood that they include the building of a dock capable of accommodating the largest liners in course of construction or contemplation.

South London.—Various rebuilding schemes in connection with the Duchy of Cornwall's South London property are under consideration; but the greatest of all, and one which the King, when Prince of Wales, expressed a hope to see carried out, is that connected with the vast mass of old property still known as Prince's Meadows, and at the back of Stamford Street, and between that thoroughfare and the river. It has been left to the Prince of Wales of to-day to give effect to the wishes of his Majesty, and so soon as the leases expire, in April, operations will be commenced upon the site. About 2,500 houses are involved, and it is intended to replace the present tenements with good residential working-class property, either in large blocks, of the workmen's dwelling type, or even small-class houses. The great wish of the King is that the working-class population of the neighbourhood, the great bulk of whom work upon the wharves and in adjacent factories, should have healthy homes, with respectable surroundings.

Southwark.—The Borough Council have decided to apply for Parliamentary powers to construct a subway at the Elephant and Castle. The Council has received £6,000 from the Baker Street and Waterloo Railway Company towards the cost, but has allowed its powers to lapse through inaction. The estimated cost is £15,000.

Sunderland.—Mr. A. G. Drury, M.Inst.C.E., inspector for the Local Government Board, held, on November 10th, an enquiry into applications of the corporation for leave to borrow £23,116 for works of private street paving, £2,000 for the extension of the Roker Gill outfall sewer, and £2,450 for purposes with respect to the corporation stone yard.

The Local Government Board has decided to hold, or has recently held, as the respective dates indicate, enquiries into proposed expenditure by public bodies as follows:—Water supply works and plant: Haltwhistle R.D.C., £1,900 for Gilsland and Longbyre (November 19); Ampthill and Newport Pagnell R.D.C., £7,700 and £4,973 for Apsley Guise, Apsley Heath, and Woburn Sands (including a 390,000 gallons reservoir) (November 17); Plympton Saint Mary R.D.C., new main, N.A.S. (November 18). New bridges and reconstruction.—Sculcoates R.D.C., £650 (part of new head of bridge) (November 18). Electricity works and plant: Wrexham B.C., £6,850 (November 17); Radcliffe U.D.C., £14,350 (November 18); Bridgend U.D.C., N.A.S. (November 19); Neath R.D.C., £18,000 (November 20). Sewerage, drainage and sewage disposal works and plant: Ampthill and Newport Pagnell R.D.C., £7,224 and £4,774 for Apsley Guise, Apsley Heath, and Woburn Sands (November 17); Gravesend B.C., £3,500 (November 19); Eastleigh and Bishopstoke U.D.C., £200 (November 17); Wimbledon B.C., £9,750 for dust destructor and sludge conveyor (November 20); Bradford C.C. N.A.S. (November 19); Chipping Wycombe B.C., £2,264 (November 16); Bradford-on-Avon for Holt N.A.S. (November 18); Hastings B.C., £4,407 (November 11); Surbiton U.D.C., £60,000 (November 17); Manchester C.C., £1,000 for settling pool on Medlock River (November 20); Accrington B.C., £840 (November 19); Newbury B.C., £535 (November 17); Sculcoates R.D.C., £1,900 for Sutton (November 18); Saddleworth U.D.C., £160 (November 20). Street improvements, new roads, public walks, and pleasure grounds: Devonport B.C., £2,005 and £1,824 (November 19); Uxbridge R.D.C., £2,900 for West Drayton and Yiewsley (November 17); Falmouth B.C., £1,250 and £550 (November 17); Wimbledon B.C., £350 (November 20); Bradford C.C., N.A.S. (November 19); East Kendal B.C., £1,600 (November 19); Eastbourne B.C., £500 (November 18); Manchester C.C., £11,000 and £5,000 and £2,669 (November 20); Manchester C.C., £16,675, £11,000, £5,000, and £2,699 (November 20); Accrington B.C., £1,000 (November 19); Beckenham U.D.C., £1,140 (November 18); Saddleworth U.D.C., £1,470 (November 20). Various: Eastleigh and Bishopstoke U.D.C., £450 for convenience and £400 for depot (November 17); Wimbledon, £3,273 for public baths (November 20); Radcliffe U.D.C., £5,000 for fire station (November 18); Kingston-upon-Hull, £8,300 for public baths (November 17); Accrington B.C., £4,600 for allotments (November 19); Newbury B.C., £1,500 for offices (November 17).

Works in Progress and Completed.

Chester.—Messrs. John Thompson, contractors, of Peterborough, have commenced the important work of restoring the south transept of Chester Cathedral. When it is finished, it will complete the restoration to which the late Dean Howson devoted so many years of an active life.

Doncaster.—As to the Marshgate Bridge scheme at Doncaster, it was reported at a recent meeting of the Doncaster Town Council that considerable headway had been made with the work. The Great Northern Railway Company had promised £30,000 towards the work, and of this £10,000 had been received. Possession had been taken of all the buildings to be handed over, and the contractors, Messrs. Arnold, were taking steps to employ local labour.

Epsom.—The parish church, which was consecrated by the Bishop of Winchester on November 11, will, when completed, have cost £15,000. It is being built in two portions. The first portion, now finished, has cost more than £10,000, of which sum Lord Rosebery has given £1,000. Mr. Justice Bucknill has given £250 towards the building fund, and Mr. Andrew Carnegie £500 towards the purchase of a new organ.

Hull.—The Corporation has accepted the tender of Mr. G. H. Panton, amounting to £10,889, for the erection of the Art Gallery adjoining the City Hall, in Victoria Square.

Kirkby-in-Ashfield.—The rebuilt church of St. Wilfrid (the old church was burnt down in January of last year) was consecrated by the Bishop of Southwell on November 6th. The walls are built of local and Bulwell stone, with Weldon stone dressings, and are lined internally with Kirkby stone, the inside dressed stone being from the Ancaster quarries. The cost is estimated at £8,500. Mr Louis Ambler, F.R.I.B.A., of London, is the architect, and Messrs. Bowman and Son, of Stamford, are the contractors.

Sunderland.—The West End Branch Library is in course of erection at Kayll Road. Mr. Hugh Hedley, F.R.I.B.A., Mr. W. B. Cooper, are the architect and contractor, respectively, of the new building, which is to cost £3,000.

FIRE-RESISTING CONSTRUCTION SECTION.

(MONTHLY.)

NOTES ON SOME CAUSES OF FIRE IN FACTORY AND OTHER BUILDINGS.

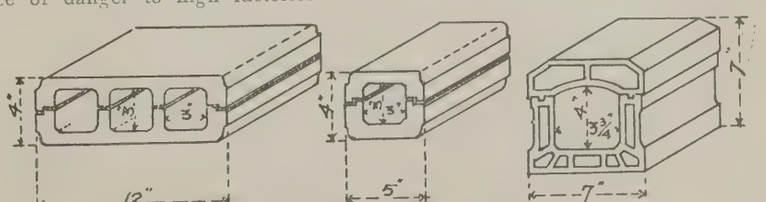
By Harold G. Holt.

Although great attention is now being paid by architects, engineers, and others interested in the promotion of new building schemes, to the prevention of fire, by more adequate structural arrangements than those prevailing a few years back, it would seem with few exceptions that the actual beginning of the trouble, the cause of fire, is neglected generally by all save fire-officers and fire insurance surveyors. It is the writer's object to draw attention briefly to one or two of the apparently remoter origins of fire, among the more general ones, and yet which, were the whole truth known, probably give rise to as many fires, on the average, as the better known causes.

Although a little apart from this subject, strictly speaking, it will be interesting to make some remark on several instances of spontaneous detonation of ammunition that have been the cause of mysterious and terrible explosions in various parts of the world. In 1905, for instance, the battleship "Mikasa" was sunk at Sasebo; in 1906 at Rio de Janeiro a Brazilian battleship was blown up; and in 1907 a terrible explosion destroyed the French battleship "Jéna" at Toulon. These unexplained catastrophes, or at least those cases in which attempted explanations have been improbable and unsatisfactory, are not confined to battleships. A great explosion destroyed ammunition factories and practically the whole of a small town in America recently, and last year a Woolwich magazine exploded at night from no apparent cause. An interesting theory has been brought forward that some possible peculiarity in the condition of the atmosphere at the time, in which unusual electrical conditions have obtained, has been the agent by which the spontaneous detonation of the ammunition in question was brought about. An explosion is, of course, a more or less stable chemical compound, and although when used great care is exercised that it be properly tested to ensure safety, yet the complex nature of the explosive and the various bodies of which it consists, render it liable to slow or sudden alteration, when it is far more susceptible to exterior forces and dangerous to store. Thus two causes are at work in the spontaneous detonation of explosives—the change in the chemical condition of the substance itself, and the action of some external agent upon the changed constituents. The former, as we have seen, may be brought about by conditions of storage, and time is an important factor. But what is the latter, the external force or agent causing the actual explosion? It has been proved that the electrical conditions obtaining in the case of the "Jéna" at Toulon were peculiar, and the vessel was electrically insulated by the wooden props shoring her up in dock. Powerful electric waves were recorded that day in the neighbourhood, and under these conditions the vibrations of the ether communicated by wireless instruments might have resulted in the explosion. When Marconi first experimented with wireless instruments it was believed that the ammunition of battleships might be exploded from a distance by the "Herzian" waves, but this view was discarded later. Yet there are other little known forces which might conceivably bring this about—they may not be electrical—but they would be difficult to guard against. Atmospheric disturbances have strange effects on the receivers of wireless telegraph instruments; exactly what is the cause is not apparently clear, and there are other waves which will easily traverse a thick steel plate and which might have the power of detonating explosives and ammunition from a great distance. The atomic theory has upset many previous ideas, and it is known now that gigantic forces are stored up in the microscopic atoms which, we are taught, compose in various forms all the bodies of which we have knowledge. An explosion, it would appear, is simply the liberation of the atoms forming the particular substance in question, and having regard to the peculiar effects of ether waves—of electric waves—(as we have not the faintest notion of what electricity really is it does not matter what we call them)—is it not conceivable, nay probable, that under certain conditions unstable chemical compounds may be detonated, or atomically disintegrated, by these waves from indefinite distances, causing explosions and subsequent fire?

There is no need to dilate on the danger attached to the placing of timber near smoke flues, or to the dangers involved in many heating and lighting schemes. Coal gas lighting is safe when ordinary precautions are taken, but some of the newer types of gas lighting in which petrol and air are mixed, forming an explosive mixture, will need very careful handling if untoward accidents are to be prevented. Defects in

Electric Light Installations,



although sometimes to blame, are not always such frequent causes of fire as is often supposed, and where they have been at fault, poor workmanship and material have been to blame rather than any inherent defect in the principles of electric practice. The increasing use of electricity for purposes of lighting and power installation and transmission require attention at the hands of architects and engineers. Electric hazards may in the widest sense be sub-divided into three: (a) The breaking down of cable insulation, with short circuiting due to innumerable causes; this is the most frequently occurring. (b) Lightning is always a possible source of danger to high factories and other tall buildings, especially where towers are engaged. (c) Electrolytic action may be sometimes the cause of fire. Gas main explosions have occurred through this cause, especially in damp situations, and electric cables should be laid well away from gas and water mains for this reason.

Frequent inspections and testing by an expert are the best safeguard against disaster, given a sound installation. Conduits should be preferably of welded iron or steel tubing, with metal junction boxes; wood casings, though good insulators, should not be employed in damp situations, and are unsafe where the current pressure exceeds 250 volts. In cotton and wool spinning mills, flour mills and other hazardous risks, wood casings should not be used at all.

Recently a fire-resisting cable—the Paterson—has been introduced, and tests have shown it to be very satisfactory. In it the ordinary conductor is insulated with Para rubber, vulcanised rubber, and taped; non-flammable manilla paper covers this, bound with braided steel wire further covered with the paper, and finished with a braiding of jute, also impregnated with a non-flammable solution. Fire-resisting conduits of fine porous terra-cotta tile are now manufactured, and Fig. 1 shows three types by the Frazzi Fire-Proof Construction, Ltd.

In all buildings where dangerous occupations are being carried on, care must be observed to keep the installation free from fine inflammable dust or "fly." In bleach works precautions against corrosive gases and vapours or dampness are necessary, and, generally speaking, where chemicals are employed in course of manufacture or injurious products are given off, these may set up a solvent action on the installation and eat it away. Where high tension work and transformers are employed, the latter should be placed in a fire-resisting chamber and well ventilated. The position and style of lamps requires consideration. Incandescent lamps frequently get very hot, and fires have been caused through this, when in the neighbourhood of inflammable material. Holders and lamps should be kept free from dust, etc., and if arc lights are used they should have double globes, unless of the "inverted" type, in which case protecting reflectors surrounding them horizontally, with the arc covered by a glass dome or globe, should be provided. They are not recommended for such dangerous hazards as spinning rooms in cotton mills, etc.

With regard to power installations the alternating or direct current systems each obtain excellent results so far as genera-

FINE POROUS TERRA-COTTA CONDUITS
BY THE FRAZZI FIRE-PROOF CONSTRUCTION LTD.

tion and distribution are concerned. The greatest speeds are probably attained by the direct-current motor, which is well adapted to close speed adjustments, but the risk of fire is greater on account of commutation, which often is not sparkless. So far as lightning risks are concerned, a good conductor system, having regard to all metal work in the building and fixed by experts, is necessary, with periodical examination. A very frequent cause of disastrous fires in factories and workshops is that of

Friction

in machinery and parts. Badly or insufficiently lubricated bearings on lines of shafting are constant sources of trouble at such points as wall box pedestals, shaft hangers, etc.

The steel shafts have bearings usually of brass, gun-metal, or phosphor bronze in certain cases, all of whose co-efficients of expansion are greater than that of steel; should the heat at the bearing increase by friction (through bad lubrication) the brasses clutch the shaft tighter and it becomes overheated to a dangerous extent. Proper lubrication should be provided in the form of a hot bearing indicator and lubricator combined, at dangerous points, with alarm bell attached to draw attention to the state of the bearing; self-lubricating hangers should always be provided. The adjustment of bearings cannot be too carefully watched; bearing surfaces must be quite even, or else irregular lubrication and overheating will result; the lubricating oil must have a high flash point.

All nuts and bolts in machine feet, etc., should be kept well tightened up; they frequently become loose and cause jarring of shaft bearings in some types of machine.

In cotton spinning mills by far the greatest number of fires are caused by friction at the headstock of the spinning mule, where a variety of motions combined with high speeds and complicated gearing are the source from which some disastrous fires have sprung. The danger, of course, is greatly aggravated by the amount of cotton fluff or "fly," as it is termed, which permeates the atmosphere and is highly inflammable; miles of cotton threads and woodwork soaked with oil combine to render the situation constantly dangerous. Some interesting figures in connection with cotton mill fires during a term of years appeared in this paper some time ago, and are well worth careful perusal.

The question of

Spontaneous Ignition or Combustion

as a source of fires in buildings is involved and complicated, but nevertheless of great interest and practical importance, and of which much yet remains to be learnt. For all practical purposes we may include under this heading the three following main divisions:—

(1) Combustion in a homogeneous mass or unit.

(2) The juxtaposition of substances liable to cause fire by possible chemical action.

(3) The storage of substances which give off inflammable vapours, possibly igniting at some distance from their location.

(1) Spontaneous combustion in a homogeneous mass is very common, particularly where vegetable fibres are stored in bulk. The theory of this is interesting. As is well known, vegetables absorb considerable heat in life, and bodies containing so much stored-up heat as cotton waste, oily rags, sawdust, etc., with all matters of vegetable origin, are particularly liable to spontaneous combustion. In decomposing, whilst the materials are gradually returning to their original elements of nitrogen, carbon, etc., the stored-up heat is set free, the amount of heat varying, of course, in proportion to the bulk of material at hand. Cotton, flax, hemp, jute, and similar fibrous goods are particularly dangerous when packed in bulk, especially should oil or fat be present, because they contain the air necessary for oxidisation in the numerous tubes of which they consist. Silk, wool, and animal fibres generally are not so dangerous, but it is manifestly impossible to prevent the presence of air in their storage. Besides this, the pressure caused by the weight of material closely packed induces heat, especially if moisture be present. These goods should therefore be stored quite clear of all possible sources of heat or dampness; the heat from a steam or flue pipe or the sun's rays has been quite enough to cause jute fires. Waste bag stores should have no window, but be well ventilated and free from dampness; cleanliness in storage is essential, as dust in these places is very dangerous and so inflammable that a spark will easily cause ignition. The most dangerous oil so far as the heating of vegetable fibres is concerned is linseed oil; mineral oils are comparatively uninjurious.

(2) Numerous instances arise in which chemicals placed together will give rise to chemical action and take fire; a few instances will suffice, however. Acids need care in storage and handling; nitric acid acting on charcoal, turpentine and other carbonaceous bodies, also sulphuric acid in many cases would cause fire. Generally speaking, substances rich in oxygen should not be placed in contact with easily oxidisable matter. Bleaching powder, giving off chlorine gas, coming in contact with turpentine or tarred rope, has caused fires, whilst permanganate of potash and glycerine, mixed, cause fierce combustion.

(3) Many bodies in common use give off highly inflammable vapours, one of the commonest examples being that of coal, which gives off gases, and through insufficient ventilation the latter hang about until ignited by stray sparks, etc. Coal bunkers, where much coal in bulk is stored, as for electric generating stations, should have constant through ventilation provided. Many highly volatile bodies which are extremely useful in manufacture and textile works, especially crude oils (such as petroleum) consisting of a mixture of various hydrocarbons, give off vapours at comparatively low temperatures. Some require considerable heating before this takes place, and the temperature which has to be attained before vapour is given off is termed the "flash point." The temperature at which actual ignition takes place is generally higher than this, but it is obvious that if the flash point be too low, and vapour is given off at ordinary temperatures, serious danger is imminent. These inflammable vapours are usually heavier than air, and this constitutes a grave danger; they "creep" along the ground often to a good distance, and may be ignited at any point on the journey whereon the flame will flash back and fire the whole material in bulk. The storage of oil in crude or even distilled form is therefore rendered a matter of difficulty. One or two curious instances have come to light in which men have found sewers aflame, sometimes through the leakage from motor garages, despite the precautions adopted in using multiple-seal traps and catchpits.

No oils produced by distillation of coal, Rangoon oil, petroleum, etc., should be used for illuminating purposes with a flash point under 110 degs. Fahr. Colza oil is the safest illuminant.

Valuable information can be gleaned from the reports published under the auspices of the L.C.C. Fire Brigade, obtainable for 1d., as to various causes of fire, and advice is given respecting their prevention.

To achieve the best results and make progress in what may be called the science of fire protection, it is necessary to begin with first principles and work from them, rejecting adventitious methods, and it is hoped that these notes, cursory as they are, may be of service in elucidating one or two matters in this regard which appear to have been somewhat neglected.

A FIRE PREVENTION CONFERENCE AT PARIS.

Proposed Fire-testing Station for France.

France has taken up to the present but little interest in matters of fire-prevention, and such really up-to-date measures as exist are limited mainly to Paris, where M. Lepine, the great police prefect, can influence such matters, and does so in a most able way. His theatre regulations of August last, the measures he adopted for the protection of tube railways, and similar measures, all speak to his thorough grasp of the essentials of fire prevention, but the work he has done in this direction is scarcely appreciated as yet in the Paris professional circles, and is not understood at all in French provincial centres. The general ignorance in France of the fire-preventive side of fire protection is, in fact, quite abnormal, which fact is the more surprising as the fire service side has been most carefully regulated by the State, and few Governments have given so much thought to the organisation of fire brigades on national lines.

An effort has been made of late by a small group of inventors and manufacturers to obtain greater prominence for the subject of fire prevention, and their own wares in particular, and although the public authorities fully recognised the somewhat unfortunate industrial aspect of the movement, matters of this kind are looked at from a different point of view than in England, and a certain amount of official patronage was accorded to the efforts referred to, the proposal being, we believe, that if some of the ideas of the industrial interests put forward find favour in professional circles—as they must eventually do—the public officials and leading members of the profession concerned are to take the lead and place the movement on a proper basis.

An outcome of the effort referred to has been a meeting or conference held at Paris recently, at which M. Lepine, the police prefect, acted as honorary president, and at which the various French public departments concerned were represented. An attempt was also made to obtain support and advice from abroad, and also to clothe the conference with that magic description: "international." By dint of official notification and invitation through the various foreign offices, this attempt was also successful, Mr. Ed-

win O. Sachs (chairman of the British Fire Prevention Committee), for instance, going over to Paris to assist as far as Great Britain was concerned, Colonel Meyer of Copenhagen (the late president of the International Fire Service Council) attending from Denmark, Chief Officer Reichel, of the Berlin Fire Brigade representing Germany, Professor von Empberger coming on behalf of Austria. As a result of this assistance from abroad, there is a probability of some good work eventually being done in France on lines similar to that of the British Fire Prevention Committee, and a proper fire testing station will, no doubt, in due course, be formed from which reliable and independent reports can be obtained. An effort has, indeed, already been made lately to conduct some tests on a piece of ground allotted for this purpose near Paris; but the appliances, facilities, and methods of conducting the tests are so elementary, and the reports so full of personal opinion, instead of facts and scientific data, that these testing efforts, up to the present, are not only of no technical value, but somewhat of a menace at present to proper developments of the subject. All this will, no doubt, be altered, now the movement enjoys the presidency of Mons. Lepine, and the executive officer of the new Paris organisation has, as a matter of fact, visited London this month to see how the work is done over here, for the purpose of applying the British procedure.

There was a general wish expressed at the conference that the methods of testing and form of reports adopted by the British Fire Prevention Committee, shall be strictly adhered to; and if this is done at Paris, another excellent step will have been taken towards standardising the fire tests of the world. At present, the British standard ranks as the universal standard for the United States, Germany, Russia, Belgium, and a number of smaller countries. The inclusion of France would indeed be a gain. There was, indeed, a fairly animated debate on the question of keeping the reports on tests to facts only, as against the present French method of adding personal opinions and advice, and it was pleasing to observe that there was very nearly unanimity as to limiting reports to facts only, although this is somewhat contrary to French custom, where a general airing of personal views and arguments is often to be found in all manner of reports where the personal element is least wanted.

Of matters before the conference, other than the formation of the French Committee and the conduct of tests, we would mention the proposal to publish in a tabular or code form, the measures at present adopted in the interests of fire prevention in different countries. This would certainly be a useful compilation.

Fires in Forests, Fires in Railway Trains, and other matters of this kind were under review.

Altogether, however, the meeting lacked the professional knowledge and keenness we are used to at British, American or German meetings, for with the exception of the strangers present from abroad, and the officials, representing the Ministers, Municipalities and Railway Companies, the parties present were practically amateurs, new to the subject, without knowledge of the doings and literature of other countries, and to put it quite plainly, extraordinarily uninformed.

The conference, however, merits our good wishes, if only as marking the commencement of a new era in fire prevention for France, and there can be no doubt that when the right men take up the matter, as they now will do, France will soon attain the position it has gained in so many other subjects, as a leader of scientific research.

Fires such as those of the Charity Bazaar, the Paris Metropolitan Tube and the Paris Telephone Exchange, were all mainly due to the lack of fire preventive measures, so that the need for work on the fire preventive side in France is very apparent, and claims the closest attention of those concerned.

PRECAUTIONS AGAINST FREEZING.

As many of our readers are interested, as consultants or otherwise, in large industrial concerns, we think it will be useful to reprint a seasonable warning recently issued by an insurance association:—

As the season is now at hand when fire apparatus and water pipes generally are liable to freeze, we submit the following suggestions for protection:—

1st. Examine tanks and all pipes, fittings, and valves, whether for steam heating, general water service, or fire protection. See that none are frozen or have been frozen, and that they are all in operative condition, and where there is any liability of freezing, arrange the necessary protection.

2nd. See that all valves are open that should be open, and try water outlets, in order to ascertain whether all pipes are free and ready for service.

3rd. See that extra sprinklers are on hand in case of need to replace frozen or melted heads.

4th. Be sure that your engineer is fully posted as to the purpose and intention of every valve and pipe.

5th. Try your pumps and see that they are in proper working order.

6th. Test all the hydrants and indicator posts, and see that they drain properly.

7th. Instruct the night watchman thoroughly in the use of all fire apparatus and the operations of all valves.

8th. Examine the end of suction pipe to see that leaves or other refuse matter have not clogged up the holes in the strainer. We have had cases reported by our inspectors where the capacity of the pump has been greatly reduced by this means.

9th. We take this occasion to call your attention to the liability of freezing of water in casks and pails in cold buildings, and suggest that you take measures of prevention, at the same time avoiding danger of water damage.

10th. Chemical extinguishers should be emptied and recharged to insure their being in perfect working order.

AMERICAN FIRE TESTS WITH BUILDING MATERIALS.

We have previously mentioned that some interesting fire tests are being undertaken at Chicago by the Board of Underwriters with fire-resisting materials —materials as distinct from systems of construction—and in a previous issue we have published some few results of tests of this description, which were very favourably to concrete, particularly when made in a more than ordinarily rich and wet state.

The tests which are being conducted in America are somewhat different from those of the British Fire Prevention Committee, being more of a laboratory character than what might be termed full-size tests under natural conditions. In other words, the flame applied is more of the character of a gigantic Bunsen burner playing horizontally on to vertical slabs of the material under investigation, rather than there being a volume of fire, as would be the case in an actual fire. But, for purposes of comparison, the precise arrangement is perhaps immaterial, even if the severity of the test is also of a more moderate character than what is required in London, the duration being two hours, whilst for the full protective class in this country a four-hour test is essential.

To give some idea of how the tests are conducted with slabs, we are presenting

AMERICAN FIRE TESTS ON SLABS. FIG.

AMERICAN FIRE TESTS ON SLABS. FIG 2.

two photographs kindly put at our disposal, from which it will be seen that the test vertical slab is moved into the retort house on rollers, and then brought out from the retort house, and played upon with water in the open.

At a time when ever-greater importance is being attached to official tests from the fire point of view, any information that leads towards a better appreciation of the value of tests should be of use to architects.

FIRE-RESISTING BONDED WAREHOUSE, WASHINGTON STREET, GLASGOW.

A large building of the warehouse type has recently been completed in Washington Street, Glasgow, under the supervision and from designs of Mr. Clifford, architect, of Glasgow, the general contractors for the works being Messrs. Paterson and Son.

In a building of this description, and one in which a large quantity of spirit is stored, one of the most important points to be considered is to have reliable fire resisting construction. This has effectually been carried into operation by Mr. Clifford employing steel and concrete construction for the floors throughout.

The main steel joists are spaced at from 14ft. to 15ft. centres, running in opposite directions, on alternate floors, thus effectually tying the building together.

The reinforced concrete floors have been constructed by the Columbian Fireproofing Co., Ltd., under their system of construction, which was tested by the British Fire Prevention Committee some years back, and consists of ribbed steel bars 5ins. deep, suspended by means of steel stirrups from top flange of R.S.J. at 18in. centres, the whole embedded in breeze concrete 8ins. thick. The whole of the steel joists are encased in concrete on the Columbian system by using a slab fixed by iron clips to lower flange of joists, and the sides filled in with fine concrete. The stanchions are encased in solid concrete and formed octagonally on plan.

These floors were constructed to carry a load of 4cwt. per ft. super., and are now loaded to the extent of about 2½cwt. per ft. super., and not the slightest sign of deflection is visible.

VIEW OF A FLOOR OF WAREHOUSE, WASHINGTON STREET, GLASGOW.

Such a system of construction is well suited to warehouses, as the Columbian floors give considerable strength with but a comparatively small depth, thus saving height in a building and consequently money.

Exterior View.

FIRE-RESISTING BONDED WAREHOUSE WASHINGTON STREET, GLASGOW.

The experience of the Wandsworth Board of Guardians in dealing with the "Battersea unemployed," the "Westminster Gazette" remarks, is instructive. The Board undertook the building of a new infirmary as a means of increasing the supply of work; but the chairman, in answer to a deputation demanding that more should be done, said, "It was a sad reflection that of the men they employed on this new infirmary 10 per cent. had to be discharged for drunkenness or inattention." This experience seems to emphasise the expediency of offering work only under the ordinary conditions as to wages and dismissal. Work given to the unemployed as "the unemployed" would have filled the places of the sober and attentive with the drunken and inattentive.

MESSRS. BUCHANAN & BROS.' NEW BLOCK, GLASGOW.

The object of Messrs. Buchanan & Bros. in arranging for their new block of buildings in Maitland Street was to obtain a structure of considerable fire resistance that would at the same time give the most ample space, light, etc., suitable to the site. The building they have put up is 100ft. by 50ft. by 65ft. high, and consists of six floors, a flat roof, columns, staircases, and lift frame, as well as outside walls built on the Hennebique system, and thanks to the general arrangement of windows, doors and partitions, which by-the-bye are also of a fire-resisting type, the very white interior and the thinness of the walls, there is no doubt the maximum of light and space have been secured.

FIRE-RESISTING WAREHOUSES: MAITLAND STREET, GLASGOW.

The floors have to take 2½cwt. per foot super. and the roof 2cwt. per foot super.; they have been tested for these loads.

Speaking from a general point of view, the importance of this class of building in Glasgow, being of a fire-resisting character, is considerable, especially in view of the number of fires continually occurring which might at any time lead to a serious conflagration. From the point of view of warehousemen, manufacturers, etc., it is even more so, as they not only have immunity from fire as regards their building and the possibility of fire caused by the goods themselves spreading from one floor to another, but the rates of insurance are reduced and a thoroughly up-to-date building, free from maintenance, is secured.

The whole of the works have been designed and carried out under the supervision of Messrs. Wyllie and Blake, civil engineers and architects, Glasgow.

The contractor for the reinforced concrete work was Mr. W. T. Weir, of Howdon, Newcastle-on-Tyne.

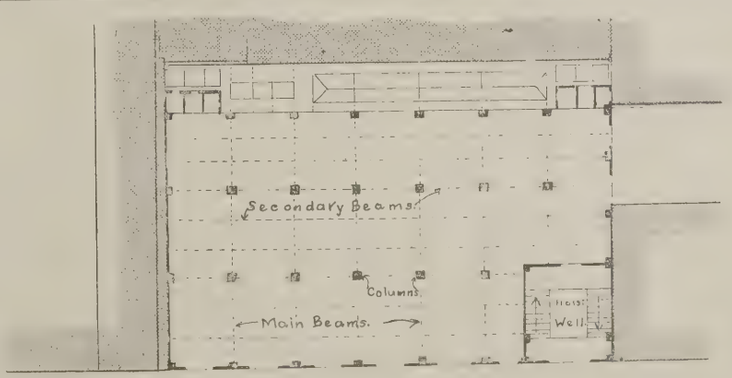
Before the meeting of the Surrey County Council at Kingston, on November 10th, Major Coates, M.P., the chairman, on behalf of the magistrates of Surrey and the members of the county council, handed to Mr. Frank Howell, the county surveyor, a cheque on his retirement after fifteen years' service. The money is to be expended in the purchase of George I. plate and a telescope, with an observatory in which to erect it.

FIRE-RESISTING WAREHOUSE, MAITLAND STREET, GLASGOW.

FIRE IN THE PARKER BUILDING.

In our last fire issue, we presented some important particulars regarding the Parker Building Fire, together with some illustrations of an exceptional character. Since then the Red Book No. 132 of the British Fire Prevention Committee has been published, and we observe that it contains an important report by W. C. Robinson, Chief Engineer to the Underwriters' Laboratories, Chicago, concerning this particular fire, which is presented with a preamble by Mr. Edwin O. Sachs, F.R.S.Ed., pointing out how important the lessons of this fire are to this metropolis, having regard to the fact that London contains quite a number of buildings, if not of the same great height as that of the Parker Building, at least not of dissimilar construction.

Having regard to the calculations arrived at by Mr. Robinson, the report should be of special value to the metropolis, and to those acting for public authorities in particular.



We give the following characteristic utterances of his:—

Cast Iron Columns.

"Cast iron columns should not be used in high buildings, as their failure is usually complete, and results in sudden total collapse of the sections supported. Girders and beams cannot be rigidly attached to such columns, and defects in the material cannot be easily detected."

Fireproofing.

"It is essential that all structural members of fire-proof buildings be protected by a sufficient mass of fire proofing to insulate them thoroughly against the heat which would be developed by the rapid burning of all materials permitted in any storey of such buildings. It is also essential that all fireproofing be firmly anchored, or otherwise securely held in position, where it is of such a nature or so designed that it will become loose as a result of heat. On account of their very great importance

PLAN

FIRE-RESISTING WAREHOUSE IN MAITLAND STREEET, GLASGOW.
WYLLIE & BLAKE, CIVIL ENGINEERS.

structurally, columns should be insulated by at least four inches of fireproofing; and no pipes or conduits should be placed in or back of the fireproofing material. On account of the heavy mass of fireproofing with which girders and floor beams are in contact, a lesser amount of protection can be safely employed at the soffits. Generally, this should not be less than two inches for girders and one and one-half inches for floor beams.

Loads.

"All floor keys should be provided with a large factor of safety, so as safely to carry the imposed loads, not only under ordinary conditions, but when severely exposed by fire."

Safes, etc.

"The support of heavy safes and machinery on wood floors and wood skids in fireproof buildings is a menace to both life and property, and should be absolutely prohibited. Heavy shafting should be attached to ceilings in such a manner that it will not fall as a result of fire.

Openings.

"Exterior openings in buildings should be thoroughly protected against exposing fires. Universal efficient fire protection of exterior openings will practically eliminate the danger of conflagration in cities.

Floors.

"Buildings of large unbroken floor areas filled with combustible contents develop the severest fires and constitute one of the most dangerous sources of general conflagration. Floor areas in buildings of this character should be subdivided by substantial brick fire walls sufficient to form a positive barrier of the spread of fire."

Perhaps we should add that the Report was illustrated by some 30 plates giving detailed constructional drawings, and photographs from the actual fire.

HIGH PRESSURE WATER-MAINS FOR FIRE EXTINCTION.

The recent successful installation of high-pressure water-mains for fire extinction in New York once more raises the question as to why the London County Council have not as yet taken advantage of the London Hydraulic Power Company's mains, which are laid through most of the principal thoroughfares, particularly in the City and West End. The best results are obtained by a combination of Metropolitan Water Board water and hydraulic pressure water by means of injector hydrants; and at a fire which occurred recently at a large brewery on the south side of the river, the Fire Brigade used the hydrants on the premises which are worked on this principle, and found them to be satisfactory. If this was the case with premises easily accessible to fire engines, surely it would be to the general advantage to have similar arrangements made for street hydrants in or near the many narrow courts and alleys which are difficult of access.

We learn from the Power Company that there are now about 162 miles of mains between Wapping and Kensington on the north, and Rotherhithe and Vauxhall on the south side of the river, ample power being available from their six large pumping stations, each of which can supply any point of the system.

The high-pressure water-main system was used for fire extinction in New York for the first time on October 28th, when a fire at a five-storey factory was extinguished in fifteen minutes. Lines of hose were attached direct to the street hydrant, which received water pumped through underground mains by a central pumping station. It seems that the entire city below Fourteenth Street is now protected by sixty-five miles of new underground pipes connected with two pumping stations, from which operations are directed by telephone.

BRITISH FIRE PREVENTION COMMITTEE'S TESTS.

Fire Extinguishing Appliances.

The British Fire Prevention Committee's autumn session has been one of particular activity, every alternating Wednesday, practically, being occupied with important fire tests.

We have mentioned in previous issues the tests that have been undertaken with ordinary small fire extinguishers, and also with the large 125-gallon extinguisher suitable for permanent installation in country houses, where it is rare to find a reliable water-pressure.

Two further afternoons in October have been devoted by the Committee to testing extinguishers intended to put out petrol fires—a subject of the utmost importance at the moment, having regard to the serious increasing fire-risk involved in motor traction and the numerous garages that are being built or formed out of stables all over the metropolis.

The petrol extinguishers, which were subjected to some twenty-four tests spread over two afternoons, are in appearance much like the ordinary extinguisher, but emit a chemical mixture that is intended to put out petrol, and, if we are informed rightly, results were of a satisfactory character.

At this particular series of tests, Mr. Percy Collins, J.P., acted as directing member, assisted by Mr. Ellis Marsland (District Surveyor), Mr. Chatterton (Yorkshire Insurance Company), Mr. Farrow, F.R.I.B.A., and others, whilst the Council of the British Fire Prevention Committee was represented by Mr. Edwin O. Sachs, F.R.S.Ed., and there was a large attendance on behalf of the public authorities primarily concerned, such as the Home Office, Admiralty, etc., the insurance companies, automobile organisations, etc.

Fire-Resisting Shutters.

What we, however, believe will be one of the most valuable series of tests the Committee has been conducting will be the continuation of a series of tests with metal roller shutters.

It may be recollected that about three years ago there was a series of this description in respect to Kinnear roller shutters, made in the United States and brought into this country by Messrs. Gibson, of London.

In the first instance a single shutter was tested in 1905 for 1½ hours, as affording "Partial" protection, and obtained this classification, i.e., Partial Protection, Class "A," under the Universal Standards for Fire Tests. Thereupon a single shutter was tested for 2½ hours for the purpose of obtaining classification of "Full" protection, Class "A"; and a double roller shutter was tested for a four-hour test for the purpose of obtaining classification "Full" protection, Class "B," the highest classification obtainable, and in both cases classification was obtained. In the first instance the single door was on an opening 9ft. wide by 8ft. high, and in the last two cases there were two openings 7ft. wide and respectively 7ft. 6in. and 8ft. high.

The advent of these shutters practically revolutionised the whole question of closing large openings, and in large structures of cubic extent, such as that of Messrs. Selfridge, in Oxford Street, it was the proof of the resistance shown at these official tests that practically gained for them the sanction of the London County Council on so important a structure. Further, had it not been for the results of these tests, Parliament would not have been able to include roller shutters among the means for closing openings in party and division walls.

The Committee are now continuing this series with another type of shutter made by the Wilson Manufacturing Company, of New York, and put forward in this country by Messrs. Mountain and Gibson, Ltd., of Bury.

On Wednesday, November 4th, the first two tests were undertaken out of a series of four tests which the Committee have in hand with these shutters. This series comprises one test with double roller shutters and three tests with single shutters, all to openings 7ft. wide.

Regarding the double shutter test, we understand this has been completed, and that the formal intimation has been received by Messrs. Mountain and Gibson, Ltd., that they have passed the "Full" classification of a four-hour test (full fire protection—Class "B"), which involves application of fire to temperatures up to 1800 deg. Fahr., followed by the application of water from a steam fire engine for five minutes. The official report on this double roller shutter door test should be issued next month, and should prove most interesting reading.

The three single roller shutter door tests will be completed in a few weeks, and reported on in December. They comprise:—

1. A test with a single roller shutter (official test).
2. A test with the same single roller shutter renovated after the first fire test for the purpose of indicating whether such shutters can be renovated and made to work again after an ordeal of fire (experimental test).
3. A test with a single roller shutter door of slightly different make (official test).

In each case these shutters are to be tested on 7ft. openings.

To what extent the technical professions and public authorities are interested in these tests may be gauged from the fact that at the first tests on Wednesday, November 4th, the attendance of the members and representatives of the authorities was quite of an exceptional character. Sir Henry Tanner, I.S.O., principal architect to H.M. Office of Works, personally represented the Council of the British Fire Prevention Committee; Colonel Sir Edward Raban, K.C.B., director of works, Admiralty, represented the Admiralty, and nearly every Government Department had delegates. Mr. Edwin O. Sachs, F.R.S.Ed., and Mr. Percy Collins, J.P., attended on behalf of the Executive, and there was a strong sub-committee in charge of the tests, with Mr. Max Clarke, F.R.I.B.A., as directing member; Mr. Ellis Marsland and Mr. Grellier, F.R.I.B.A., (district surveyors), Chief-Officers Dyer and Henderson (vice-presidents of the National Fire Brigades Union); Mr. Garbutt, A.M.Inst.C.E., and Mr. Fulkes (insurance surveyor).

These roller shutter door tests are of the greater importance for London at the moment, having regard to the question of protecting door openings in buildings of large cubic extent, or the combination of several buildings as permitted under the new Act, for there can, of course, be no doubt that roller shutters generally are of far greater convenience than doors in establishments such as drapers', etc., having regard to the small space into which the door covering can be stowed away overhead when the doors are open.

Notes and News.

Face Bond Building Bricks.—Mr. William Burrough Hill, F.S.I., architect and surveyor, of Southampton, has issued an interesting booklet describing a patent brick designed particularly for use in hollow or cavity walls. In this class of wall, as headers must not cross the cavity, a difficulty arises as to the bond to be adopted. "Garden-wall," "chimney," and "stretching" bond are detrimental to the appearance of the building; and, if "Old English," "Flemish," or other approved bond is adopted, the headers become bats, and the strength of the work is lessened, while labour and waste are greatly increased. The patent face bond building brick will enable the adoption of any kind of bond; the bricks being grooved at suitable intervals for the reception of mortar for the formation of a false or superficial joint, thus giving the appearance of a handsome bond. Thus, one brick is grooved to represent a header and stretcher; another would look like a stretcher and closer; and others are grooved to represent respectively two headers, a header and two closers, a header and closer, etc. The patentee has hit on a notion that, while extremely simple, is at the same time very ingenious. The innocent deception involved in the display of sham joints is perhaps justified by the increase of strength, and by the superior general appearance of the wall surface in which the face-bond bricks are adopted.

* * *

Timber Reserves of Queensland.—In the annual report of the Public Lands Department of Queensland, it is stated that the timber reserves of Queensland aggregate 3,255,751 acres. The Government have done well to set aside these extensive areas, as the saw milling industry is extremely active; in 1907 there were cut 57,274,629ft. of soft woods, and 33,925,650ft. of hardwoods. The local value of softwood worked out at 12s. 2d. per 100ft., and 13s. hardwoods. The beautiful cedar wood of Queensland, specimens of which were to be seen at the Franco-British Exhibition, is valued at 30s. 6d. per 100ft., and of this 552,000ft. were cut in the Colony in 1907. The progress of forestry in the State during the year has shown a very distinct advance. The permanent reservation of nearly 500,000 acres of areas as State forests marks a very great advance on anything previously attempted in the direction of permanently conserving the timber supplies of the State.

The memorial to Sir George Williams, founder of the Young Men's Christian Association, that was unveiled in the crypt of St. Paul's Cathedral recently, comprises a bust of Sir George, executed in marble by Sir George Frampton, R.A.

THE MAKING OF ABERDEEN

"Archibald Simpson, and the Making of Aberdeen," was the title of a paper read at a meeting of the Aberdeen Architectural Association on November 7th, by Mr. G. M. Fraser, librarian of the Aberdeen Public Library.

By visiting London and the Continent, Simpson was able to refine and extend his knowledge. He returned to his native city in 1813 or 1814. Gradually he came to be recognised, and he ultimately raised public and private buildings in Aberdeen that led to a complete transformation in the appearance of the city. John Smith, who was city architect for nearly ten years before Simpson got his chance, raised many buildings in the city of high architectural quality, and showed engineering capacity far beyond what Simpson ever possessed; yet, in his most ambitious designs, he seemed almost afraid of his own movements, and lacked the spontaneity and freedom which were characteristic of most of Simpson's work. Simpson, in 1818, received a commission for the Medico-Chirurgical Hall in King Street. This hall was the first building in Aberdeen to reveal with convincing force, in its simple, strong Ionic, how effectively the hard angular granite of the district could, when properly treated, be used in public architecture. The Music Hall in Union Street raised Simpson enormously in public favour, and then it was that the people began to take an interest in the architectural development of the city. Simpson was appointed architect for the lunatic asylum at Clerkseat, and took a prominent part in the laying out of Bon-Accord Square and Bon-Accord Crescent. Simpson regarded the Royal Infirmary as his finest work. Simpson's design for a new East Church was accepted, and he drew the designs of several private residences in Albyn Place, including the building known as the Girls' High School. The bank buildings at the corner of King Street, the erection of the New Market and the laying out of Market Street, Hadden Street, and Exchange Street, were also Simpson's work.

GLASGOW CENTRAL STATION EXTENSION.

At the ordinary meeting of the Institution of Civil Engineers held on Tuesday, November 10, Mr James C. Inglis, president, in the chair, Mr. Donald A. Matheson, M.Inst.C.E., engineer-in-chief, Caledonian Railway, read a paper on Glasgow Central Station Extension. The Central Station in Glasgow is the principal station on the Coledonian Railway. It is a terminal station, situated in the heart of the city, at or in the vicinity of the main thoroughfares and the River Clyde. It is constructed partly over the river, and over several streets, as well as over the Underground Railway which runs longitudinally under Argyle Street. The original station was opened in 1879; but, as the traffic has been almost constantly increasing, the accommodation has had to be enlarged twice within about twenty years. The site is a difficult one, by reason of its position relatively to the River Clyde and to adjoining public streets. This affected the designs.

The platforms are 24ft. to 33ft. above the level of some of the main streets which are crossed. The substructure is therefore a costly work of considerable magnitude. It consists of an extensive bridge over the River Clyde, and masonry arching and steelwork construction over and between the streets. These structures carry the station yard and the lines and platforms of the station proper. The space underneath the lines and platforms provides accommodation for a spacious parcels office and other purposes. There are altogether thirteen platforms, but the width of the station at the concourse is so narrow that their ends had to be stopped in echelon. The concourse therefore lies obliquely to the lines and platforms instead of at right angles, as is more usual. The lengths of the main traffic-platforms range from 800ft. to 900ft., and of the less important from 450ft. to 610ft., while the widths vary between 22ft. and 30ft.

The platforms are roofed in to about 86 per cent. of their length. This is a greater proportion than is usual, but the climatic conditions of Glasgow are exceptional. The roofing of the new part of the station, which is about 900ft. long, is constructed of steel and glass, and the girders being elliptical in form there is pleasing vista in the length. The character of station roofing generally is discussed, and the roofing of Liverpool Street Station is set up as being ideal.

The paper concludes with some reference to the principle in design. The author considers it doubtful if more than a very general principle exists, since so much depends on local circumstances.

The works were designed and constructed under the direction of the author, with Sir John Wolfe Barry, K.C.B., past-president, Inst.C.E., as consulting engineer.

WOLVERHAMPTON MODEL HOUSING EXHIBITION.

Judges' Report.

The judges, in their report on the Model Housing Exhibition, Fallings Park, Wolverhampton, notice some of the points that particularly arrested their attention when viewing the various types of houses presented for their inspection.

"It is not enough," the judges say, "that a cottage should be presentable from the road—it should be the study of the architect and builder to make it sightly to its neighbours also. This requisition adds considerably to the difficulties of the problem, both in the matter of expense and planning—but it is one that cannot be ignored. It is an integral part of communal living, one hitherto scarcely recognised, but deserving every encouragement, for it is a form of self-respect. It is attention to the so-called small matters that really counts in easing the apparatus of life—such details as the position of doors in relation to the fireplaces, fireplaces in relation to the windows, provision in the bedrooms for a suitable position for the bed, windows that can be cleaned from the inside of the house and that do not require an external ladder periodically for this purpose. In the usual builders' cottages that help to swell the extension of buildings on the outskirts of a town or alongside a railway, these particulars are so generally ignored, that a tradition has almost grown up that such conveniences are not to be had in buildings of such cost. The Fallings Park houses will show that such demands are not impracticable, that a thoughtfully planned house will not consequently be a more expensive one to

build—whilst it will indubitably be a cheaper one to maintain.

"We think it well to point out that soft water should be stored in closed tanks, and preferably underground, with a pump to the sink in the scullery. The kitchens should be larger than the parlours, because the food wants to be cooked where it is going to be served, and there should be no range in the scullery or any inducement to try and make a kitchen of it. Many of the cooking ranges gave insufficient space for kettles and pots. It is better to have a boiler at the side fed by a ball cock than the 'sham' generally fixed. Coppers should be provided with a draw-off tap at bottom, and have hoods over them connected with the flue, to dispose of the steam.

"Mantelpieces of enamelled slate (such as were fixed in some houses) of pretentious size and design are unsuitable; and many of the cast-iron fireplaces were of poor design and supplied with insufficient fire lumps. The economical combustion of coal and the quantity of heat radiated therefrom, depend on the disposition of the fire lump back and sides, and no amount of florid iron work or pictured slate can compensate for a badly constructed grate. Where staircases open directly from a room, there should be a door at the foot, else the warmed air of the room escapes and is lost in the first floor passages and the roof; a staircase should not open from the scullery. It is a mistake to have hollow wood floors to the living rooms on ground floor; they require to be scrubbed, and the necessary ventilation beneath keeps them cold to the feet. To avoid the labour of scrubbing, they are generally covered with linoleum, and this inevitably produces in a short while decay of the boards from dry rot. It is better to form a layer of cement concrete on the ground and fix the linoleum direct to that. Shelves and dresser tops should not be painted, but the wood should be left plain.

"Regarding the permanent efficiency of the drainage as of as much consequence as the durable construction of the house itself—we consider the local public health authorities are content with a somewhat low standard in the matter of drains. It is perhaps too much to ask, even in a model housing scheme, that the drainage from the houses to the road sewer should be in iron pipes, but it is worth the Estate's consideration whether the larger first cost of a permanent system is not in the end an economy, and whether it is not its duty to insist that the community on the grounds of health shall ensure that every building shall be free from all reproach on that score, not merely at the outset, but permanently.

"We also consider that a 4½in. brick-nogged partition does not make a proper external wall, even though it be rough-casted—in fact, the impervious coat of rough-cast, whilst serving to exclude the weather, occasions the decay of the timbers forming the partition.

"In conclusion, we wish to express the pleasure it has given us to examine so interesting a collection of buildings, and so successful—speaking generally—an answer to the difficult problem of building cheaply and well."

The report is signed with the following names:—Halsey Ricardo, F.R.I.B.A., London (Chairman); Henry T. Hare, F.R.I.B.A., London; Detmar Blow, F.R.I.B.A., London; C. H. Barnsley, President of the National Federation of Building Trades Employers of Great Britain and Ireland; C. E. Bateman, F.R.I.B.A., nominated by Birmingham Architectural Association; Wm. Edwards, President of Wolverhampton Architectural Association; T. Medley and E. Medley, nominated by Trades Council; Kate P. Bantock (Mrs. A. Baldwin Bantock); and M. Evans, Mayoress of Wolverhampton.

The list of awards accompanying the report was given on p. 314 of our issue of October 21st.

Architectural Societies.

R.I.B.A.

The R.I.B.A. Kalendar for 1908-1909 has been issued, price half-a-crown, from 9, Conduit Street, Hanover Square, W. [An abstract of the paper read at last Monday's meeting appears on p. 389.]

Leeds and Yorkshire Architectural Society.

The forty-second report of the Leeds and Yorkshire Architectural Society shows that the total membership on April 30th of the present year was 166—namely, thirty-three honorary members, sixty-nine members, and sixty-four associates, as against a membership of 169 last year.

Northern Architectural Association.

The first quarterly meeting of the fiftieth session of the Northern Architectural Association was held at 6, Higham Place, Newcastle, on November 11th, when the president (Mr. G. T. Brown, F.R.I.B.A.) delivered the opening address, in which, in reference to the Housing and Town Planning Bill now before Parliament, he said that he considered the Bill a most complicated jumble, never saying definitely what was proposed, though the Bill generally should be productive of satisfactory results, as it must be admitted that the extension of towns ought not to be allowed to proceed on haphazard lines. One thing which might have been dealt with in the Bill, but which had not been included, was the valuation at which land could be purchased.

The Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.

At a meeting of this society, held in the Technical College recently, Mr. J. Campbell Reid, A.R.I.B.A. (president), in the chair, Professor Charles Gourlay, B.Sc., A.R.I.B.A., delivered a lecture on "An Architectural Tour in France." The district referred to lay eastwards of Paris as far as Nancy and in a north-eastern direction to St. Quentin. After a few remarks on the buildings of architectural importance in this area, the professor selected five of the ecclesiastical buildings referred to, for further study. In these he traced the development of French Gothic architecture from its Romanesque basis as seen in the church of Morienval, through the Early Gothic church of St. Remi at Rheims and Notre Dame at Chalons-sur-Marne to the later French Gothic as it is found in Notre Dame de l'Epine. Then he dealt in detail with Rheims Cathedral, which, on the grounds of simplicity of plan, singleness of purpose, and remarkable unity of expression, he considered to be one of the greatest of Gothic structures—probably the one in which perfection as a whole had been most nearly attained.

Birmingham Architectural Association.

The Green Book of this Association is in two respects notably different from the usual type of association year book in being more tastefully printed, and in containing, besides the usual information, five plates of architectural illustrations, namely, views of Santa Maria della Salute, Venice, and of the dome of St. Peter's, Rome, by Mr. G. Salway Nicol, A.R.I.B.A.; and three detail drawings of Wolvesey Palace, Winchester, by Mr. C. Russell Corfield. The programme for the session 1908-9 includes the following fixtures, an exceptionally interesting list: November 20, Mr. W. Curtis Green, A.R.I.B.A., on "Students' Studies"; December 11, Mr. Edward S. Prior, F.R.I.B.A., on "English Parish Churches, chiefly of the Fifteenth Century"; December 18, Sir Charles A. Nicholson, Bart., M.A., F.R.I.B.A., on "Churches of Northern France"; January 8, 1909, Mr. James B. Fulton, A.R.I.B.A., on "The Renaissance in Spain"; January 22, Mr. Arthur Dixon, M.A., on "Early Roman Churches"; February 5, Mr. J. A. Gotch, F.R.I.B.A., on "The Elizabethan House as illustrated by Contemporary Architectural Drawings"; February 19, Mr. Frank T. Baggalay, F.R.I.B.A., on "Roman Architecture"; March 5, Mr. C. H. Holden, A.R.I.B.A., on "Aboriginality in Architecture"; March 19, Mr. G. Salway Nicol, A.R.I.B.A., on "Rome and Paris—their Architectural Relations." The president of the association is Mr. J. L. Ball, and the secretary is Mr. E. Marston Rudland.

Liverpool Architectural Society.

Liverpool Architectural Society, which has just opened its sixty-first session, has arranged a decidedly strong programme of papers, which include the following: Mr. Reynolds Stephens on "Sculpture and its Relation to Architecture"; Mr. F. W. Troup, F.R.I.B.A., on "Ornamental Lead Work"; Mr. Lionel Thornley, F.R.I.B.A., on "Practice and its Pitfalls"; Mr. Mawson, on "The Gardens of the Peace Palace of the Hague"; Mr. Faulkner Shepherd, A.R.I.B.A., on "Competitions"; Mr. Mervyn Macartney, F.R.I.B.A., on "The Three Churches of St. Paul"; Mr. T. T. Rees, F.R.I.B.A., on "The Liability of Architects to Clients and Public"; and Mr. E. Guy Dawber, F.R.I.B.A., on "Materials and their Value in Relation to Domestic Architecture."

Architects' Benevolent Society.

Society of Architects' Appeal.—At the conclusion of his presidential address to the Society of Architects, on November 12th, Mr. Geo. E. Bond, J.P., earnestly called attention to the Architects' Benevolent Society. In times of depression, such as those through which we have been passing, he said, we have had ample evidence before us to prove that many of our less fortunate brethren have been reduced to the lowest ebbs of poverty and distress. The Benevolent Society is desirous of assisting such cases in a substantial manner, not by doles, but by putting them on their feet and helping them to secure employment. As representing the Architectural Association, Mr. Bond attended the last meeting of the Benevolent Society on October 23rd, when thirty applicants were dealt with, twenty-three being favourably considered and assisted, the total amount thus granted in relief being £212. Mr. Bond was much struck with the businesslike but sympathetic manner in which the cases were dealt with, and he strongly urged the members of his Society to do all in their power to assist the work.

Federation News.

MONTHLY REPORTS.

GREAT YARMOUTH MASTER BUILDERS' ASSOCIATION.

Secretary: R. J. Hill.

The number of members to date is 46. The twelfth annual meeting of the Great Yarmouth Association was held on Tuesday, November 3rd, at the Crown and Anchor Hotel, Hall Quay, Great Yarmouth. The chair was occupied by Mr. G. W. Beech, the president, who has held this position since the formation of the Association. He much regretted to see so few members present at the annual gathering, but no doubt the slackness of trade had a good deal to do with keeping the members from attending.

The Secretary stated that, in accordance with the rules, each member had been informed by post card a week beforehand,and also had a reminder the same morning of the annual meeting taking place. The yearly balance-sheet was presented, and owing to a falling off in subscriptions during the year, the expenditure had exceeded the income by a few pounds; but, considering the times, it was thought to be very favourable, and was passed.

The following officers were then re-elected: President, Mr. G. W. Beech; Vice-presidents, Mr. G. Chasteney and Mr. A. Jary; Auditors, Mr. B. Moore and Mr. B. G. Beech; Treasurer, Mr. J. Ward; Secretary, Mr. R. J. Hill, and eight other members to form the committee of management. Various papers were passed over from the National Federation, which were allowed to be put on one side, as they were very numerous. The following members were elected on the South-Eastern Centre Board of Conciliation: Mr. G. W. Beech and Mr. J. Chasteney, and Mr. A. Jary as substitute.

It was decided to subscribe to THE BUILDERS' JOURNAL.

It was thought advisable to call, at an early date, a committee for the purpose of going carefully through the rules to see whether any amendments were required, and to recommend them to a general meeting called for that purpose.

BRISTOL ASSOCIATION.

Secretary: A. J. Pitt.

The ordinary monthly meeting of the Bristol Association was held on Thursday, October 29th, under the presidency of Mr. Frank N. Cowlin. The report of the Contract Clauses Committee to the City Council, upon the question of the clause relating to the sub-contracts, was presented, recommending that the following clause be substituted for that now standing, viz.:—"The works shall not be assigned or sublet as a whole to any contractor, nor is any portion of the works to be sublet without permission in writing from the architect (or engineer, as the case may be), and then only to responsible parties approved by the architect (or engineer), and the fact of any sub-contractor being permitted by the architect (or engineer) to undertake portions of the works shall not relieve the contractor from the full and entire responsibility attaching to the contractor, including responsibility under the clause herein contained, with reference to the payment of wages and the observance of the hours and conditions of labour, nor from active superintendence of the works, either personally or by a qualified agent during their progress. Provided that if the contractor shall be required by the architect (or engineer), the corporation, or the specification to employ any particular sub-contractor, he shall not be responsible for work done or materials supplied by such sub-contractor, nor shall he be responsible to see that the clause relating to the payment of wages and the observance of the hours and conditions of labour is carried out with reference to the persons or workmen employed by such sub-contractor."

"For the purposes of this clause, a sub-contractor shall be deemed to include any person who, after the signing of the contract, prepares, with the permission of the architect (or engineer) specified work for the use of the contractor, in carrying out this contract, but it shall not be deemed to mean or include any person supplying materials to the contractor of ordinary stock sizes, or qualities, or which were not specifically prepared for use in this contract.

"Provided that the contractor shall be relieved of liability under this clause, if he prove to the architect (or engineer) that at the time of making the sub-contract he stipulated with sub-contractor for payment of the rate of wages generally accepted as current in the district in which the work he is executing is being done for a competent workman in his trade, and for the observance of the agreed hours and conditions of labour of the various trades in that district, subject to the like liquidated damages, and power to determine the sub-contract as provided for as regards this contract by Clause .... And provided that where called upon by the corporation, he take effective steps to enforce the conditions of his sub-contract."

Mr. A. Dowling reported that much attention had been given to this subject in the City Council, and the above clause had only been arrived at after much debate. The general feeling had been that it would be inadvisable and unfair to make the contractor responsible for matters over which he had absolutely no control, and the clause adopted, he considered, was as fair and equitable a one as they could expect. The president mentioned that the suggested clause submitted to the Trades Council by this Association, defining a sub-contractor, had been practically adopted, only a few alterations and additions having been made. The members present concurred in the opinion that the clause was a very fair one and would be generally acceptable to the trade.

A discussion ensued upon the question of sub-contracting, during which it was suggested that it would be well fully to consider the matter, with a view to some improvement in Clause 20 of the National Form of Contract, which it was felt would be more acceptable if modelled somewhat upon the lines of that just adopted by the City Council, and reported above. The committee were asked to give this subject their attention, with a view to a further discussion at the next meeting, and also to make enquiries as to whether there was in use, in any part of the country, a special form of contract for sub-contractors.

EDINBURGH, LEITH, AND DISTRICT BUILDING TRADES ASSOCIATION.

Secretary: James Cameron, Solicitor.

The monthly meeting of the executive was held in the Building Trades Exchange, 61, Lothian Road, Edinburgh, on Friday afternoon, October 30th. Mr. David McKie presided over a good attendance. One new member was proposed and admitted to membership, viz., Mr. John Cameron, blacksmith, 23, Richmond Place, Edinburgh.

Report on state of trade in the district showed it to be about the same as last month, but worse than last year at this time. There are prospects of an improvement, however. Rosyth Naval Base will probably in the near future give work to a large number of men, while the new cavalry barracks at Redford, Colinton, three miles from Edinburgh, will also give much needed relief.

A remit was made to the Master Plumbers' Committee to consider the position of the Edinburgh and Leith Gas Commissioners. They are doing the plumber work themselves for the alteration and extension of their premises at Waterloo Place. This is municipal trading of a flagrant type, and in their own interest the master plumbers of the city are moving in the matter.

With regard to the memorandum issued by the President of the Board of Trade, anent the proposed formation of a Court of Arbitration for the settlement of trade disputes, the meeting expressed itself as favourable to the proposal. It was agreed, in view of the importance of the matter, to call a special meeting of the Association on an early date, in order that each member may have an opportunity of stating his views.

PERTH ASSOCIATION.

Secretary: James Mitchell.

During the last few years, there has been little building of any importance in the City of Perth and District, and the master builders, joiners, and other tradesmen have felt the depression keenly. Prospects, however, are now somewhat brighter, and at the present moment the School Board is erecting a large school, known as the Northern District School; and the building of a new city hall, it is expected, will be commenced in a few weeks. There is also the prospect of a new infirmary being erected, but no definite arrangements have yet been made in this respect. A building of considerable importance belonging to the Co-operative Society, Perth, is in course of erection in York Place, and consists of shops and dwelling-houses. The Hammerman Tavern, with shops and houses above, is being re-erected in High Street. With these buildings in hand, and with other prospective work, the outlook for the building trade is brighter than it has been for some years. There is practically no speculative building in hand.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

The annual meeting of the Birmingham Master Builders' Association was held at the Grand Hotel, on November 10th, Mr. F. G. Whittall presiding. The committee, in presenting the annual report, regretted that they had to record that the building trade during the year had been in a very depressed state, and that there is at present no sign of a revival. The whole question of serving notices for a general reduction of wages had been fully discussed, and although reduction was justified by the stagnant state of trade it was decided not to reduce wages. A general meeting of the trade in April last approved of the inter-trading rule as in force in Liverpool. The balance-sheet showed that the total ordinary receipts for the year were £199 15s. 8d., which, with the balance from last year, made a total of £423 12s. 8d. The disbursements amounted to £397 12s. 1d., and the ballance to the credit of the association was £26 0s. 7d.—The report was adopted on the motion of the President, seconded by Mr. R. Bulley. On the motion of Mr. J. B. White, Mr. J. F. Whittall was re-elected president of the association for the fourth year in succession. The president, acknowledging his re-election, referred to the notices given to the operatives, and said that for the first time in the history of the association the notices served on the operatives were almost identical with the notices the operatives had served on the masters. While the association asked for a reduction of hours in order to bring the working hours into uniformity, the operatives had served notices for the same reduction of hours in order to provide employment for those who were at present out of work. He could not help thinking that it was a matter for gratitude and congratulation to the bricklayers that they were willing to sacrifice a very large part of what would be their weekly earnings for the purpose of assisting those of their members who were out of employment.

Mr. J. J. Moffatt was re-elected vice-president, Mr. George Twigg was re-appointed treasurer, and Mr. Ernest J. Bigwood was re-elected secretary. The committee were also re-elected, and the auditors (Messrs. J. S. Surman and Ralph Webb) were re-appointed.

The president, in accordance with the recommendations already approved at a special meeting, moved that the following addition be made to the rules of the association: "Members shall not give or take tenders for any work to, or from, any persons who are not members of this or kindred associations connected with the building trade, and shall not employ such persons to do work for them. The term kindred associations shall mean associations federated to the National Federation. That trade members be requested, wherever possible, in dealing with merchants or firms of a like nature, to give preference to honorary members of this association. That a similar telephone card to the one in use in Liverpool be adopted by this association." Mr. Albert Smith seconded the proposition, and after some discussion it was carried by nine votes to seven.

Mr. F. G. Whittall presided at the annual dinner which followed the business meeting. The function was largely attended, those present including the Lord Mayor of Birmingham (Councillor G. H. Kendrick), Mr. C. H. Barnsley (president, National Federation of Building Trade Employers), Lieutenant-Colonel John Barnsley, Messrs. J. Bowen, S. H. Rowbotham, A. G. White (secretary National Federation), W. Wistance (president, Midland Federation), F. W. Amphlet, (secretary, Midland Federation), J. L. Ball (president, Birmingham Architectural Association), E. J. Bigwood (secretary, Birmingham Association), and the presidents of the West Bromwich, Walsall, and Stourbridge Associations.

The Lord Mayor proposed "Success to the Birmingham Builders' Association and the Trade of the City."

The President of the Association responded to the toast. The other toasts honoured during the evening included "The Architects and Surveyors," proposed by Lieutenant-Colonel Barnsley, and acknowledged by Mr. J. L. Ball and Mr. Anthony Rowse, and "Kindred Associations," to which Mr C. H. Barnsley and Mr. A. G. White responded.

Trade and Craft.

MESSRS. MEASURES BROS.' NEW CATALOGUE.

The extent to which iron and steel pervade modern building construction is rather strikingly shown in the new "handbook" that has just been issued by Messrs. Measures Bros., Ltd., London and Croydon. Joists, girders, and stanchions are not the whole of the story; though these are described and illustrated, and their measurements and weights are carefully tabulated, with such completeness as to render the booklet really of high value as a work of reference on all points connected with structural ironwork. Lattice and steel-plate girders are treated with the same exhaustive thoroughness.

It is explained, perhaps not altogether superfluously, that the advantages to be derived from the use of solid steel columns instead of cast-iron columns or steel stanchions depend mainly on the superior strength of the former (e.g., a solid steel column, 9ins. in diameter, and 14ft. high, will carry 213 tons, whereas, to carry the same load, a cast-iron column would have to be about 16ins. in diameter, and a steel stanchion would have to be 15ins. by 18ins.), but there is the further gain that the solid steel columns offer much greater resistance to heat in case the building takes fire, and are far less likely to wreck the structure by twisting. It is hence advised that while a solid steel column is "theoretically expensive," the practical points in its favour outweigh the extra cost.

Flitched beams; angles, channels, and tees, and cast-iron and steel brackets of many varieties, are usefully illustrated; but these matters of detail are easily eclipsed in interest by the large section dealing with iron and steel roofs, which, it is stated—perhaps a little too modestly—are "gradually displacing timber as a material for roofs of large or even moderate dimensions." Many examples of steel trusses are figured and dimensioned with such care as to afford useful guidance as to choice of design or method of construction, and the details of struts, junctions, forked ends and eyes for tie-rods, and various cleated and other connections are given very fully.

Another large section is devoted to cast-iron columns, of which very many designs, plain and ornamental, are shown; and the enlarged details of ornamental column-heads include some really elegant designs, which lend an unexpected touch of beauty to a booklet in which uncompromising utility might well have been pardoned. Elegance of design is further seen, and is perhaps less surprising, in the section comprising ornamental gates and railings, etc., in which the splendid traditions of British ornamental wrought ironwork are well maintained, both in the general designs and in the greatly varied railing heads.

Several designs and details of iron buildings of various descriptions—churches, schools, and sheds—are illustrated with examples of Messrs. Measures Bros.' work in this kind. As the firm's activities are so multifarious, of which it may be assumed that this booklet is a faithful reflex, a mere list of the contents would occupy more space than we can afford; but it should be further mentioned that a section of special interest to builders and contractors is that in which various types of grinding mills for all purposes are described and displayed. Many full-page photo-process plates give interesting views of Messrs. Measures's various yards, foundries, operations, as well as of typical constructional work, completed or in progress, in which they have been engaged or for which they have supplied materials. Altogether, this catalogue is as interesting as it is useful, which is saying a great deal.

* * *

Cairn Mills, Silvertown, are to be partly reconstructed, under the superintendence of Mr. Bruce Dawson, A.R.I.B.A. Mr. William Downs is the contractor. The constructional steelwork is to be put up by Mark Fawcett and Company, of Westminster and Greenwich, and the fire-resisting floors are on the Fawcett system.

* * *

Visitors to Hickling Broad will find that the "Edwardian" chimney pot has travelled into this district, as these pots are to be seen on the Broad House.

* * *

The constructional steelwork, fire-resisting floors, and finishes to the warehouse additions, Stoney Street, Nottingham, and to the Nottingham Co-operative Society's extensions in Marple Street, Nottingham, were carried out by Messrs. Homan and Rodgers, Manchester; the architects being, respectively, Mr. W. H. Higginbottom and Mr. W. V. Betts.

* * *

We are informed that Messrs. Joseph Kaye and Sons, Ltd., of Leeds, and 93, High Holborn, London, who have already supplied more than 25,000 of their patent seamless serrated oil-cans to His Majesty's Navy, have again secured the contract from the Admiralty for the whole of the future supplies for the ensuing three years.

* * *

The Associated Portland Cement Manufacturers (1900), Ltd., of Portland House, Lloyds Avenue, Fenchurch Street, London, E.C., have issued an exceptionally well-produced pamphlet that includes an interesting sketch of the history of the cement trade, and is embellished with about thirty fine half-tone engravings of notable structures in which the firm's Portland cement has been used. These comprise the Houses of Parliament at Victoria, B.C., a reinforced concrete pier at J. B. White and Bros.' Swanscombe Works; the Nile Dam at Assouan; and the Barrage at Assiout; the London and North-Western Railway Docks at Garston; the Blackpool Esplanade; the new Cotton Exchange, Liverpool; the new Record Office; the Mersey Dock and Harbour Board Offices, Liverpool; Monroe Palace, Rio de Janeiro; the Ecclesiastical Commissioners' Building; the new War Office buildings; the new Tower Buildings, Liverpool; Pinkston Power Station; the Caledonian Railway Bridge; Birmingham Corporation Waterworks; Liverpool Technical School; Glasgow Bridge; the new Central Hall, Liverpool; and the Royal Liver Buildings, Liverpool. As the names of the architects, engineers, and contractors, accompany the views, the booklet is quite a little architectural album. The present firm, we infer, is a development of the first English firm of cement manufacturers, which was founded more than a century ago—in 1805, by Mr. John Bazley White. The firm now own the largest cement works in Europe. Architects should send for this booklet; they will find that it is worth having. The firm have also reprinted, separately in handy form, some "Notes on the Use of Concrete in Mines," and some useful memoranda on the same subject. This pamphlet also is well illustrated.

Insurance.

Subscribers to "The Builders' Journal" are entitled to a Free Insurance for £500. Every subscriber should apply for this, sending a postcard with the name of the newsagent with whom the order has been placed. Subscribers can also obtain a General Accident and Sickness Insurance (the "Lighthouse" policy) at a reduced premium, which includes the Annual Subscription to this Journal. A pamphlet giving full particulars can be obtained free on application.

Free £500 Accident Insurance Coupons have been sent to the following:—

The Manager, TECHNICAL JOURNALS, Ltd.,
Caxton House, Westminster, S.W.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Nov. 19-30. SANDHURST, Kent.—Erection of a new council school to accommodate 200 children at Sandhurst, Kent, for the Kent education committee. Plans and specification, prepared by Wilfrid H. Robinson, and conditions of contract, may be inspected at the offices of the committee, on or after Nov. 19, between 10 a.m. and 4 p.m. (Saturdays excepted). Persons desiring to tender and receive bills of quantities must send names, accompanied by deposit of £1, to the secretary, by noon on Nov. 19. Tenders, on the form supplied, must be enclosed in a sealed envelope, endorsed "Sandhurst Tender," and delivered by noon on Nov. 30, to Fras. W. Crook, secretary, Caxton House, Westminster, S.W.

Nov. 20. BANCHORY (Scotland).—Erection of a fire engine station at Banchory. Plan and specifications may be seen, and tenders should be lodged by Nov. 20, at the office of J. Merson, town clerk, High Street, Banchory.

Nov. 20. READING.—Erection of new buildings (limited to Berkshire builders), for the Berkshire education committee. Builders are requested to forward applications by Nov. 20, to The Education Secretary, The Forbury, Reading.

Nov. 21. ROGATE.—Erection of a detached dwelling-house at Fyning Common, within two miles of Rogate Station. Persons desirous of tendering are requested to apply to the architect, W. R. Howell, A.R.I.B.A., of 5, York Buildings, Adelphi, W.C., by Nov. 21.

Nov. 21. TRESADDERNE, Ruan Major.—Erection of a wain house at Tresadderne, in the parish of Ruan Major, in the occupation of S. H. Rowe, for the Right Hon. Viscount Falmouth. Persons desirous of tendering can inspect plans, conditions, and specification at the Farm House at Tresadderne. Tenders should be sent by Nov. 21, to George Gow, Tregothnan office, Truro.

Nov. 21. FROME (Somerset).—Additions and alterations at the Frome Milk Street council school for the county education committee. Plans and specification can be seen at the schools or at the offices of A. J. Pictor, Bruton, from whom any further information can be obtained. Sealed tenders, endorsed "Tenders, Frome Milk Street Council School," must be delivered at the county education office, Weston-super-Mare, by noon on Nov. 21.

Nov. 22. SEVEN SISTERS.—Erection of 16 dwelling-houses on Ynysdawly estate, Seven Sisters. Plans and specifications may be seen at Ynysdawly Farm. Endorsed tenders to be sent by Nov. 22, to John Williams, Stillau Gwynion, Seven Sisters, Neath.

Nov. 23. OVENDEN.—Execution of masons', joiners', concretors', asphalters', slaters', plumbers', painters', and steel and ironwork, in additions to works at Ovenden. Plans and specifications may be seen, and bills of quantities obtained, up to Nov. 23, of Joseph F. Walsh, F.S.I., and Graham Nicholas, F.R.I.B.A., architects, Museum Chambers, Halifax.

Nov. 23. YSTRADGYNLAIS.—Erection of an intermediate school at Ystradgynlais to accommodate 120 children, for the governors. Plans and specification may be seen and bills of quantities obtained at the offices of the architect, J. Cook Rees, Parade Chambers, Neath, on payment of £1 1s. Tenders to be sent, endorsed "Tender for Intermediate School," by Nov. 23, to L. J. Kempthorne, Duffryn Chambers, Neath.

Nov. 23. PENTREBACH (Wales).—Erection of shop premises at Taibach Lane, Pentrebach. Plans and specification may be seen at the office of T. Edmund Rees, architect and surveyor, Gernant, The Walk, Merthyr Tydfil. Sealed and endorsed tenders to be sent to G. King, 31, Bridge Street, Troedyrhiw, by Nov. 23.

Nov. 23-Dec. 3. ROWLEY REGIS.—Erection of a public elementary council school, for 310 boys at Doulton Road, The Knowle, Rowley Regis, for the U.D.C. £1 1s. for bills of quantities and form of tender must be sent to the secretary by Nov. 23. Plans, specification, and conditions will be open for inspection at the offices between 10 a.m. and 4 p.m. (Saturdays 10 a.m. to 1 p.m.), on and from Nov. 26, or can be seen with the architects, Pritchard and Pritchard, of Kidderminster. Tenders, duly endorsed, must be delivered by 10 a.m. on Dec. 9, to Daniel Wright, secretary to the committee, council offices, Old Hill, Staffordshire.

Nov. 24. LONDON.—Erection of dressing sheds at Hackney Marsh, for the L.C.C., to be built of wood framing, with concrete floors and tar paving, and covered with corrugated iron. Drawing and specification (without bills of quantities), form of tender, and other particulars at the architect's department, 19, Charing Cross Road, W.C., upon payment to the cashier, county hall, Spring Gardens, S.W., of 10s. Full particulars obtainable at 19, Charing Cross Road, before payment of fee. Tenders to be delivered marked "Hackney Marsh Dressing-Sheds," by Nov. 24, to G. L. Gomme, clerk of the L.C.C., County Hall, Spring Gardens, S.W. Fair wages clause.

Sealed tenders, endorsed "Tender for Granite," or "Quartzite," to be delivered by Nov. 23, to Herbert J. Thompson, clerk to the council, U.D.C. offices, Sevenoaks.

Nov. 23. BROADSTAIRS.—Supplying and laying 1,255 superficial yards or thereabouts of limestone tar paving, at Stone Road, within the district, for the Broadstairs and St. Peter's U.D.C., in accordance with plan and specification prepared by the town surveyor, Howard Hurd, C.E., which can be seen at his office, and particulars and form of tender obtained. Tenders, endorsed "Tender for Tar Paving," to be delivered at the office of Lionel A. Skinner, clerk, council offices, Broadstairs, by noon on November 23. The contractor will be required to enter into a bond, with two sureties, for the performance of contract.

Nov. 23. DERBY.—Making up and completing the carriageways and footways of the following private streets, for the corporation:—Almond Street (part), and Stanton Street (part). Plans and specifications may be seen and bills of quantities and further particulars obtained on application to John Ward, borough surveyor, Babington Lane, Derby. Tenders, endorsed "Tenders for Completion of Private Streets," to be sent by 9 a.m. on Nov. 23, to G. Trevelyan Lee, town clerk, town clerk's office, 15, Tenant Street, Derby.

Nov. 23. HESTON AND ISLEWORTH.—Execution of the following works, for the U.D.C.:—1, Making-up Gordon Avenue, St. Margarets; 2, Hospital Road, Hounslow. Plans, sections, and specifications may be seen, and bills of quantities and form of tender obtained, from J. G. Carey, engineer and surveyor to the council, council house, Hounslow, on payment of one guinea. Sealed tenders, on form provided, endorsed "Private Street Works, Gordon Avenue," or as the case may be, must be delivered by noon on November 23, to H. J. Baker, clerk to the council, council house, Hounslow.

Nov. 24. BOOTLE.—Supplying granite paving materials, for the corporation. Forms of tender may be obtained at the office of B. J. Wolfenden, A.M.I.C.E., borough engineer, town hall. Tenders to be sent, endorsed "Tender for Granite Paving Materials," by 10 a.m. on Nov. 24, to J. Henry Farmer, town clerk, town clerk's office.

Nov. 24. LEATHERHEAD.—Making up Magazine Place, for the U.D.C. Plan may be seen, and specification, schedule of prices, and form of tender obtained from the office of J. E. Smales, surveyor, council offices, Leatherhead, upon deposit of one guinea. Sealed tenders, endorsed "Tenders for Making up Magazine Place," must be delivered to the clerk, council offices, by 5 p.m. on Nov. 24.

Nov. 24. SOUTHAMPTON.—Laying asphalte paving in the roadway of the Strand, for the corporation. Plan and specification may be inspected and form of tender obtained at the borough engineer's office upon production of the borough treasurer's receipt for £1 1s. Tenders on prescribed form, endorsed "Tender for Paving Strand," must be delivered before 2 p.m. on Nov. 24, to R. R. Linthorne, town clerk, town clerk's office, municipal offices, Southampton. Every tender must be accompanied by the borough treasurer's receipt for £10 (Bank of England note).

Nov. 25. HAMMERSMITH.—Making-up and paving Emlyn Road (part of), for the corporation. Plans and specification may be seen and forms of tender obtained on application to H. Mair, borough surveyor. Sealed tenders, endorsed "Tender for Paving Work," must be delivered by 6 p.m. on Nov. 25, to H. Thompson, town clerk, town hall, Broadway, Hammersmith, W.

Nov. 25. WOOD GREEN.—Making-up the following private streets, for the U.D.C.:—(1) Dunbar Road (Section I.); (2) Ampthill Road; (3) passageway at rear of Nos. 103-133, High Road; (4) Alexandra Park Road (Section III.); and (5) Woodside Road (Section III.), all within the urban district. Plans, sections, and specifications may be seen, and bills of quantities obtained, on application to the surveyor, town hall, Wood Green, upon deposit of one guinea, with the clerk. Sealed tenders (upon forms supplied to be delivered by 5 p.m. on November 25th, to Mm. P. Harding, clerk of the council, town hall, Wood Green. The contractor will be required to enter into a contract for the execution of works, and a bond (with two approved sureties) for its due performance; also to employ local labour as far as practicable. Fair wages clause.

Nov. 26. BIRMINGHAM.—Supplying road material, broken and unbroken, delivered at railway stations and wharves in the county, for the Warwickshire C.C. Sealed tenders on forms obtainable from the county surveyor, addressed "Tenders for Road Material," must be delivered by Nov. 26, to John Willmot, county surveyor, Birmingham.

Nov. 26. OTLEY.—Sewering, levelling, paving, kerbing, channelling, flagging, and macadamising Manor Street, for the U.D.C. Specifications and general conditions may be seen and quantities obtained on payment of one guinea at the engineer and surveyor's office, council offices, Otley. Sealed tenders to be sent to the council offices, Otley, addressed to the chairman of the highways committee, by noon on Nov. 26.

Nov. 30. PENGE.—Execution of private street works in Cottingham and Torr Roads, within the district, for the U.D.C. Plans and specifications may be seen, and copies of bills of quantities with forms of tender obtained, on application to Herbert William Longdin, surveyor, town hall, Anerley, S.E., on payment of two guineas. Sealed tenders, accompanied by priced quantities, endorsed "Tender for Roadmaking," to be delivered by noon on Nov. 30, to C. W. Dommett, clerk to the council, town hall, Anerley, S.E.

MISCELLANEOUS.

Nov. 23. GRAVESEND.—Redecorations at King Street schools, for the education committee. Specifications to be seen at the office of the borough surveyor, town hall. Tenders to be delivered by Nov. 23.

Nov. 24. YSTRAD RHONDDA.—General repairs, to be done at observation block, discharging block, mortuary, administrative block, two pavilions, etc., of the isolation hospital, Ystrad Rhondda, for the U.D.C. Plans, etc., may be seen, and tender forms obtained, at the office of the architect, W. D. Morgan, 194, Ystrad Road, Pentre, upon the production of a receipt from the accountant of the council for deposit of £1 1s.

No date. USWORTH.—Concreting engine house foundations. Persons desirous of tendering should apply for particulars to the engineer, Usworth Colliery.

THE

Federated Employers' Insurance Association, Ltd.

HEAD OFFICES:

30, Cross Street, MANCHESTER.

Non-Tariff—Founded by Builders.

THIS ASSOCIATION GUARANTEES THE DUE PERFORMANCE OF CONTRACTS and invites enquiries from Contractors in matters incident thereto. Negotiations tend to prompt and effective arrangements.

BUILDERS' RISKS so far as WORKMEN'S COMPENSATION AND PUBLIC LIABILITY are concerned form special features in connection with the Association's operations. Moderate Rates and equitable conditions apply.

FIRE, PERSONAL ACCIDENT AND ILLNESS, and miscellaneous Insurances are transacted.

Submit enquiries.

Federation Secretaries are invited to apply for an Agency.

GEO. L. DREW,

General Manager and Secretary.

Telephone: 5948 Manchester.
Telegraph, "Federated," Manchester.

Appointments Wanted.

The charge for Advertisements under this heading 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ARCHITECT'S Assistant, 25, silver medallist, for town planning (see "Journal" Oct. 14, page 290); 8 years' experience, designs, details, specifications, measuring up, and estate development, surveys, levels, etc.; excellent references; moderate salary.—Gilbert Waterhouse, Park House, Buckhurst Hill. 4696

ARCHITECT'S Assistant seeks engagement; has had nine years' experience in good offices (London and the provinces); just completing engagement with City firm; excellent testimonials; moderate salary.—Box 4636, BUILDERS' JOURNAL Office.

ARCHITECT'S junior assistant (21), 5 years' church and domestic experience in busy provincial office; surveying and levelling; excellent references; moderate salary.— Box 4645, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant, age 27, desires engagement, permanency preferred; good draughtsman, and capable at working drawings, details, perspectives, water-colour, and pen and ink, assistance with specifications, quantities and general work, levelling and survey; salary 30s.—Apply Aubrey Leonard Pritchard, Bryn Derwen, Rhyl, North Wales. 4709

ARCHITECTS', builders', estate agents', assistant, 10, working drawings, colouring, etc.; energetic draughtsman, assist in office work; good references from architect.—F., c/o C. J. Williams, 89, Shrubland Street, Leamington Spa. 4708

ARCHITECT and surveyor's junior assistant desires situation; 4 years' experience; good draughtsman, plot from sketches; certificates, building construction; also shorthand (100) and typewriting; good testimonials; energetic; would go on trial; age 19; salary £1. — Box 4674, BUILDERS' JOURNAL Office.

A COMPETENT Architectural Assistant (22) seeks appointment; excellent testimonials and hon. certificates. Open to take place with surveyor, estate agent, sanitary engineer, etc. Salary, 30s.—Apply Box No. 4688, BUILDERS' JOURNAL Office.

ARCHITECT'S junior assistant, ten years' varied London experience, references, 35s., or by arrangement; churches, domestic alterations, measuring; London, Provinces.—Dicken, 8, Westbury Road, Ealing. 4650

ARCHITECTURAL Improver, or junior assistant (21), excellent knowledge in good design, very neat and clever draughtsman; assist quantities, surveying, perspectives; moderate salary; specimens.—Box 4635, BUILDERS' JOURNAL Office.

ASSISTANT, A.R.I.B.A. (29), thirteen years' London experience, working drawings, perspectives, specifications, supervision; office work; well up in management; salary 2 guineas; London preferred.—Apply Box 4622, BUILDERS' JOURNAL Office.

ARCHITECT'S assistant (23), over 7 years' London and Provincial experience; excellent references; Inter.R.I.B.A. Exam. — H. J. Wilson, "Brinkdale," Park Road, Peterborough. 4670

ARCHITECT and Surveyor's Assistant (24); 8 years' London exp.; working drawings, specifications, superintendence, prizeman and medallist, testimonials; mod. sal.—W., 20, Holmewood Road, Streatham Hill, S.W. 4669

ARCHITECT and surveyor's junr. assistant; 5½ years' experience; working and detail drawings; levelling, perspectives, specifications; assist quantities; excellent testimonials; moderate salary.—Box 4546, BUILDERS' JOURNAL Office.

ARCHITECT and Surveyor's junior assistant desires engagement; probationer R.I.B.A.; good draughtsman; 4½ yrs.' general exp; moderate salary.—F. G. C., 46, Franklin Road, Gillingham, Kent. 4641

ARCHITECT'S and Surveyor's Assistant desires change; 6 years' varied general experience; assist quantities, good refs.—Box 4617, BUILDERS' JOURNAL Office.

ARCHITECT'S and Surveyor's Assistant, 15 years' good practical experience; excellent draughtsman, designer, and colourist; working drawings, details, specifications, surveying, levelling and general routine; excellent references; moderate salary.—A. R., 1, Ivy Villas, Cheam, Surrey. 4698

ARCHITECT'S Junior Assistant, over 4 years' London experience, competition work, contract drawings, details, perspective; honours construction, Prelim. R.I.B.A.; very moderate salary.—Box 4661, BUILDERS' JOURNAL Office.

ARCHITECT'S son, 10 years' office experience, wishes to take up agency or post as representative in Lancashire, or North of England, to well-known firm in any special line of Building trade.—Apply Box 4585, BUILDERS' JOURNAL Office.

AS Clerk, cashier, depot manager, or any position of trust, 11 years' experience, builder's and coal merchant's trade; age 25; good penman; also reference; moderate salary.—Box 4659, BUILDERS' JOURNAL Office.

BUILDER'S or surveyor's assistant (20), 4 years with quantity surveyor; quantities, estimating, correspondence, plans, tracings, measuring up, levelling, etc.—H. Priddle, 4, Sumatra Road, West Hampstead, N.W. 4705

BUILDER'S general foreman, advertiser seeks engagement; 16 years' service as above with first-class London firm on important and various works; good references.—Address H., 150, Effra Road, Wimbledon, S.W. 4703

BUILDER'S and Surveyor's Assistant (24), practical experience in construction and surveying; also quantities and levelling, supervision; assist estimating; draughtsman; well up in costs, accounts, wages, etc.; moderate salary.—Box 4684, BUILDERS' JOURNAL Office.

BUILDER'S Assistant desires situation; age 23; thorough office routine; can take charge; experienced in estimating; quantities; accounts; p.c. invoices; good draughtsman; moderate salary.—F. Webber, Cranfurd Rise, Maidenhead. 4701

BUILDER'S general foreman desires re-engagement; just finished large schools; town or country; thirty years' experience; thoroughly practical in all branches; good manager; steady and reliable. First-class testimonials.—W. R., 85, Grove Lane, Handsworth, Birmingham. 4702

BUILDER'S Assistant disengaged, 21 years' experience; office routine, plans, specifications, quantities, supervision, measuring up, levelling, and surveying; good references; abstainer.—L. J. Greaves, Prestwood, Great Missenden, Bucks. 4717

BUILDER'S foreman, with good London experience of all trades, seeks position of trust; estate or business firm; correspondence invited.—Box 4716, BUILDERS' JOURNAL Office.

CLERK of Works, 16 years' experience, supervision and management of important buildings in London and country, well up in details, special knowledge of ecclesiastical buildings. — T. B., Box 4603, BUILDERS' JOURNAL Office.

CARPENTER and Joiner (age 32) wants job. Bench, fixing, alterations, or jobbing. Could take charge if required. Good references. Life abstainer.—Pearson, 53, Hartham Road, Isleworth, W. 4681

DOMESTIC Engineer, young, energetic, thoroughly practical, seeks sit as estimating or working foreman, used to taking charge; large heating and sanitary, installation; good refs.—Box 4707, BUILDERS' JOURNAL Office.

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, BUILDERS' JOURNAL Office.

ENGINEER, general, wants permanent appointment, official or private staff; thorough all-round experience; electrical, plumbing, smith, married, 34; good testimonials.—86, Bathurst Gardens, Willesden. 4704

GENERAL Foreman, 30 years' experience; man of ability; good references.—Foreman, 200, Francis Road, Leyton, N.E. 4685

GENERAL foreman, shortly disengaged, just completing large schools in North Stafford; abstainer; age 34; 12 years management of men.—Burchall, Crow Lane, Earlestown, Lancs. 4666

GENERAL foreman, disengaged, thoroughly practical and reliable; 20 years' experience; new or alterations; first-class reference.—F. C., 3, Crewdson Road, Brixton, S.W. 4668

GENERAL Foreman shortly disengaged, just finishing large job; town or country; thirty years' experience; thoroughly practical in all branches; good manager; steady and reliable; first-class testimonials.—W. R., New Council Schools, Biddulph Moor, Congleton. 4621

HIGH-CLASS decorator, manager, seeks re-engagement; estimator for all classes of best work; abroad if necessary; excellent testimonials; moderate salary.—Apply Forbes, 7, Eldon Street, York. 4677

IMPROVER, brass-finisher, etc., requires situation, 3 years' varied experience with well-known London firm; energetic, steady, and reliable; first-class testimonials. Abstainer. — Apply Box 4550, BUILDERS' JOURNAL Office.

JUNIOR Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, BUILDERS' JOURNAL Office.

PLUMBER (26), abstainer, well up in all sanitary or lead-laying; will do piecework; town or country. Can do zinc and hot water.—W. E. B., School House, Muriel Street, Barnsbury, N. 4615

PLUMBER (Reg. by Exam.), well up in hot water and heating systems, capable of taking entire charge; 6 years' ref.; age 38.—H. P., 11, New Buildings, Hampstead, London. 4676

PLUMBER (aged 30); gas and hot water fitter; well up all branches, new or jobbing; wages mod. Town or country.—11, Glaskin Road, Hackney. 4690

QUANTITY Surveyor, London, first-class experience, and qualifications, wishes to arrange with architects or others for preparation of bills of quantities, adjustment of variations, etc.—Box 4675, BUILDERS' JOURNAL Office.

QUANTITY Surveyors.—A builder wishes to place his son (18) in above office; has had some experience. No premium, but can introduce business.—Apply H., Ashford House, Wimbledon Common. 4686

QUANTITY Surveyor, Member Q.S.A., 32, eight years' practical building experience, eight years' office practice, desires post as senior or managing assistant.—Box 4610, BUILDERS' JOURNAL Office.

SLATE MERCHANTS AND BUILDERS' MERCHANTS.—Experienced traveller (with 14 years' connection Midlands), desires re-engagement; at liberty middle of December; or could arrange earlier.—Address, Slate, c/o Secretary, Builders' Exchange, Sheffield. 4624

The Sense of Taste in Art.

Mr. Felix Clay's paper—recently delivered before the Architectural Association and reported in the last issue of this journal—reminds us of a time-honoured and much discussed controversial question inseparably connected with his interesting subject, "The Origin of the Sense of Taste." We allude to the *causes* which resulted in the artistic supremacy of the ancient Greeks and enabled them to produce those marvellous temples, public monuments, and other works, some of which are still appropriate object-lessons of the refined and elevated taste and genius and public spirit of a people whose achievements in the world of art have probably very rarely been equalled and certainly never surpassed in excellence. Why, to put it briefly, were the minds of the inhabitants of Greece so susceptible to beauty in its highest aspect—ideal beauty as it is, not inaptly, called—that their selection of what was most suitable for imitation ultimately caused them to reject the mechanical and conventional art of other nations, hitherto almost exclusively employed for monumental or religious objects, and led to the great development of architecture and sculpture which, in their hands, became splendid illustrations either of elevated thought or of the physical perfection of the noblest work of nature? Valuable as are the artistic remains still left to us by time, of other and more ancient nations, it was by the Greek mind alone that the full æsthetic significance of the art of design was first recognised and appreciated. Consider the immense period of time covered by the age when the Greeks were content to produce sculpture in which, as in Egyptian and other art, all movement and individuality were excluded. Then regard the advances made in the successive periods of Greek art (1) 900—700 B.C. (2) 700—480 B.C. (3) 480—400 B.C.—the latter period being the age of the great early masters of sculpture—Myron, Phidias, and Polycleitus. It was not until the sixth century that the genius of the Greeks, then entirely liberated from the fetters of tradition, passed beyond the limitations of art within which, up to that time, all nations had been content, and inaugurated, in each and all of its varying phases of conception, composition, and execution, that universal cult of beauty with which the art of Greece will be for ever associated. Why, unlike other nations, were the Greeks thus enabled, in the golden age of their national existence, to set aside tradition and convention and thus enable the productions of the architect and sculptor to be raised to the level of the fine arts? Various reasons have been assigned by many writers—some of whom have endeavoured to account for the artistic superiority of the Greeks by attributing it (1) to their climate, (2) to the conditions of their national government, or (3) to the fine physical development of the people. But, as Professor Westmacott long ago pointed out, "none of these influences existed universally in any of the localities where sculpture was most successfully practised, and neither of them singly was sufficient to produce the effect attributed to it." The love of beauty could not have been inherent in the nation, because sculpture, among the ancient settlers in Greece, did not differ, to any appreciable extent, from that of other countries in which the art was practised. As to (1) climatic influence, Attica, which was more especially renowned for fostering the fine arts, had a soil of great inequality, part being very fertile, part bare and barren. Nor can the form of government (2) account in any way for the excellence and extent of the art products of ancient Greece, because, in the cities in which art chiefly flourished, viz., Athens, Corinth, and Sicyon, both the political and social conditions of the people were widely divergent, and with regard to (3), whilst the Athenians were certainly distinguished for the surpassing excellence and beauty of their sculpture, yet with regard to their personal comeliness they were not a whit superior to the inhabitants of other parts of Greece. Indeed, in this connection, it is worthy of remark that Cicero, speaking of the youths he saw in his day at Athens, observes that "but few of them were handsome." It therefore seems to be established, with some certainty, that the causes which were instrumental in enabling the Greeks, as a nation, to excel in the fine arts, are to be looked for elsewhere. But however brought about, there is no doubt the Greeks, during the best period of their art, acquired a sense of the appreciation of the beautiful, and thereby established a principle upon which the work of their sculptors was founded and, in the main, was the chief cause of its excellence. This principle was the recognition of sculpture as an *imitative* art, and resulted in an artistic supremacy which in due course led the Hellenic sculptor to discard the *symbolical* art of his own and other nations and enabled his unerring instinct to select that which was most fit to be imitated, and thus it was that Greek sculpture, at its best, reached the state of perfection with which we are accustomed to associate the plastic art of that nation. The possession by the Greeks of a mysterious intuitive faculty which enabled them to appreciate true beauty, in all its varied aspects, is shown in many ways. For instance, their priests were sometimes selected from among the handsomest youths available for the office, whilst artists were, occasionally, fined or otherwise punished for shocking public sensibility by the representation of such repulsive subjects as the distortion of the human body of any abnormal facial expression at variance with the established canons of beauty. The Gymnasia, or schools of physical training, were largely instrumental in causing all classes of the community to become expert judges of the human form, whilst the inauguration of public games and athletic contests, in which the competitors appeared in a state of nudity, was of great assistance to Greek sculptors in their efforts to acquire an intimate knowledge of the anatomy of the human body, which they were thus able to constantly study under almost every conceivable condition of movement or pose. As might be expected, so perfect a system of art education did not fail to make its influence felt, and the result is apparent in the fine modelling and anatomical correctness of form displayed in the best examples of Grecian sculpture in an age in which architect and sculptor worked hand in hand. As the art of the latter was developed, stage by stage, that of the former was conterminous with it. Both gained by the union, and simultaneously attained that extraordinary excellence which enabled them to maintain their unrivalled superiority through so many epochs of art and constant mutations of style. Undoubtedly the progress and development of Greek art was largely due to the fact that it did not owe its main support to the artistic idiosyncrasies and personal taste of a few rich citizens, but, on the contrary, the more important works of the architect and sculptor were produced to delight an appreciative public, mainly composed of persons who, if they were not artists themselves, were at least keenly alive to the moral and intellectual advantages of the cult of beauty. Thus no sordid personal motives were introduced to limit the artist's choice of subjects, or otherwise

hamper him in the conception and execution of his work. His duty to the public was to produce artistic records of noble actions—to erect stately temples dedicated to the immortal gods—to model and carve representations of divinities, heroes, and public benefactors. The Greek architect or sculptor working amid such ideal conditions and environments, his productions were received by the public with an amount of enthusiastic appreciation which has no parallel in the history of art, and the artists thus wisely encouraged by an art-loving community to a spirit of honourable emulation, were not slow to respond, but inspired by genius and knowledge, gave freely of their best. Hence, the stately memorials of the golden age of Hellenic art were *primarily* due to the wise patronage of a far-sighted people, the result of whose appreciation of beautv is to be seen to this day, in the remains of some of the noblest architectural memorials known to the world.

Figured Marble.

Tinos marble — dark green, with white and violet veining—is undoubtedly a most desirable variety. On the Continent, it is, we are informed, extensively used for furniture tops, as well as for decorative work, while in the United Kingdom and in America it is largely employed for columns and pilasters. Obviously it is, as it deserves to be, very popular; yet the demand for it is not yet so stupendous as a certain consular report has made it appear. By that showing, London, during 1907, imported 69,276 tons of this beautiful stone; New York, 70,359 tons; Hamburg, 222,342 tons; Antwerp, 230,313 tons; Bombay, 297 tons. Tinos marble, however, being as yet too precious to squander on street-paving works, and the boom in palatial poor-houses having incontinently collapsed, it occurred to an esteemed correspondent of ours, who is keenly interested in the subject, to challenge this colossal export. The event shows that he was fully justified of his inquisition. The heretic convicted—or the scapegoat sacrificed—was, of course, the printer, who is alleged to have wrested the scriptures to his own condemnation. Nevertheless, we take leave to suspect the purity of text of the consular manuscript. It is alleged, however, that the printer substituted commas for decimal points in the midst of the figures, thus vastly exaggerating their import——and their export value. This simple but effective expedient need not be brought to the notice of political statisticians; it is probably one of the most familiar recipes in their cookery books. But the culinary process of dealing with raw materials seems to be beneath the dignity of a Consular Report. Precisely why the matter has been introduced to our notice is not quite clear. Perhaps our correspondent is justly proud (we trust that he is not inordinately vain) of his success in establishing his decimal point.

The International Congress of Builders.

The second international congress of the building industry and of public works, which was opened on Monday week, and lasted four days, was apparently as successful as could be expected. The value of such congresses may be assessed by various standards. As to whether a congress is successful in itself can be judged immediately, but its after-effects can only be estimated very roughly. This particular congress seems to have passed the first test very satisfactorily. The speaking was unusually good, the debates gave rise to no unpleasant incident, the visits to works in progress were extremely interesting—especially to the foreign visitors, who, moreover, were specially entertained at *une grande soirée de gala* at the Marigny Theatre—and a grand climax was reached in a brilliant banquet at the Hotel Continental. As to the business transactions, and the possibility of future developments thence arising, we shall perhaps be in a better position to judge from the report for which arrangements have been made with an English visitor to the congress. In the meantime, such accounts as we have read in the French newspapers do not suggest richness of promise. Little, if any, fresh light seems to have been shed on such perennial problems as the pricing of quantities, the limitation of hours of work, the decay of apprenticeship, the improvement of technical education, legislation as to accidents, arbitration in disputes, etc., and no fresh subject seems to have been introduced, and no new principle was enunciated. Still, an international congress has its uses, and our correspondent's impressions are awaited with interest.

Brighton and Margate.

Brighton's ambitious scheme for the erection of an immense casino, kursaal, or winter palace on the front has been abandoned, at all events, temporarily, the promoters having withdrawn in deference to strong local opposition. This fiasco seems rather to encourage than to dismay the promoters of the Margate kursaal scheme, in furtherance of which the corporation has applied for sanction to borrow £16,000 for the purchase of a site. At the Local Government enquiry with regard to this loan, there was but little opposition. It may therefore be assumed that Brighton's failure is regarded as Margate's opportunity, and that we shall yet see a bold—perhaps an over-bold, experiment in palatial pavilions. But, in either case, the gain or loss to architecture properly so-called is not likely to be appreciable. The casino and pavilion style is usually abominable.

The Victoria and Albert Museum.

The report of the Committee of Rearrangement of the Victoria and Albert Museum at South Kensington, published last Saturday as a parliamentary paper, emphasises once more the peculiar difficulties of the architect who is engaged to do work for the Government. The planning of the Museum, it seems, might have been better adapted to the requirements of the Museum, if only Sir Aston Webb had received the advice and assistance that he was entitled to expect from the authorities. Architecturally, the interior, with its long vistas and its dignified courts and galleries, is undoubtedly very fine; but it is now complained that the planning is of such a character as to make it difficult to show certain of the contents to the best advantage. Some of the defects—such as the massing together of the staff offices, so that many of the keepers would find themselves at a very inconvenient distance from their collections—can be and are being, easily remedied; but there are instances in which, it is said, the space could have been much more economically used if the architect had been properly instructed at the outset. But let it be clearly understood that, as a writer in the "Times" has remarked, "Most of the merits of this great and costly building are Sir Aston's own; its faults are those of the department which failed to form a clear idea at the outset of what the functions and organisations were to be, and to instruct their architect accordingly." The authorities, instead of appointing a travelling commission to ascertain the best that was being done in museum planning, appear to have left the architect to his own devices; and in the circumstances, the only wonder is that he has done so well.

Why a Rod?

Why a "rod" of brickwork?—A correspondent of "Notes and Queries" has raised this harassing question. He points out that in England brickwork is measured by the rod, a rod being the amount of brickwork measuring 16½ft. in length, by 16½ft. in height, by 1½ft. in thickness. He adds that the rod is used in Sir Christopher Wren's contracts for the building of Greenwich Hospital so that it has been a long time in use. He wants to know why the rod or perch, which is a land measure, is used for measuring brickwork, and when the use of this method of measuring brickwork was first introduced. Perhaps some of our learned readers can answer these questions; in which, we will confess, there is one point that piques our curiosity. How is it that the querist is able to state so confidently that the rod is a land measure adapted to brickwork? The answer to his questions might conceivably show that the rod is a brick measure, adapted to land.

Apologia for Skyscrapers.

The skyscraper has its apologists, even in England. A writer in the "Spectator" invests them with architectural possibilities. While admitting that "many of the lankest of these buildings are beyond a doubt basely and irretrievably utilitarian," he recognises that "from the beginning there were architects who perceived that skyscrapers were inevitable, and who set to work to design the most scientific and architecturally the most noble buildings which the circumstances permitted." Taste is to undergo a considerable evolution, and the much-abused skyscraper is to be praised as a characteristic product of the American genius. But it is to be a different kind of skyscraper, and is to have "a very distinct majesty of its own. An office building a hundred storeys high is predicted by an enthusiastic American; but they are to present a variegated skyline, no façade rising more than 100ft. above the street, while the height of the towers is apparently to be limitless. As the writer in the "Spectator" puts it—quite poetically—"The dead skyline of the future city will not rise extravagantly high, but above it, like particular peaks upon a chain of mountains, will be towers and domes and pinnacles, through which the sun may shine and the breezes blow. . . . And then, of course, this style of architecture will be imitated all over the wold." New York will not stand alone as "the City of Dreadful Height." Then "it is not beyond the bounds of imagination that light bridges will be thrown across from building to building, say at the middle and high levels. The towns would then be interlaced like the masts of a ship with rigging." Monstrous pretty, indeed!

THE CHURCH OF SANTA SOPHIA, CONSTANTINOPLE.*

By J. B. FULTON, A.R.I.B.A.

Santa Sophia means a concrete representation of Holy Wisdom, an abstraction denoting the All-Wise, or the idea of Christlike wisdom. Many Greek churches are dedicated to it, the most famous being that at Constantinople, built by Justinian V., 532—537 A.D. (5 years, 10 months). Justinian was a great builder, and he spent large sums in buildings. The Church of Santa Sophia (now a mosque) was erected by him.

"The World's Greatest Architect."

Anthemius, the greatest architect the world has ever known, and who about the beginning of Justinian's reign settled in Constantinople, after travelling over the Empire in search of the noble and beautiful, had studied the ancient temples at Ephesus, the Roman cities in Syria, and the noble Parthenon, and had visited the capital of Ancient Rome, and beheld in wonder mixed with sympathy and knowledge the baths of Caracalla, Diocletian, the Pantheon, etc. On his return to Constantinople, the capital of his native country, he designed and built SS. Sergius and Bacchus, the interior of which so impressed the Emperor that he ordered Anthemius to design and build the new church of Santa Sophia, the old church having been destroyed by fire. He desired the genius of the Empire to build something greater than St. John's at Ephesus or SS. Sergius and Bacchus at Constantinople.

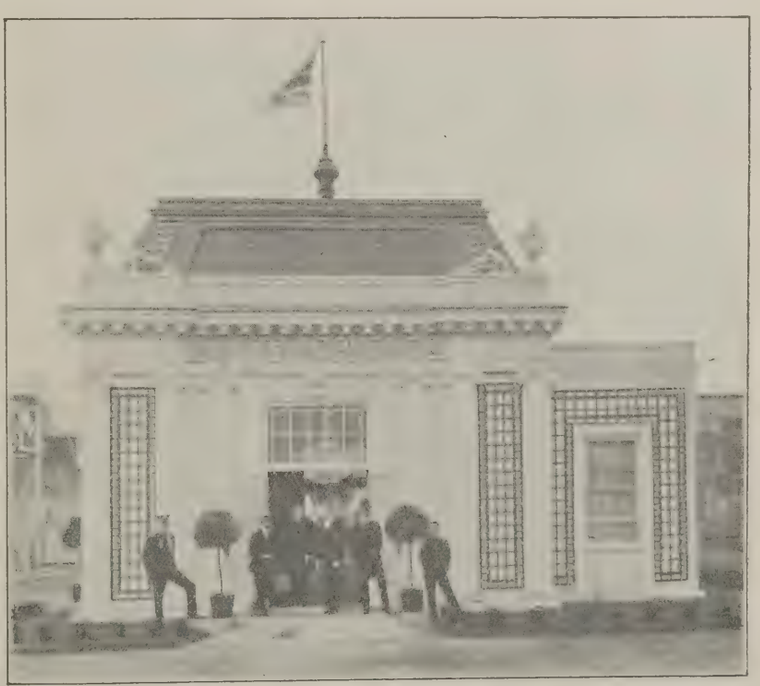
The Emperor, thinking not of cost of any kind, pressed on the work, and collected together workmen from every land. Anthemius of Tralles, the most skilled in the builder's art, not only of his own, but of all former times, carried forward the Emperor's zealous intentions, organised the labours of the workmen, and prepared models of the future construction. Associated with him was another architect, named Isidorus, a Milesian by birth, a man of intelligence, and worthy to carry out the plans of the Emperor. Anthemius was asked to design and build a church to surpass all previous works. His brain was fertile, he thought of the severe lines of the Greek temples, and the freer forms of the Romans. His materials, his craftsmen, all had to be considered. The mighty buildings of the Egyptians were familiar to him, the Temple at Jerusalem; but what had impressed him more than all else were the great Roman arches of the Baths and the dome of the Pantheon, and in SS. Sergius and Bacchus we see reflected the glory of these buildings—tradition carried forward, and yet a striving after something original. The priests, the architects, the Emperor, desired to originate new forms, not only in plan, but in details. The Basilica form of building seemed to serve every requirement, not only in the civil, but also in the religious life. As Christians they sought after something nobler, a building inspired by their religion; and so Anthemius argued that a Christian church should be perfect in itself, having a great dome over, vieing in beauty with the blue dome of heaven over the Sea of Marmora, cliffs, flowers, and forests of his beloved land of Asia Minor.

The dedication took place on December 26th, 537, in the eleventh year of Justinian's reign. The church was again consecrated in the fifth year after the fall of the dome, and in the 26th year of Justinian's reign. The church after its repair is described and eulogised by three contemporary authors—Paul the Silentiary, Agathias, and Evagrius.

Modern Opinion of Santa Sophia.

Our own contemporary architectural historians continue to write in the same eulogistic strain as all have done through the ages since its erection.

Professor C. Gourlay, who has personally examined the church, writes: "I consider St. Sophia to be the perfect embodiment of a Christian church."



Mr. R. Phené Spiers has personally studied this building, and has told us that "no building in the world produced an effect parallel to that which is obtained on entering the great Mosque of St. Sophia," and that "the great beauty of it was that which was obtained by being able to seize the grandeur gradually by the various proportions of its parts, the whole building being gradually sub-divided." Mr. James Fergusson, in his History of Architecture, writes:—"Turn as we will, and compare it as we may with any other buildings of its class, the verdict seems inevitable that St. Sophia, internally at least, for we may omit the consideration of the exterior as unfinished, is the most perfect and the most beautiful church which has yet been erected by any Christian people." The able studies of Mr. Lethaby and Mr. Swainson are worthy of special study. The authors were in love with their subject, and they have succeeded in conveying an impression of the beauty and the surpassing fascination of St. Sophia. In their preface we read:—"Santa Sophia is the most interesting building in the world's surface. Like Karnak in Egypt, or the Athenian Parthenon, it is one of the four great pinnacles of architecture, but unlike them, this is no ruin, nor does it belong to a past world of constructive ideas, although it preceded by 700 years the fourth culmination of the building art in Chartres, Amiens, etc., and thus must ever stand as the supreme monument of the Christian cycle." Mr. Reginald Blomfield, A.R.A., tells us in his essay on Byzantium, that "The real achievement of the Byzantine Greeks was not in their decorative detail, beautiful though this was, but in their mastery of constructional form, their power of handling great masses of building, a power inherited from the Roman builders, yet transported by the finesse and subtlety of Greek genius into fairyland of poetry. The strength of Rome is there tempered by the intellectual distinction of the Greek. St. Sophia is the culminating point of ancient art, the point at which for once in the history of art the East and West joined hands."

The Church of Santa Sophia having been admired by all through many centuries, the question naturally arises, Why, if this building is so wonderful and so beautiful, has it not been copied and studied, and the composite system of construction carried to even a more complete solution? The answer may be that the churches a few centuries later realised and desired that the symbol of their Faith, the Cross, must be built from the very foundations. The Turks are the only people who have copied and continued the building in the same manner, for example the Mosque of Suleiman I., the Mosque of Ahmed I., and many others said to have been designed and built by the Greeks for their new masters in Constantinople, etc.

The Author's Personal Impressions.

Through the kindness and influence of the Royal Institute of British Architects and our Embassy at Constantinople, I received a permit or Erada from the Sultan to measure, sketch, and photograph any church or mosque in his capital, in the year 1903. For weeks I studied the great church, and made a careful survey of the plan, measured the north aisle, and made many sketches of the interior and exterior. I gradually mastered the construction, and the more I studied the more I

*Abstract of a paper read by Mr. J. B. Fulton, A.R.I.B.A., at the ordinary general meeting of the Architectural Association held on November 20th

PAVILION AT THE FRANCO-BRITISH EXHIBITION. FRANCIS S. SWALES, ARCHITECT.

admired the building; although there may be several faults, on the whole it is sound and logical, especially when you consider the materials.

The Buttresses.

Four great stone pieces or buttresses were built (67ft. 6in. by 25ft. 2in. by 101ft. 8in. apart from N. to S.), and not only did they carry the weight of the cross arches, but also were designed to take the thrust of pendentives supporting dome and cross connecting arches supporting dome. The necessary depth of the buttresses allowed for openings to be left forming the north and south aisles, the thrust of dome also necessitated the buttresses being carried to the height of the base of dome far above the roof of aisles; and therefore forming features in the elevation which are so charming and logical. Four columns on floor level on either side support six columns on gallery level, which carry the weight of wall built under the wall arches of dome on the north and south.

The Aisles.

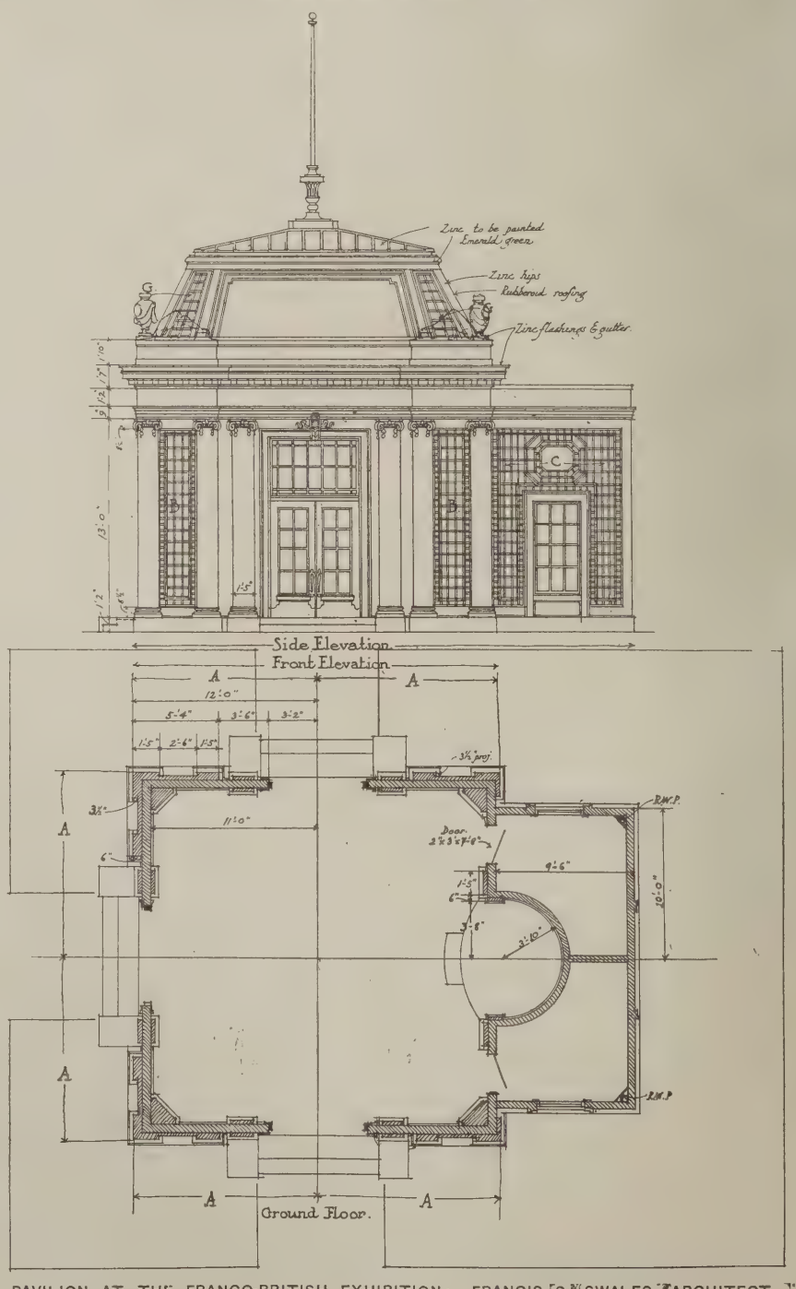
The aisles have lesser columns supporting a vaulted ceiling forming the gallery floor; columns are again used on the gallery level which support a vaulted ceiling forming the roof. The outer walls are formed by piers taking the thrust of the vaulting; and between the piers the windows fill up the space, so that the wall surface is small comparatively. The windows are all arched, and has marble mullions, with square openings cut out of white marble, forming sash bars to receive glass. A few of the smaller parts are made in wood to open for ventilation. The great arches under the springing of the dome are about four bricks or about 5ft. thick. The depth, including the cornice, is about 6ft. The centre of the arches is about 2½ft. above the springing, so that they are more than semi-circular. In the internal angles formed by them are the four pendentives.

The Dome.

The dome springs from the cornice on 40 piers, about 3 to 5in. broad on the inside, and about 8½ft. deep. They are connected by arches which form windows 4ft. 10in. wide. Inside, the piers form part of the ribs, which have about 6in. projection at the springing, and gradually diminish till they reach the great circle of 37½ft. in diameter. The dome rises 46ft. 9in. above the cornice. The pendentived dome-covered space is bounded on the north and south by the aisles, galleries and what might be termed the wall arches or lunettes; to the east and west great niches are formed, with lesser niches, the latter being called exedra. The niches or semi-domes are so arranged that the thrust of the dome is carried to great piers forming an abutment to the barrel vaults at the east and west ends. At the east end the thrust is further taken by the niche forming the apse, and at the west the narthexes and piers take the thrust, and give the necessary abutment. The great niches are 42ft. 3in. by 101ft. 8in , so that they continue the building east and west 207ft. 9in.

The Semi-domes.

The exedra measure 41ft. 6in. by 21ft. Two columns on floor level support arches and cornice, which curve in plan, forming the niche, and take the thrust and weight of the vaulting in north and south aisles. Two columns on ground floor support six columns at gallery level, and the semi-dome springs from the cornice crowning the niche-formed exedra. This feature, so effective in plan, rises in elevation to such a height so as to allow windows to be inserted. The barrel vaults, 47ft. 6in. by 18ft. in the centre at east and west ends, and the exedra on either side cut into the semi-dome of the great niches about the same height. Five windows break through each of the great semi-domes, giving to the interior a certain doubtful charm. The semi-domes follow the curve of the east and west arches, supporting the dome.



At the east end, the niche forming the sanctuary is lighted by a double tier of three windows, and the semi-domes pierced by five windows. At the west end, three entrance doorways are placed, leading to the church from the narthex, the central one being larger, 12ft. 3in. by 18ft. high.

The Charm of the Interior.

At gallery level, columns support arches, cornice, and mullions forming the great western window. The breadth of the nave between pier walls is 108ft., the length, exclusive of apse, is 244ft. 6in., and the breadth of the interior, including aisles, is 228ft. 10½in.

The great beauty and charm of the interior lies, not only in the constructive features, but also in the power and beauty of great horizontal cornices, placed at the correct relation to height, and broken only on plan. To me this is the secret of Byzantine design, and nowhere has it been used to greater advantage than here in this vast pendentived hall. Standing at any point in the nave, your eye moves from one vista to another in endless variety. The golden vaulting of the aisles and galleries give colour and distance, while all the nearer features carry your eye to the great dome, crowning all. The views of the nave from the aisles and galleries are unsurpassed, the columned low-vaulted richness of the aisles contrasting with the seemingly infinite height of the nave.

The Great Court at the west end, which

PAVILION AT THE FRANCO-BRITISH EXHIBITION: FRANCIS [illegible] SWALES, ARCHITECT.

SOUTH ELEVATION

EXTENSION OF THE GENERAL POST OFFICE, GLASGOW. W. T. OLDRIEVE, F.R.I.B.A., F.S.I., ARCHITECT. (*See next Page.*)

existed as late as 1873, has disappeared, and there is now little to recall the atrium with its fountain, etc. Three central doors and two side doors lead to the exonarthex. Five doors lead to the narthex, the windows of which are above the roof of the outer narthex.

Above the narthex a gallery is built connecting the north and south galleries; the windows forming a pleasing feature in the elevation.

Some Features of the Decoration.

The decoration of the interior is full of refinement and colour. The walls of nave and aisles are covered with marble plating. Horizontal bands run round at different heights, and the spaces between are filled with single panels and vertical pieces. A feature is made of bands of notched fillets, and the more important panels have sculptured frames. The cornice in the aisles is perhaps the most beautiful Byzantine cornice in existence, and is carved in relief with a frieze of white and red marble inlay. The columns of marble and porphyry are very beautiful, with their sculptured capitals in the Ionic Byzantine order. The spandrils are composed of white and red marble, or compo and green porphyry. The vaulting of the aisles and gallery and all surfaces above the upper cornice of nave are decorated with mosaic.

Fossati's Restoration.

In the year 1847 the Italian architect Fossati restored and decorated the church. Salzenberg, who is said to have been Fossati's assistant, made very complete and careful measurements of the great church, his book undoubtedly being the present authority on this noble building.

The altar, the original church furniture, the relics, the later history, especially the latter, was varied and interesting. Note also the fine bronze doors in the narthex. The weakest points of the building have evidently been the four corners, because they have been thrust about 18in. back from their original position; but everywhere great piers have been built, and, after the Turkish occupation, the four minarets were built in the 16th century.

Discussion.

The chairman, Mr. Walter Cave, called upon Mr. A. E. Henderson, to whose close study of the church Mr. Fulton had made a graceful reference, and whose presence was therefore a matter for congratulation, to propose a vote of thanks to Mr. Fulton.

Mr. A. E. Henderson, in proposing the vote of thanks, dwelt at some length upon the construction of the church of Santa Sophia, and recommended everybody to endeavour to see it. Mr. Fulton had described lucidly its setting out, and the simplicity of its design—the latter a point that was not generally realised. Many lessons were to be learnt from the plan. Reinforced brick, of which the church was chiefly built, possessed an analogy with the reinforced concrete of to-day. The speaker had had the privilege of seeing the church while it was under repair, but had not been permitted to view the semi-dome from the exterior. Through the kindness of the Turks, he (Mr. Henderson) had been allowed to operate from August 19th, 1889, until the end of November. Students, he might observe, were now permitted to use a tape measure. This surely was a valuable opportunity for Britishers. Intending visitors would find it essential to have a man who knew the language, but this he recognised involved an expensive item that few students could afford. He believed, however, that talking was not conducive to consistent work. He advised students to go East, and to study Roman and Grecian work in its purity, not in the Renaissance spirit. He confidently believed that hardly an architect goes to inspect the huge city at Ephesus, in spite of its being a British domain.

Mr. Statham, in seconding the vote of thanks, realised his misfortune in never having seen Santa Sophia. He shared with Mr. Fulton the opinion that it was a most wonderful building. Fergusson, he believed, was wrong in trying to deprive Anthemius of credit for the design. He knew of no other churches in the district that were built with pendentives. It was interesting to read accounts of contemporaries of its wonderful effect upon men's minds when it was new. He did not think the section of the dome was altered after its first fall. It would prove an interesting experiment to try the effect of a flat dome. He knew not whether he was heretical, but he always considered the exterior to be rather a failure, having the appearance of being designed to support the interior.

Mr. Walter Millard was glad that Mr. Statham had alluded to the earlier form of dome, the original dome, in his opinion being a prolongation of pendentives.

Mr. Geoffry Lucas pointed out that, like Wren, Anthemius was fortunate in his opportunity.

Sir Brumwell Thomas hoped that anyone experiencing difficulty in prosecuting a survey of the church would communicate with the Association.

Mr. Mat. Garbutt remarked that the early builders constructed with a total disregard for life, with the result that they were able to produce works of beauty that it was impossible to obtain to-day, when the designer was tied down to engineering considerations.

The chairman (Mr. Walter Cave) said that the drawings shown by Mr. Fulton were a truly remarkable achievement. He added his hearty thanks to the vote already proposed and seconded.

Mr. Fulton, replying to the vote of thanks, mentioned St. John's, Ephesus as being another unmeasured church. Speaking of the domes, he expressed the opinion that their collapse was more attributable to earthquakes than to a lack of scientific knowledge.

The meeting then ended.

A new screen that has been erected in Bangor Cathedral to the memory of the late Lord Penrhyn, is in the Decorated style, from designs by Messrs. J. Oldrid Scott and Son, the architects to the cathedral. It is divided into six bays, in two of which the gateway is formed. From the buttresses arise traceried cusped and carved ogee gablets, and the rood is topped by a richly moulded cornice. The work has been executed in wainscot oak by Messrs. John Thompson and Co., of Peterborough.

EXTENSION OF THE GENERAL POST OFFICE, EDINBURGH.

This extension, which is in the course of erection, is situated at the east side of the present post office, and is a continuation of the block facing south and overlooking the Waverley station. The east elevation faces the Low Calton. The extension is being built to relieve the letter and parcel sorting departments, as well as the storage for the telegraph engineers.

The area of the site is 1,520 sup. yds., and is almost entirely covered by buildings, which consist of seven storeys, and will rise to a general level of 99ft. above the Low Calton Street pavement. Nearly the whole of the basement floor will be utilised as a telegraph engineers' store, the remaining portion of the floor being used as a heating chamber. Two stone staircases rise from this floor, and there will also be two electric lifts running to the floors above. On the Low Calton Street floor there are a covered van-way and loading platform, 85ft. long and 38ft. wide, with entrance and exit to the Low Calton. Next to this, a smaller covered way, 50ft. long and 16ft. wide, with platform, will be used for hand-carts. Immediately over the covered way for hand-carts, and overlooking the loading platform, will be provided a room for the drivers of the vans, with lavatory accommodation. Two staff entrances, one leading to a staircase and the other to an entrance hall where an electric lift will be in use, are also provided at the Low Calton level, giving access to the seven upper floors. The rest of the floor area, consisting of 5,360 sup. ft., will be used as a telegraph engineers' store, with stone staircase at the north-east corner, and the electric lift rising from basement to the first floor in the south-west corner. This floor, which will be almost entirely used as the post-office store, has an area of nearly 9,000 sup. ft. The second floor will be a continuation of the present parcel sorting hall, whereby an extra floor area of 7,810 sup. ft. will be added to the accommodation. A considerable part of the present outside stone is being taken down, so that one huge sorting hall will be formed; whilst on the fourth floor, for letter sorting, the same method is being adopted, giving an extra floor of 9,065 sup. ft. These two large apartments are well lighted by large windows on three sides, and the walls are lined from floor to ceiling with ivory-coloured bricks having the bases and cornices relieved in other colours. The floors will be laid in wood blocks.

Part of the second floor and entresole floors between the second and fourth floors and the fourth and sixth floors, give large accommodation for cloakrooms and lavatories for the staff. On the sixth floor there will be a special service instrument room and telephone rooms, with cloakrooms, etc., for the female telegraphists and telephone operators, also one or two stores. These rooms are also well lighted by windows facing the south, and with additional light from the roof. The seventh floor, which is an entresole floor, will be used as a telegraph store, having a floor area of 1,680 sup. ft.

The elevation to Low Calton, Waverley station, and the return at the Inland Revenue offices, are faced with freestone from Doddington Hill Quarry, Northumberland. This stone has the peculiar effect of looking almost a reddish stone just after being quarried, but after it has been exposed to the weather for a time it will very nearly match the existing stone of the present post office.

The style of the building is regulated by the design of the present building, the south elevation being very similar to that existing. The whole building is built on the latest hygienic and fire-resisting principles, woodwork is reduced to a minimum, and glazed brick is extensively used throughout, while ample stone exit stairs are provided in case of emergency. The heating is to be on the low-pressure hot-water system, and the illuminant electric light.

The building is being erected from designs by Mr. W. T. Oldrieve, F.R.I.B.A. F.S.I., H.M. Principal architect for Scotland, under whose supervision the work is being carried out. Through his courtesy we are enabled to give a drawing showing the principal part of the extension. The shaded part represents the existing building. The contractors for the foundations were Messrs. A. Waddell and Sons, Edinburgh, and for the superstructure Messrs. A. Colville and Co., Edinburgh. The structural steelwork is being executed by Messrs. Alexr. Finlay and Co., of Motherwell. The clerk of works is Mr. James Reid.

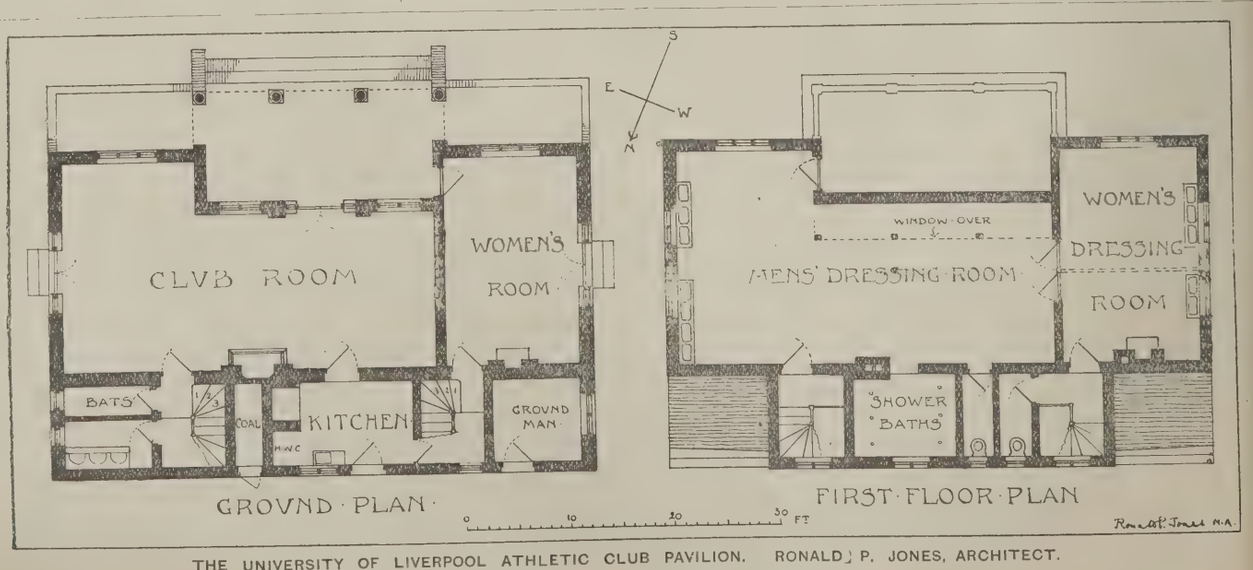
Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Dec. 1	POSTER FOR BUILDING EXHIBITION, OLYMPIA, April 17th to May 1st, 1909. Premium £105. Open to Architects and Architectural Students only. Particulars and entry forms from H. Greville Montgomery, M.P., Exhibition Offices, 43, Essex Street, Strand, London.
Dec. 14	§BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos, Town Clerk, Town Hall, Blackpool. Deposit £1 1s.
Dec. 19	WHITTINGHAM. ANNEXE TO ASYLUM FOR PAUPER LUNATICS for the Lancashire Asylums Board. Limited to Architects who are in practice and are ratepayers in the County of Lancashire. The new building is to accommodate 700 inmates. Premiums of £100, £50, and £25. Particulars and plan of site from Leonard Colman, Law Clerk to Committee of Visitors, 8, Lune Street, Preston. Deposit £5 5s.
Dec. 31	*CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50 £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council, Bodmin. Deposit. £1 1s.
No date.	SWINTON. New Schools in Cromwell Road for the Swinton and Pendlebury U.D.C. Limited to Architects having offices within ten miles of Manchester. Premiums of £50, £25 and £10. Instructions may be obtained by letter on or before November 5th, to W.T. Postlethwaite, Council Offices, Swinton, Manchester.

** These competitions have been unfavourably reported upon by Correspondents.*



§The Council of the R.I.B.A. advised Members not to compete, but see note below.

Blackpool Library Competition.

The R.I.B.A. has issued a circular in the following terms:—"The Blackpool Corporation having, in response to the representations made by the Institute, removed the most objectionable features in the conditions of this competition, the Council of the Institute now withdraws its previous advice to members to refrain from competing."

Proposed Secondary School for Girls, Brighouse.

The governors, on November 18th, accepted the design of Messrs. Sutcliffe and Sutcliffe, Hebdon Bridge, in this

THE UNIVERSITY OF LIVERPOOL ATHLETIC CLUB PAVILION. RONALD P. JONES, ARCHITECT.

UNIVERSITY OF LIVERPOOL ATHLETIC CLUB PAVILION. RONALD P. JONES, ARCHITECT.

competition. The drawings will be on exhibition during the whole of the present week at the Museum Room, The Rydings, Brighouse. There were fifteen competitors.

ETON MEMORIAL HALL AND LIBRARY.

The buildings that have been erected in memory of Etonians who fell in the South African war, and were opened by the King on November 18th, comprise a new hall and library. The hall, which is 140 ft. by 53 ft., with a height of 44ft., the length being divided into five bays by coupled Corinthian columns, will seat 1,100, and the library accommodates about sixty students and 24,000 books. The designs were selected in a competition in which Mr. Norman Shaw, R.A., as assessor, assigned the first place to Mr. Lawrence K. Hall, F.R.I.B.A., of Westminster, whose plans, after some modification in conjunction with Mr. S. K. Greenslade, A.R.I.B.A., were adopted. The buildings are designed in the style of the English Renaissance of the period of Wren; and the ceilings, of cast fibrous plaster, have been modelled by Mr. Arthur Broadbent, from designs in the spirit of that period by the architect. Externally, Portland stone has been used, in conjunction with a purple grey brick similar to that which seems to have been a favourite with Wren. The general contractors were Messrs. Henry Willcock and Co., of Wolverhampton, and their tender for the "shell" of the buildings amounted to £37,000.

Notes and News.

A statue of the late Canon Fleming is proposed. The suggestion is that it should fill one of the vacant niches of York Minster.

* * *

A grain elevator to be erected at Fort William is to be the largest of its kind, and will have a capacity of 4,000,000 bushels of grain. The contractors are Messrs. James Stewart and Co.

* * *

The Hotel Chatham, in the Rue Volney, Paris, a favourite resort of British and American travellers, has been partly rebuilt and entirely modernised, from plans by M. Decaux. A new wing, which was recently opened, includes a restaurant in which the Louis Seize decorations are by MM. Henri and Emile Rousseau. Every bedroom communicates with a bathroom and is fitted with a telephone. The original hotel was about 300 years old.

* * *

"Greek Buildings represented by Fragments in the British Museum" comes to a close with Part IV., which deals with the Theseum, the Erechtheum, and other works. Prof. W. R. Lethaby (the author) and Mr. Batsford (the publisher) deserve the gratitude of students of architecture the world over for thus rendering more widely accessible, and more completely comprehensible, the priceless fragments of Hellenic architecture contained in the national collection. We hope to have an opportunity of noticing this valuable series at greater length.

UNIVERSITY OF LIVERPOOL ATHLETIC CLUB PAVILION.

In 1907 the University of Liverpool acquired from the Corporation a new ground for the use of the Athletic Club, adjoining Calderstones Park. The pavilion here illustrated was built and presented to the club by its president, the late Mr. C. W. Jones. A club-room and dressing-room are provided for both men and women members, and the first floor plan is so arranged that during the winter months the women's dressing-room is shut off from its staircase and opened to the men's room, being divided by a movable partition, for the use of visiting football teams. The bath-room is fitted with six shower baths; and lavatory basins, with hot and cold water, are fixed in both dressing-rooms. Spectators obtain a view of the cricket pitch from the recessed loggia on the S.E. front, and from the paved terrace on either side of it. Stabling for a horse, and a storing place for nets, mowng machine, etc., are provided in a separate building to the S.W. of the pavilion. The materials are roughcast on the ground floor, and red tiles on the first floor and roofs, the woodwork of the loggia and clock turret being painted white and the rest dark green. The architect was Mr. Ronald P. Jones, M.A., of Stone Buildings, Lincoln's Inn, a former student of the School of Architecture at the University, and the builder was Mr. J. A. Hunt, of Hoddesdon, Herts. Messrs. Geo. Jackson and Sons, Ltd., executed the coat of arms in relief and other special work was carried out by Messrs. Thomas Elsley, Ltd., and the Birmingham Guild of Handicraft.

THE ARCHITECT'S CERTIFICATE: SOME LEGAL ASPECTS*.

By A. M. Brice.

The position of the architect who is empowered to issue certificates indicating that the builder is entitled under a contract to certain advances, or expressing his satisfaction with partly or wholly completed work, is undoubtedly one of some difficulty, and the issue of such certificates has raised, and has been the occasion of deciding, many nice legal propositions.

Consequently, in considering the nature of the architect's certificate, and, in particular, the varying conditions under which it may issue and the varying results which such certificates may produce, it is desirable, first of all, to consider the position of the certifying architect.

And, in the first place, the certifying architect, in being called upon to approve or condemn the work of the contractor, may be required to discharge two distinct and in some measure conflicting duties. On the one hand, he is acting as the avowed agent of the building owner, and, on the other, when issuing a final certificate, he is acting in a quasi-judicial manner between building owner and builder. As agent it is his duty to safeguard the interests of the building owner; as dispenser of the final certificate, it is his duty to act impartially between both building owner and builder. As agent of the building owner there is no privity of contract between him and the builder; consequently, there is no duty owing from him to the builder. As final certifier, he ceases to be the agent of the building owner, and is bound to act fairly and without bias towards both parties. Further, if the contract makes no provision for the submission of a dispute between the parties to an arbitrator, the conclusive certificate of the architect becomes a quasi-judicial function, and he himself becomes quasi-judge and arbitrator.

The position and duty of the architect in each of these distinctive capacities must now be considered, but, before doing this, it will be convenient to summarise briefly the various certificates which in one or the other capacity he might be called upon to issue.

The architect's certificates are readily divisible into two clearly distinguished classes—they are either conclusive and final, or they are non-conclusive and interim.

To the non-conclusive class belong all ordinary progress certificates (though by the terms of the contract each progress certificate may be made conclusive and final, so far as it applies), and in the conclusive class are placed certificates for additions or deducions, for retention moneys, and of final satisfaction, completion, and payment.

The non-conclusive, interim, or progress certificate is given during the progress of the work, and is in respect of the amount of advances held by the architect to be due to the contractor. It usually entitles the contractor to the payment of such advances as may have been agreed upon to be paid in accordance with such certificate.

*Substance of a paper read before the Institute of Builders, on November 11th, by Mr. A. M. Brice, of the Middle Temple and Oxford Circuit, Barrister-at-Law; author of "The Legal Liability of the Architect."

The conclusive certificate for additions or deductions is ordinarily given after the receipt of all claims by the contractor, and is in respect of any additions to or deductions from the contract price. It authorises the payment of such sums as may be found due in that respect.

The conclusive certificate for retention moneys is given either upon or after the completion of the works, and is in respect of the payment of such moneys or some part of such moneys as may have been retained. It authorises the payment of such sum to the contractor.

The conclusive certificate of satisfaction is given either upon or after the completion of the works, and is in respect of the satisfaction of the architect with such completion. It denotes that the work is complete, and that the period of maintenance has begun.

The conclusive final certificate is given either upon or after the termination of the maintenance period, and is in respect of the architect's approval of the maintenance and repair of the works, of the remedying of such defects as may have been discovered, and, in general, of the due performance of all the obligations imposed upon the contractor by the contract. It authorises the payment by the employer of the final balance due to the contractor.

Both classes of certificates, conclusive and non-conclusive, may or may not be conditions precedent to the recovery of payment by the contractor.

A certificate is a condition precedent when either expressly or by implication the contract price is not payable until the certificate is given.

A certificate is not a condition precedent when either expressly or by implication the contract price is payable independently of the certificate.

We now pass on to consider

The Position and Duty of the Certifying Architect as the Agent of the Building Owner.

As agent of the building owner, the architect must not exceed the limits of the authority he derives from the building contract. If he does, his certificate will not be binding either on the owner or the contractor.

In consequence of the architect's position as agent to the building owner, the certificate is simply the expression of the approval of the employer through the architect that certain acts which the contractor has agreed to perform have been so far or so completely performed as to meet with that approval of the employer which the contract requires before partial or final payment can become due or payable.

The duty of the certifying architect in his capacity as the agent of the building owner is comparatively light. It is comprised within the range of such certificates as may be merely ministerial—that is, which do not call upon him for a final opinion dependent on the exercise of judgment and professional skill. The certifying that certain materials have been supplied, that a given amount of work has been done, that something agreed to be delivered has been delivered, that something which the architect had power under the contract to order has been ordered by him and supplied, that the times agreed upon for performance have been complied with—in short, while issuing non-conclusive interim or "progress" certificates is ordinarily discharging a ministerial duty as agent for the building owner (see Tindal, C.J., in Morgan *v.* Birnie (1833) 9 Bing. 672), and so long as he does his duty as that owner's agent—that is, so long as he exercises all proper care, displays all reasonable skill, and acts honestly and bona fide, and within the scope of the authority granted him, he discharges his liability to the building owner. Acting in such a manner, he is under no liability to the builder, between whom and him, as already stated, there is no privity of contract.

Again, if the terms of the contract provide or imply that the decision of the architect shall not be final, he gives even what purports to be a final and conclusive certificate, not in a quasi-judicial, but in a ministerial way. For example in the case of Robins *v.* Goddard [(1905) 1 K.B. 294], the contract contained this clause: "No certificate of the architect shall be considered conclusive evidence as to the sufficiency of any work or materials to which it relates, nor shall it relieve the contractor from the liability to make good all defects." And, in addition to this, an arbitration clause was inserted in the contract. It was held by Lord Justice Stirling that the former clause was not to be confined to making good defects, and that the arbitration clause clearly prevented any certificate of the architect being regarded as final.

In those cases, then, in which an architect gives a certificate which is not to be final or conclusive, and consequently not a condition precedent to payment to the builder or to the builder's relief from further liability, the law infers that the architect is not discharging a quasi-judicial office, that he is not acting as a quasi-arbitrator nor even as a dispute-preventer, but that he is acting as an agent of the employer, with a contractual duty to safegurad the interests of that employer and do his bidding. Thus, in the case when an architect is not authorised by the contract to value, and his certificate is not agreed to be binding on both parties, his certificates are only binding upon the building owner when they are in strict accordance with the contract and with the authority vested in the architect. And even if such certificates are expressed by the contract to be conditions precedent to payment, the building owner is not bound by them if the architect, in giving them, does not comply strictly with the terms of the contract, and act, that is, within the limits of the authority conferred upon him as the building owner's agent. Although as the employer's agent, he may have purported to express the employer's approval, that approval will not bind the employer in such circumstances.

The chief function of the certifying architect when regarded as the agent of the building owner is to issue from time to time, in strict compliance with the contract, non-conclusive interim or progress certificates, which shall acquaint the employer with the amount of the advances he may properly make to the builder.

Non-Conclusive or Progress Certificates.

These progress certificates are not binding or conclusive certificates, and relate generally in an approximate degree to the value of the work or the quantity of the materials dealt with in the certificate. Consequently they cannot be cited as conclusive evidence when the final certificate is to be considered, nor can

they be so cited in a court of law or arbitration in the event of a claim for damages for breach of contract or a claim upon a quantum meruit. A good authority for this is Tharsis Sulphur & Copper Co. *v.* McElroy [(1878) 3 App. Cas. 1040], where Lord Cairns very clearly pointed out the position of such progress certificates. "The certificate," he said, "I look upon as simply a statement of a matter of fact, namely what was the weight and what was the contract price of the materials actually delivered from time to time upon the ground, and the payments made under those certificates were altogether provisional, and subject to adjustment or to re-adjustment at the end of the contract." Lord Hatherley, in the same case, described a progress certificate as "not an exact sum made up by calculation of items and by applying the prices to the quantities of articles supplied under those items It is really nothing but this—it is an account sent in to show that the company are quite safe in making such payment as they may think fit by way of advance, because there is now upon their ground property of such value." Similarly, Lord Blackburn: "They were made out with a view to regulating the advances, and showing how much should be paid on account, not at all as showing how much was to be ultimately paid upon the final account and reckoning."

Progress certificates are not only not conclusive as to the value of the work done or the materials supplied, but they are not conclusive as to the quality of that work or of those materials. This was shown in Cooper *v.* Uttoxeter Burial Board [(1865) 11 Lt. 566], where it was held by Vice-Chancellor Wood that it was competent for an architect who had given progress certificates from time to time to withhold his final certificates on the ground that the work had not been executed in a workmanlike manner. This judgment is all the stronger because at the time the progress certificates were granted it was pointed out to the builder by the architect that the work was not being executed in a workmanlike manner. In that case, too, the contractor unsuccessfully asked to have it declared that the withholding of the final certicate was a fraud on the contractor.

On the other hand, there is no doubt that when a progress certificate has been issued, a debt is created and becomes due and payable— unless, of course, the building contract shall have otherwise provided. For although the contract may be an entire contract, and consequently, in the absence of special provisions, no payment is due until the whole contract is completed, yet as a matter of fact it is almost the invariable custom to insert in the contract a clause or clauses providing for the granting of progress certificates as acknowledgments of value received and as authority for payment on account. Thus, in the case of Pickering and Another *v.* The Ilfracombe Railway Coy. [(1868)L. R. 3 C. P. 235] it was held that the issue of a progress certificate created a debt due which constituted a valuable consideration for an assignment which was subsequently made.

A progress certificate may operate to vest property in a new owner, and generally this is provided for by the contract. It is naturally a question of the construction of the contract in each case at what stage and by what means the property shall pass; and as Lord Blackburn observed in South *v.* Moore [(1886) App. Cac, 350 Cp.; also Reid *v.* Macbeth (1904) App. Cas. 223], it is "a question of fact in each case whether that stage has been reached." Thus in the Banbury and Cheltenham Railway Co. *v.* Daniel [(1885) 54 L. J. Ch. 265], in an agreement between the plaintiff company and the defendant a contractor, for the construction of a railway, it was provided that once a month the company's engineer should certify the amount payable to the contractor in respect of the value of the materials delivered, and that such certificate should be paid by the company seven days after presentation. It was held by Pearson, J., that the property in "materials delivered," upon their being certified for by the engineer, passed to the company, though the materials were not fixed. "The question I have to determine," said Mr. Justice Pearson, "is whether the defendant is now at liberty to take away any of these materials which have been brought upon the company's land for which certificates have been given. In my opinion, he is not entitled to do so. . . . Where the contract is that the materials are to be paid for as they are brought upon the company's premises, the inference is that as they are certified for by the company's engineer they become the property of the company."

Progress certificates are conditions precedent to payment merely by force of the contract between the parties. Such certificates may, of course, be subject to any conditions upon which the parties are agreed. By force of contract, too, it is possible that progress certificates may operate to waive the right of the building owner to recover liquidated damages from the builder on the ground of delay. The case of Laidlaw *v.* Hastings Pier Coy. ["The Times" (1874), November 28, p. 11] illustrates this. In that case it was shown that the engineer had authority to order extras, to grant expansion of time, to give conclusive certificates, and settle all disputes. Accordingly the engineer gave numerous progress certificates entitling the contractor to receive payment for the works and extra works, and the company had paid the contractor on such certificates: and subsequently the engineer gave his final certificate to the contractor, and sent to the company the whole account, with his corrections and deductions, signed and approved by him. Thereupon the company refused payment of the balance due to the contractor, and, on his claim for that balance, counterclaimed, inter alia, for liquidated damages. It was held that the engineer's certificates as to what sums had fallen due were conclusive, and that the company had waived the damages, and no claim for liquidated damages could be sustained.

Progress certificates may occasionally operate as orders in writing for extras; but in order to be effective for this purpose, the certificate would be required to certify more than the whole contract price. Upon this being done, however, a new contract may be implied to pay for the extra work, and this would depend on the fact whether the building owner has contracted to pay on the certificates. Moreover, it would exclude a corporation from its operation as not being a contract under seal.

Secondly. The Position and Duties of the Certifying Architect when acting in a Quasi-Judicial Manner.

While the architect, when acting as the agent of the building owner, has a duty to be partial to that owner's interests, and no contractual duty at all to the builder, directly he is placed in a position by the contract or by the two contracting parties in which he is to be called upon to determine or assess, finally and conclusively, some question of fact between those parties he ceases to be an agent of one party, and becomes a quasi-arbitrator or quasi-judge between the two parties. As such, he is bound to discharge his powers impartially; as Lord Collins has said, he is "clothed with the duty of exercising an impartial judgment" (Chambers *v.* Goldthorpe [(1901) 1 Q. B. 641)].

The fact that he is the agent of the employer does not matter, for it is a fact well known to the contractor; and it is to be assumed that the contractor has taken all probable risks into his consideration before he assents to putting the agent of the employer into the position of a quasi-arbitrator. The building owner has stipulated that his architect, his agent, shall be the person to decide questions of fact— of work and value— or to determine disputes raising out of the contract and the builder in assenting to such a course puts it out of his power to object to the bona-fide certificates and decisions of a quasi-arbitrator thus appointed (Sanger *v.* Gt. Western Railway [(1854 S. H. L. C. 72.] "The architect," said Lord Denman, in Goodyear *v.* Weymouth Corporation [(1865) 35 L. J. C. P. 12] "is to be responsible for deciding between the parties; and if he decides honestly, the parties have no right to complain to anybody."

But it is a condition precedent to the validity of his certificates that he shall act bona-fide in an independent and impartial manner. If it can be shown that the architect, when acting as a quasi-arbitrator, has not been impartial and fair as between the parties, then his certificate can be set aside, Pawley and Turnbull [(1861), 3 Giff., 70]. Further it was held in Kemp *v.* Rose [(1858) 1 Giff. 258; and see Dimes *v.* Grand Junction Canal (1852) 3 H.L.C. 759] that, without any fraud being alleged, the decision of the architect was not binding upon the builder, if there was "the smallest speck" or circumstance calculated to bias his judgment and unknown to the builder. On the other hand, a strong but honest expression of opinion made by an architest in his capacity as building owner's agent does not disqualify him from acting subsequently as a quasi-arbitrator Cross *v.* Leeds Corporation [(1902) Hudson, vol. 11, p. 369, 3rd edn.]. The fact that the architect has interests consequent on his employment as such is known to the builder, and it is presumed in law that the builder knows that the architect receives reward from the building owner for discharging certain duties and for acting as his agent; that it is his duty to do his best for his client; to make good bargains for him; that he has probably gven his employer an estimate of the maximum cost of the work in hand; that it is to his professional interests to keep the cost down to that estimate and to avoid or, if inevitable, to keep down the cost of all mistakes and extras; that he has himself prepared the contract and often determined the nature of his own authority and duty; and that in the course of the work, and while and after acting as quasi-arbitrator, it will be his duty to have constant dealings with either the building owner or the builder in the absence of the other. But Lord Collins

has laid it down that [Cross *v.* Leeds Corporation [(1903), Hudson, vol. 11, 371; and see Jackson *v.* Barry Railway (1893 71 Ch. 478, Ives *v.* Barker (1894) 2 Ch. 478, Eckersley *v.* Mersey Dock and Harbour Board (1894) 2 Q.B. 667], "contractors as well as employers know perfectly well what they are about." And even should the architect express strong opinions on a matter in dispute between the parties, Lord Collins, in the case just quoted, said that contractors "cannot come afterwards and complain of the very thing which they have agreed to, namely, that the person who is now asked to act as arbitrator has expressed, and strongly expressed, an opinion as to a particular contention which they are now setting forth."

(*To be concluded.*)

Our Plates.

The New Cowdenbeath Higher Grade and Mining Schoo'.

For the combined Elementary, Supplementary, Higher Grade, and Mining School, proposed to be erected at Cowdenbeath for the Beath School Board, the plans have been prepared by Mr. William Birrell, architect, Kirkcaldy. The site of the school is on an eminence near the centre of the town belonging to the Stevenson-Beath estate. The building has been designed in the form of a parallelogram, measuring 222ft. by 60ft., with side porches for boys' and girls' entrances, and a one-storey building on the centre front forming the principal entrance, measuring about 80ft. by 28ft.

The front of the school will face north, and is of simple design, with plain piers between the windows, which are surrounded by plain margins, the whole being relieved by pedimented gables at the ends, and parapet above the wall cornice. The main entrance front has been slightly accentuated by columns, and by a large circled pediment over the entrance doorway; while the main wall behind is finished with four large circular windows, giving direct light to the assembly hall. The roofs will be covered with light sea-green slates from Westmorland, while the roof of the centre block, having been carried above the general level of the side wings, and surmounted by an ornamental belfry, gives the building a substantial and balanced appearance that is consistent with a public institution.

Owing to the difficulty and expense of obtaining suitable stone, it is proposed to execute the elevations with red sandstone from Closeburn Quarry, Dumfriesshire.

The main building is of two storeys and a basement, and has corridors 8ft. wide, on each floor, running the whole length of the building. Owing to a considerable fall in the level of the ground, it was deemed advantageous to form a basement under the greater part of the school, and this has been mainly utilised for laboratory work. The accommodation provided consists of a large engineering laboratory, with a commodious testing-room, and store-rooms leading off same, while on the other side of the corridor is provided the drawing office. The remainder of the basement is taken up with large covered playgrounds for use in wet weather, which can be reached from the corridor, together with a playroom and a cookery room. The walls of the playgrounds are lined with enamelled brick, and the playground is fitted with fireplaces for the use of pupils from the country.

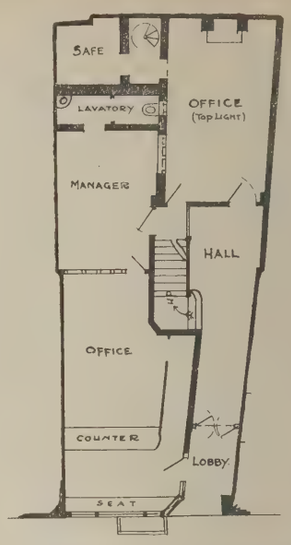
On the ground floor is a one-storey building at the front, comprising headmaster's and janitor's rooms, and two class-rooms, each for forty pupils. Leading from this is the assembly hall in the main building, the ceiling of which is arched and carried up to the roof. Access to the various class-rooms, which are mainly facing south, is obtained from the assembly hall, and the corridors leading off some, while on the first floor the corridors have been connected to the assembly hall by means of a balcony. In this part of the building there are two class-rooms, each for forty pupils, and seven class-rooms, each for fifty-two pupils. On this floor also are provided large and well-appointed cloak-rooms for the different grades, and at the ends of the wings is situated the staff room accommodation.

The first floor is entirely devoted to higher-grade students, and comprises four class-rooms for thirty pupils, and one for twenty-four pupils, together with a large art room, wood workshop, chemical and physical laboratories (with preparation, balance, and optical rooms adjoining), a large lecture theatre, and ample storage accommodation. Communication between the different floors of the building is effected by means of a large staircase at each end of the building, arranged in short flights.

The floors throughout will be executed in reinforced concrete, covered on top with wood floorings, and all the beams and columns will be encased in concrete, thus adding to the rigidity of the structure and considerably reducing the fire insurance premium.

It is proposed to light the building by means of electric light, which will be generated by a dynamo and suction gas plant placed in the mining-engineering section of the school. This plant will be capable of lighting the whole building, driving the electric ventilation fans, and at the same time available to the mining students for instructional purposes.

The heating is proposed to be carried out on the low-pressure hot-water (drop) system, and ventilation will be secured by means of fresh-air inlet gratings at the windows, and two large extract fans on the roof drawing the foul air through the ducts leading from the various apartments.



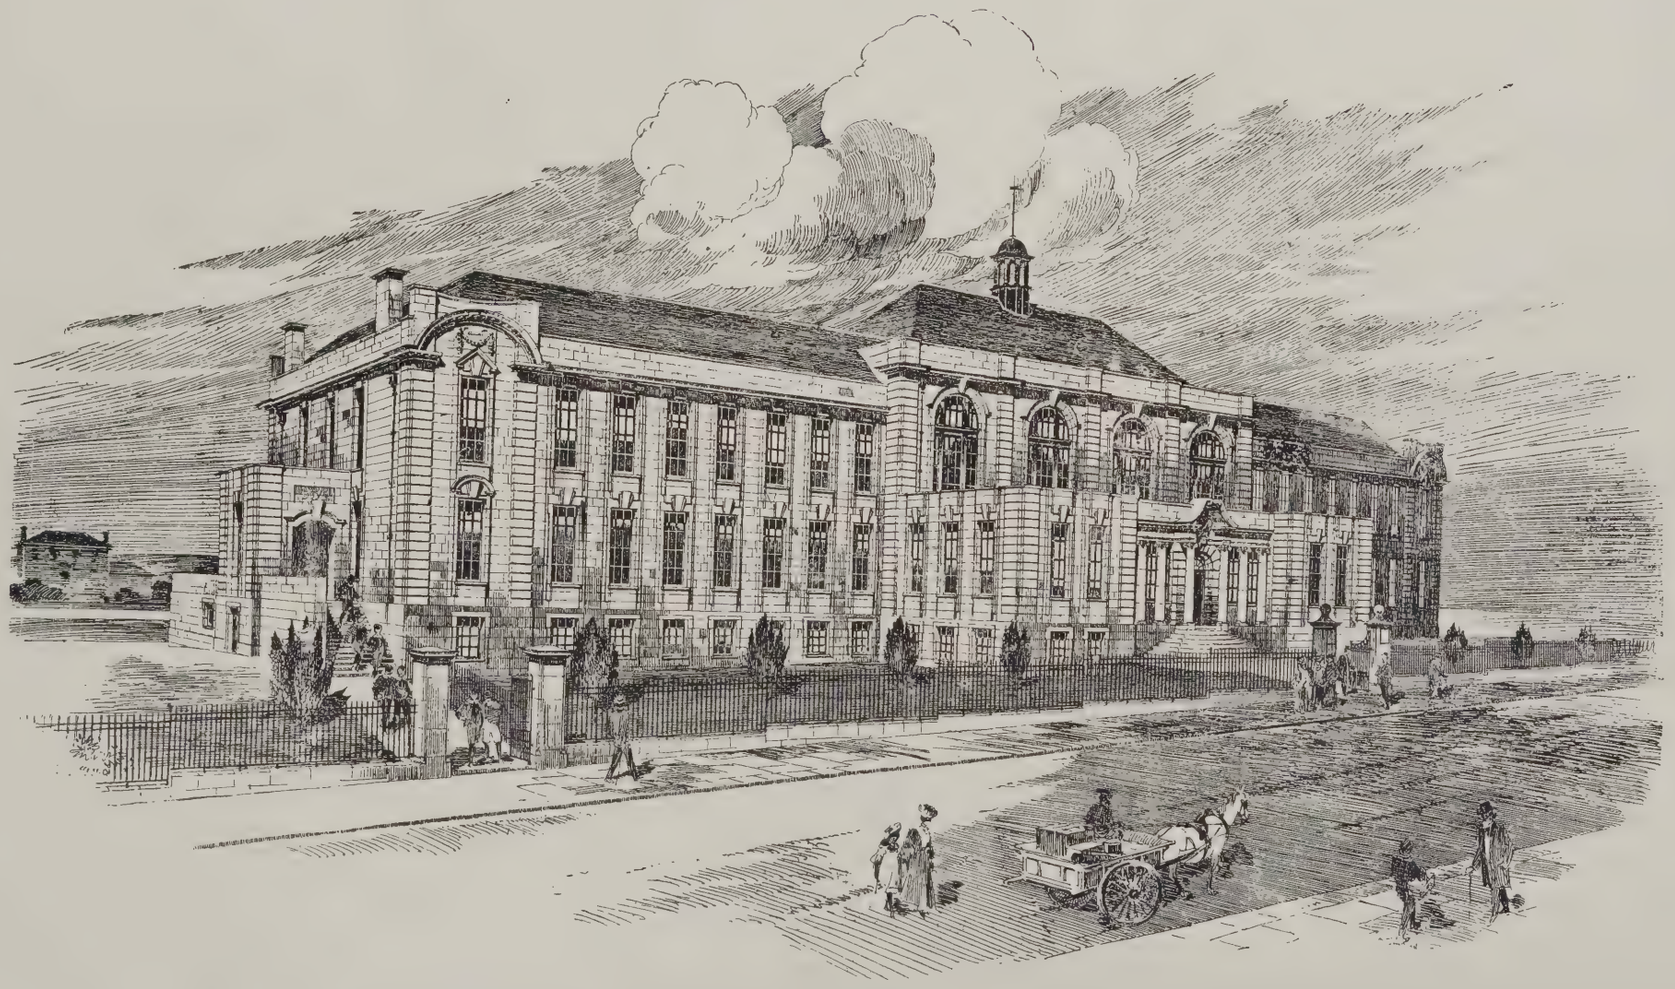
The plans have been approved by the Department. Estimates have been accepted, and the work is to be proceeded with immediately. The total cost is under £20,000.

New Business Premises, No. 4, Wood Hill, Northampton.

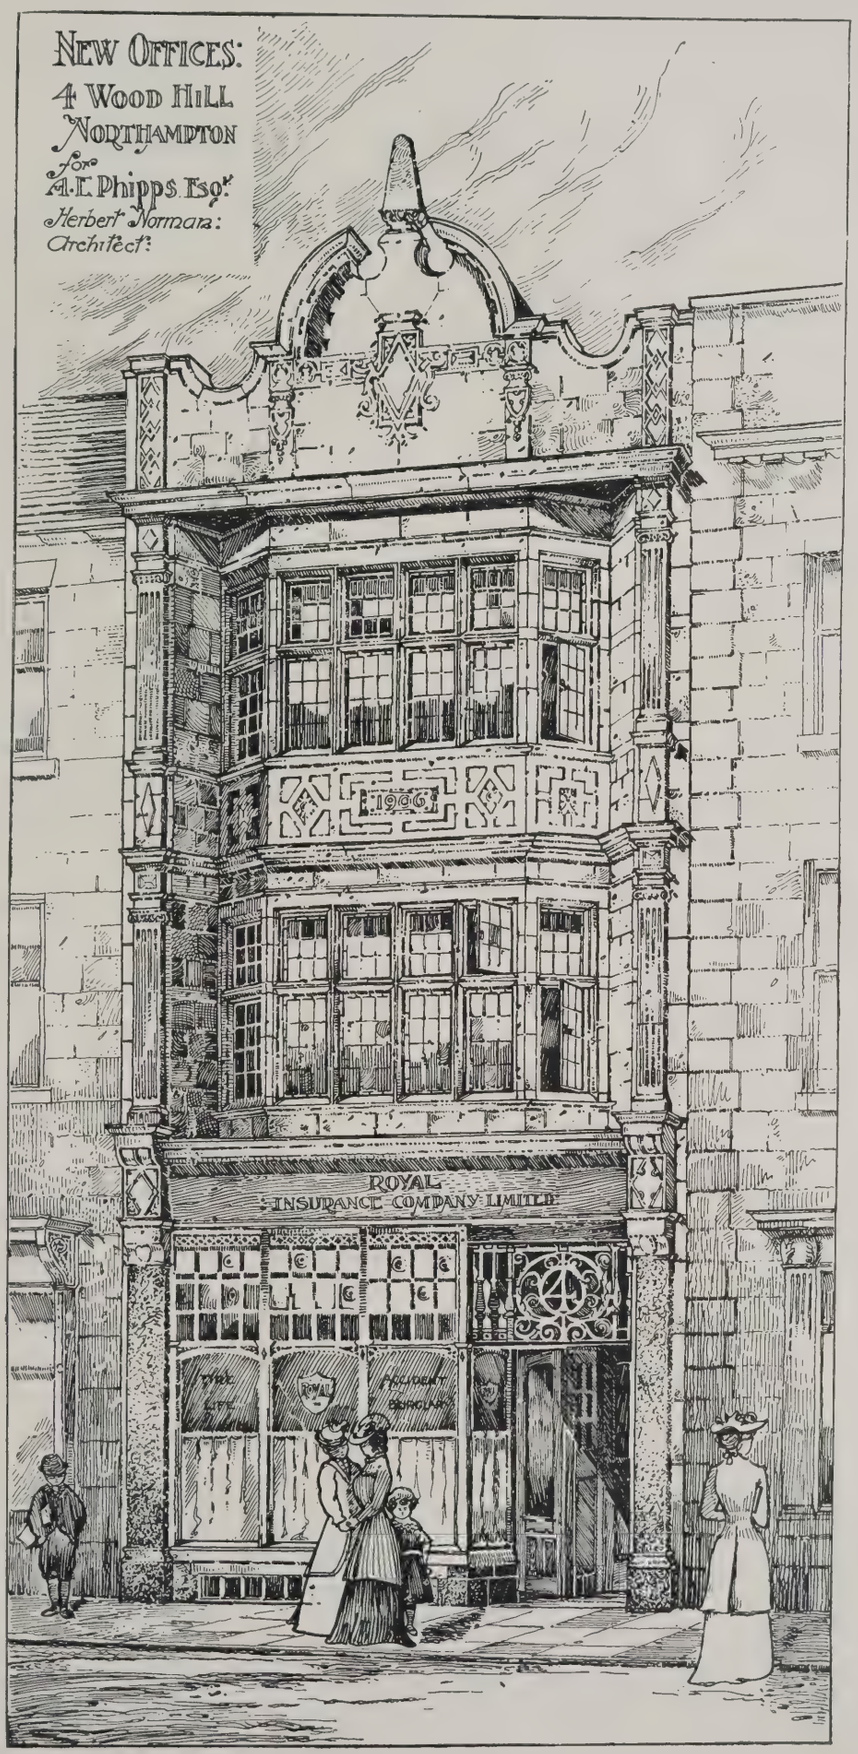
This building erected from the plans of Mr. Herbert Norman, whose offices are on the second floor, has recently been completed for Mr. A. E. Phipps, solicitor, who occupies the first floor. The front is carried out in Weldon Stone, with steel casements and leaded lights to the windows. The heating, by low pressure with radiators, was installed by Messrs. Grose, Norman and Co., Northampton. The contractor was Mr. Henry Green, also of Northampton.

Measured Drawings.—No. 1, Gates at Eagle House, Mitcham, Surrey: Measured and Drawn by Joseph Seddon.

It is our intention to give in alternate issues measured drawings of fine architectural details, accompanied by photographic illustrations where necessary to



GROUND PLAN, NEW BUSINESS PREMISES, 4, WOOD HILL, NORTHAMPTON. HERBERT NORMAN, ARCHITECT.



adequately display the work. We believe these will be of considerable value to architects, students, and others, for the purposes of study. Our plate this week is a drawing of the fine seventeenth century gates at Eagle House, Mitcham, and is the first of several details of this house that we propose to publish. Concerning this house, Mr. Seddon has furnished us with the following particulars:

"Local tradition names Sir Christopher Wren as the architect of this house, but it is not improbable that, like many other houses of the later Renaissance, it is founded on Inigo Jones' designs; for Coleshill Eagle House relies for its effect on symmetry, good detail and proportion; the materials of which it is built being of the most ordinary kind. The walls are of yellow stocks with red quoins and plinth; the arches to window openings, string courses, and chimney heads, are in gauged red brickwork, clean and sharp to this day. The hood to entrance and the eaves cornice are of wood. The roof is covered with green slates, with a lead flat and lantern at top, enclosed by a massive wooden balustrade; from here a magnificent prospect is afforded over the country. The ground floor window openings on north and south elevations may have been bricked up in the days of the window tax; there is a straight joint at the reveals. The bottom sash of the staircase window is now removed, and the opening filled with panelling and door to modern building, but the jamb lining and pulleys remain, giving sufficient indication for its restoration on paper. A flight of steps was at one time a prominent feature of the garden elevation, but no trace of it remains, nor anything to show how the symmetry was maintained. Internally the ground, first, and second floors are panelled throughout. The house has fallen somewhat into decay, and like the wrought iron gates, has suffered from ill treatment. The date on the rain-water heads is 1705."

Lord Chatham's retreat at Hampstead, known as North End Place, and formerly as Wildwoods, was offered at auction on November 17th, but had to be withdrawn; the highest bid being £14,000, whereas the property had cost the vendor altogether nearly £27,000.

Proposed New Works.

The Local Government Board has decided to hold, or has recently held, as the appended dates respectively indicate, inquiries into proposed expenditure by public bodies as follows:—Water supply, works, and plant, Ystradgynlais R.D.C., £1,530, for Colbren (November 25); Birmingham C.C., £3,525, for a boating pool (November 25); Haslingden B.C., £400 (November 25); sewerage, drainage, sewage disposal works, and plant, Weybridge U.D.C., £3,500 (November 25); Pontardawe R.D.C., £14,000 (November 24); Failsworth U.D.C., £2,512 (November 26); Shoeburyness U.D.C., £250 November 24); Stone R.D.C., £2,700, for Hanford (November 27); Folkestone B.C., £30,000 (December 1); Finchley U.D.C., £6,350 (November 24); street improvements, widenings, new roads, public works, and pleasure grounds, Royton U.D.C., £13,000 (November 27); Great Crosby U.D.C., £2,400 (November 24); Failsworth U.D.C., £5,205 (November 26); Barking Town U.D.C., £500 (November 27); Shoeburyness U.D.C., £1,267 (November 24); Heston and Isleworth U.D.C., £9,298 (November 26); Birmingham C.C., £9,000 (November 25); Haslingden B.C., £4,000 (November 25); Finchley U.D.C., £11,784 (November 24). Various, Luton B.C., depo extension, £2,150 (November 25); Oxford C.C., £5,00, for reconstruction of cattle market (November 24); Shoeburyness U.D.C., £900, for fire station, etc. (November 24).

Amersham.—At the recent monthly meeting of Amersham Rural District Council, the following were among the plans approved:—House, Parkfield Avenue, Chasham Bois, Messrs. B. Stone and Son; additions to house, Pollards Wood, Chalfont St. Giles, Messrs. Jarvis and Richards; house, Parkfield Avenue, Chesham Bois, Mr. H. Belch; house, North Park Road, Chalfont St. Peter, Mr. H. Brown; new drainage, The Firs, Great Missenden, Mr. G. Bailey; house, Penn Road, Penn, Messrs. Burgess and Myers; house, Orche Hill Avenue, Chalfont, Mr. W. T. Walker; dwelling-house, Bull Lane, Chalfont, Messrs. Walker and Hopkins; iron room, Holmer Green, Messrs. T. E. Smith and Co.

Berkshire.—The Berkshire County Council has been recommended by its education committee to apply to the Local Government Board for sanction to the following loans:—A sum of not exceeding £7,920 for the erection of a boys' secondary school at Maidenhead. A sum not exceeding £3,790 for the erection of a Boys' Council School at Wallingford. A sum not exceeding £3,570 for the erection of a council school at Waltham St. Lawrence. A further sum of £500 (in addition to the amount of £886 already sanctioned) for the erection of a manual instruction and cookery centre at Abingdon.

Finchley.—Finchley District Council has received the sanction of the Local Government Board to borrow £5,758, in connection with street improvements.

Hereford.—The Local Government Board has sanctioned the scheme for demolition and re-building works on the Bewell Street area. New roads and sewers on the Barrs Court Land are to be started immediately.

Lancashire.—The Lancashire Education Committee have decided, by 20 votes to 19, to build a training college for 153 female teachers, and to invite other authorities to co-operate in the scheme, which will cost £43,000, of which the Government will provide three-quarters.

London, W.—It is proposed to build a new hospital in Bulstrode Street, London, W., to supersede the present premises of the West End Hospital for Nervous Diseases, in Welbeck Street. In order that the proposed building may be thoroughly up to date, the committee of management have deputed Mr. Ian Malcolm, Dr. Harry Campbell, Dr. T. D. Savill, and Mr. Paul Phipps to form a travelling commission to visit and report on similar institutions on the Continent.

Newbury.—A Local Government Board enquiry was held here on November 17th, respecting an application for a loan of £1,500 for the demolition of the Georgian town-hall. The removal of this building will enable the widening of Mansion House Street.

North Berwick.—At a special meeting of the town council, it was announced that the late Miss Elizabeth Edington, had bequeathed to the town council, in trust, free of legacy duty, £10,000, for the erection of a convalescent home, in or near North Berwick, to be called the Edington Convalescent Home.

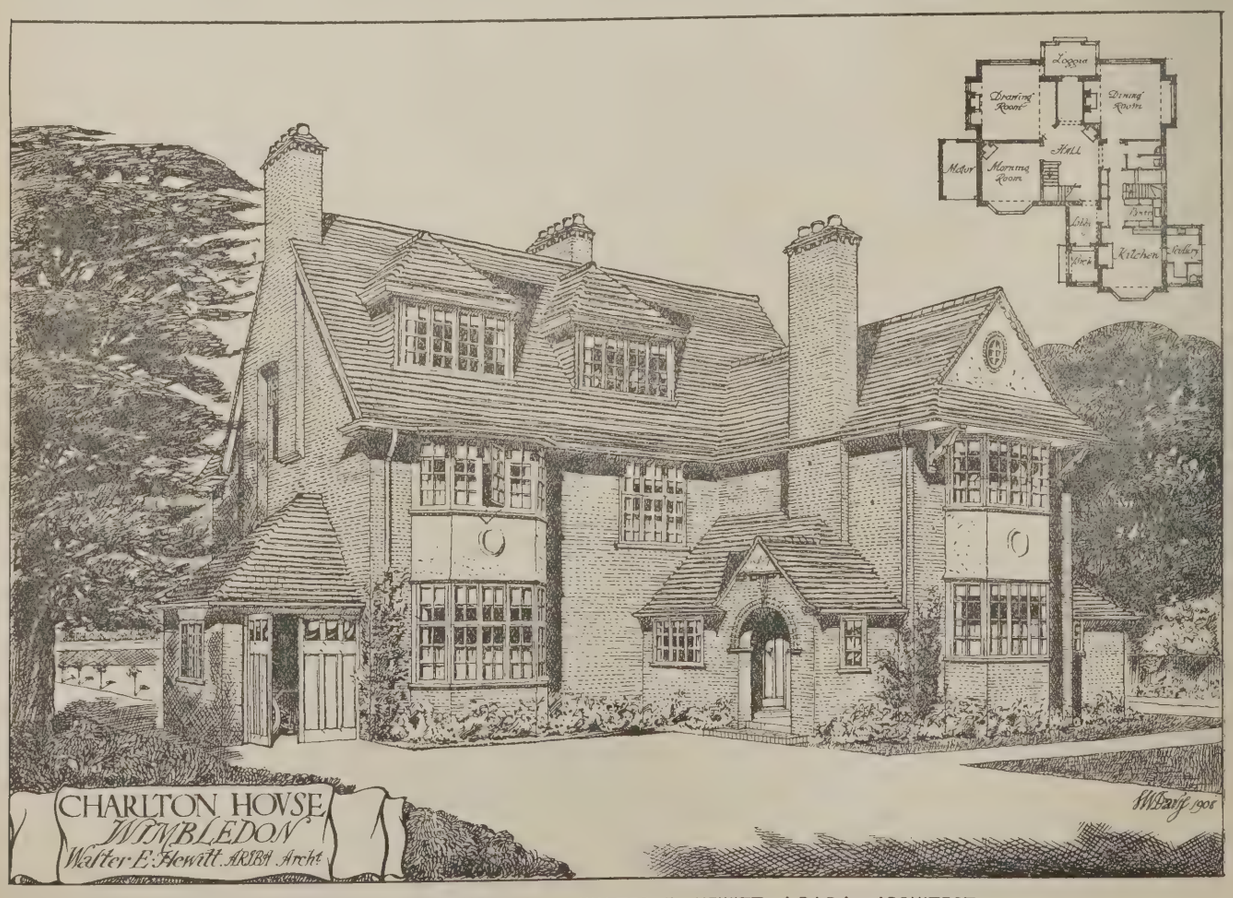
Oxford.—The City Council has applied to the Local Government Board for sanction to borrow £5,000 for the reconstruction of the cattle market.

Staines.—At a recent meeting of Staines Rural District Council, the following were among the plans approved:—Mr. W. G. Ratcliffe, a pair of villas in Staines Road, Bedfont; Mr. E. L. Shepard, a bungalow at Reedsfield Road, Bedfont; Mr. H. J. Barrett, three houses in Redmead Road, Harlington; Mr. E. Perrott, a bungalow in Townsend Road, Ashford; Mr. G. W. Passingham, a house at Bath Road, Poyle, Stanwell.

Stirling.—The directors of Stirling Royal Infirmary recommend an extension of that institution to provide twenty-one more beds. The sum required will be about £5,000.

Walsall.—At the last meeting of the streets committee of Walsall Town Council, only four sets of building plans were submitted.

Waterford.—The Viceregal Commission having recommended the construction of a steel bridge, at an estimated cost of £114,500, the Harbour Commissioners have lodged a formal protest against the "enormous outlay," and are pressing for an alternative scheme to be proposed by the various local public bodies who are interested in the matter. A ferro-concrete structure is suggested.



Buildings in Progress.

Harrogate.—A new mission-room for the Grove Park district of Harrogate, of which the foundation stone has just been laid, is to cost, with the land, about £800. The external walls will be constructed of local bricks, covered, from the ground floor upwards, with roughcast, and the roof will be covered with Welsh slates. Mr. Samuel Stead, of Harrogate, is the architect, and Mr. R. Airton, also of Harrogate, the builder.

Langside, near Glasgow.—The foundation stone has just been laid of Battlefield Church, Ledard Road, which is to be built of red sandstone from Corsehill Quarry, Dumfriesshire, and has been designed in early English style by Mr. H. E. Clifford, F.R.I.B.A., of Glasgow. The area and choir will accommodate 514 persons, and the galleries, which are to be supported on steel joists, will seat 328. The total cost of the church, with a hall for 700 persons, is estimated at £6,000.

London.—A start has been made on the works for London's new county hall, on the Surrey side of Westminster Bridge, where the first few piles have been driven into the mud of the foreshore. The contractors for the first portion of the work are Messrs. Price and Reeves, and the contract for the embankment has been let for £62,662.

Rawcliffe.—A new chancel to the parish church of St. James, which has just been dedicated by the Bishop of Beverley, has been built from designs by Mr. Walter H. Brierley, F.S.A., of York; the contractors being Messrs. William Ainley and Co., of Doncaster. The cost, including furnishing, has been about £3,000, which was given by the late Mr. Ralph Creyke, of Rawcliffe Hall.

CHARLTON HOUSE, WIMBLEDON. WALTER E. HEWITT, A.R.I.B.A., ARCHITECT.

This house was recently erected in the Murray Road, Wimbledon Common. The plan was largely influenced by the site being narrow (70 ft. wide), for the accommodation required, and the sunny aspect (S.W.) being in the rear. The external walls are of red brick of varying shades, the headers being of a darker colour; and the roofs are of thick hand-made sandfaced tiles. Mr. A. Leather, of Wandsworth, is the builder.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
The querist's name and address must always be given, not necessarily for publication.
Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Finding Girder Sections.

CRICKHOWELL.— SURVEYOR writes: "Are there any instructions published by means of which, and the tables of sections supplied by the makers, one may quickly arrive at the size and weight of a steel girder required in a particular position?"

The handbooks published by firms such as Dorman, Long and Co., Ltd.; Redpath Brown, Ltd.; and H. J. Skelton and Co., give the safe uniform loads which given sections will carry, and also the weight per foot run; otherwise there is no quick way of arriving at the weight and size of a steel girder required in a given position. The general procedure is to find the maximum bending moment in inch-tons (M). Dividing this by the working stress (seven tons per sq. in. for steel), we get the necessary section modulus, and then, if the girder is of a type built up of joists or channels and plates, we choose a section from the catalogue with a modulus not less than this. If the girder is a plate or bar girder, we proceed as explained in the standard text-books on the subject. Compare the writer's book, "Theory and Design of Structures" (by Ewart S. Andrews, B.Sc.: Chapman and Hall, London; 9s. net), p. 528 onwards. A.

Rights of Adjoining Owners.

SOUTHSEA.—H. writes: (1) A and B are adjoining owners. A room is A's house, on the second floor, is lighted by a window overlooking the roof on B's premises. A is contemplating rebuilding, and in doing so will raise the height of his storeys. Will the right of light (ancient) be vitiated by altering the height of window to suit it to the new conditions? (2) B's roof abuts against and is maintained by the wall of A's house (not a party wall). Will A be justified, after giving B due notice of his intentions, in taking down this wall, and will B be entitled to any compensation for disturbance during the removal and rebuilding of the said wall?"

(1) Yes, the window must remain—substantially at least—in the same position as the ancient light it supersedes. If "A" wishes to make any alteration in the size or position of the windows, he would do well to submit drawings to the owner of the adjoining property (the "servient tenement") for his approval. (2) I am of opinion that "A" will be doing rightly in taking down his wall (after duly giving "B" warning, in order that he may take any precautions against damage), but "A" must take every care that the work is carried out with all due speed, and in such a manner as not to cause unnecessary annoyance or damage to his neighbour. F.S.I.

Village Sanitation.

BIGGLESWADE.—A.R.R. writes: "It is proposed to install a system of scavenging with carts for removing the night soil (in the same way, with modifications, of course, as dust carts collect the rubbish from ash-pits), in a certain village having no sewage system. I understand that the system of scavenging has been started in other villages, and (with how much truth I cannot say) that it constitutes a very considerable annoyance to the inhabitants. I should be glad to have an opinion on this method of village sanitation. Also I should like to know whether there is anything better than the dry earth system, where gardens exist?"

The system of sewage disposal of which you speak has been adopted in many villages and quasi-urban districts, and I have heard good accounts of it. No doubt the makers of the sanitary carts could give you the names of particular places to which they have supplied their apparatus, and you could then make personal enquiries about it. The only village where it is used of which I have any personal knowledge, reports well of the system, but, of course, it entails an addition to the rates for doing work which each occupier (in an ordinary village) can do for himself without expense. There is, in the writer's opinion, nothing better and more healthy than the dry-earth system, whether it is worked with the ordinary bucket or with some such apparatus as Moule's; the greatest mistake we are making in the country nowadays is the multiplication of cesspools for bottling up the sewage until it is foul, and then (and only then) finally disposing of it! Some day our sanitary experts will awaken to the fact that this method is not only illogical, but is abominably insanitary; but at present it is unfortunately "the correct thing." F.S.I.

Ascertaining Stresses in Roof Trusses.

ENFIELD.—O. J. D. writes: "In determining the stresses in the members of a roof truss (wood or steel) by the method of sections (or by taking moments) I find I am unable to distinguish the nature of stress obtained whether tension or compression. Will you kindly explain how this distinction is made?"

To determine, when working by the method of sections, whether any particular bar is a tie or a strut, we proceed as follows: Imagine the side opposite to that about which moments are being taken to be fixed, and suppose that a piece of the bar in question is cut out; then, if the tendency of the forces is to open the cut further, the bar is a tie; but if the tendency is for the cut to close, the bar is a strut. Consider, for example, the somewhat usual truss shown in Fig. 1, and take the bars across the section xx. To get the stress in DC,bc, take the moment of all forces to the right of xx, about the point A, where the other two bars BC and DE meet; then if this is M force in DC $= \frac{M}{Ax} =$ in this case $\frac{1 \times 5}{5} = 1$ ton.

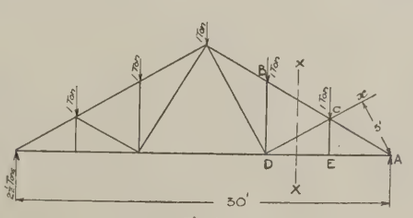


Fig. 1.

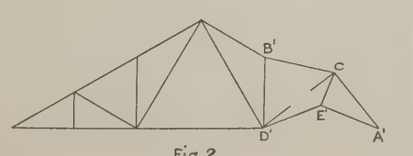

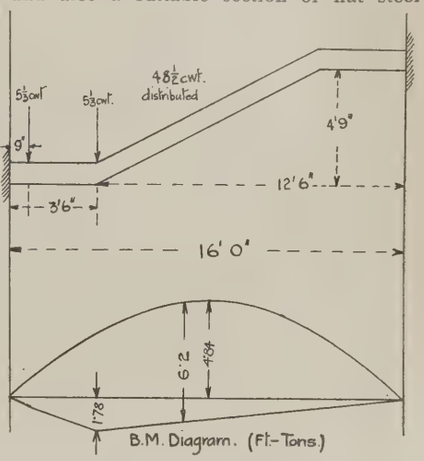

Fig. 2.

Imagine DC to be cut through, then the resultant force to the right is two tons upwards, which *tends* to distort the truss, as shown in Fig. 2, from which it is clear that DC is in tension. If BC were cut through, then the portion DCAE of the truss would tend to rise and pivot about the point D. This would tend to close BC, so that BC is in compression. A.

Stresses in Stair Stringer.

KIRKINTILLOCH.—J. S. writes: "The accompanying sketch shows the elevation of a fire-escape stair stringer, loaded as shown, and in addition the uniformly distributed load which the stringer must be calculated to carry is 48½ cwts. Please give a suitable section of channel steel, and also a suitable section of flat steel

plate, either of which might be used weakening by bolt holes not to be taken into calculation. Please state method employed in making calculation."

The accompanying figure shows the stringer and the loads which it has to carry. The bending moment diagram can be obtained as shown by considering the stringer as a simply-supported beam of span equal to the horizontal projection, and loaded in the given manner. This will not be quite accurate, as the ends are partly fixed; but it errs on the right side, and the fixing will not be sufficiently firm to treat the case as a beam with ends fixed. In addition to the bending-moment, there will be a direct thrust in the stringer which will in this case be negligible. The B.M. diagram then comes as shown, the maximum B.M. being about 6.2ft. tons. Taking a working stress of seven tons per sq. in., the necessary section modulus will be

$$= \frac{\text{BH. in inch tons}}{\text{Stress in tons per sq. in.}} = \frac{6.2 \times 12}{7}$$

$= 10.6$ inch units nearly. A 7in. x 3in. British Standard Channel would do for this, or a flat steel plate 8in. x 1in. The former of these is obtained by consulting the properties of standard sections; the latter from the formula

$$Z = \frac{bh^2}{6} = 10.6$$

where b is the thickness and h the depth of the plate. A.

Stresses in an Arched Roof.

MANCHESTER.—RETLAW writes: "A particular building that has recently come under my observation has an arched ceiling over, as per sketch enclosed, and as there is not sufficient room between

ceiling and roof for a braced truss, the engineers supplying same propose to put in simply a 6in. x 5in. steel joist for a 30ft. span. Is it worked out on the principle of the arch? I shall be glad if you will kindly explain how the problem is solved.

The stresses in the arched roof shown can be worked accurately only by the elastic theory of rigid arches. An approximate solution can be obtained by imagining pin joints to be placed at the crown C and the springings A and B; the stresses are then obtained as follows: On a sector line set down lengths 4,3; 3,2; 2,1; 1,0 to represent the forces, the spaces being numbered as shown, and take any convenient pole P and draw the link polygon A*abde*B. In this case, since the loading is symmetrical, the pole P is best taken on the horizontal line through the point 2. Draw a perpendicular through polygon in D.

Now take a new pole P_1 such that $2P_1 = \frac{2P \times DE}{CD}$, and draw a new link polygon Aa_1 b_1 d_1 e_1 B, which will pass through the point C. Then this link polygon is the line of pressure, and the rays of the sector figure give the thrust. According to the theory of arches, the bending moment at any point of the arch is equal to the thrust multiplied by the vertical distance between the centre line of the arch and the line of pressure. The maximum value of the B.M. is Q x X.

Then the max. stress is $\frac{Q}{A}\left(1+\frac{xd}{k^2}\right)$

Where A is the area of the cross section.
Where k is the radius of gyration about the centroid.
Where d is the distance from the centroid to the extreme fibre.

For a 6in. x 5in. British Standard steel joist A=7.35 sq. in.; k=2.43 in., and d=3 in.; and from the above graphical construction Q=3.7 tons and X=13.2 in.

∴ Max. stress in joist

$$-\frac{3.7}{7.35}\left(1+\frac{13.2\times 3}{2.43^2}\right)=3.9 \text{ tons per sq. in.}$$

This is quite a satisfactory stress, and although we have only used an approximate method, the result will not be far wrong. The above calculation makes no allowance for temperature stresses, which will occur in this case; but such stresses will not for this country come more than two tons per sq. in., so that the total stress will not come more than the allowable value of six tons per sq. in. The querist will find fuller explanation of the method of dealing with a three-pinned arch, and also with rigid arches, in the writer's book on "Theory and Design of Structures" (by Ewart S. Andrews: Chapman and Hall, Ltd.; 9s. net).

(Illsutrxting answer to Retlaw).

Filling up Space between Steel Joists.

CRICKHOWELL.—SURVEYOR writes: Is there much or any gain of carrying strength in filling up with concrete the space between two steel joists, which are bolted together in the ordinary way?

There is some gain in carrying strength in filling up the space between two steel joists with concrete, but no allowance is usually made in designing. A.

Oak Roof Timbers Crumbling.

CRICKHOWELL. — SURVEYOR writes: "What is the best way of dealing with an open oak roof of a church, the timbers of which are crumbling away from worm attack or dry rot? Can this decay be arrested, or must all affected timbers be removed?"

The best way is to remove affected timbers, and provide better ventilation. The decay may be arrested by various processes, although many supposed remedies are of doubtful utility. The querist will find the best description of the various processes in a book by Dr. A. W. Keim, entitled, "Prevention of Dampness in Buildings" (Scott, Greenwood and Co., London). A.

Preventing Dry Rot.

RENFREWSHIRE.—DRY ROT writes: "Dry rot is seen in the first-floor joists of a principal room in a large mansion. The ends of the floor joists and the woodwork of the windows above and below have been attacked. All infected wood or wood showing the slightest trace of the fungus has been removed, but the point of difficulty is this: The fungus has penetrated the joints of the stone wall to a very large extent, and cannot be removed, although the outside of the joints of the stonework have been carefully washed with a solution of corrosive sublimate. What can be done to prevent the fungus attacking the new woodwork which will be put in presently?"

I fear that there is but little doubt that the new woodwork will perish in precisely the same way as the old timbers, unless arrangements are made for altering the circumstances under which it is fixed. Are the timbers ventilated at the ends? Dry rot cannot be remedied, but must be prevented. The worst case I have ever had to deal with occurred in a large house in which a heating apparatus had recently been installed; in that instance, although there had been no dray rot in the building since its erection, fifty years before, the presence of felt under the roof slates prevented ventilation, and the condensation moisture rotted off the feet of all the rafters rapidly. F.S.I.

Objectionable Smells from Oil Engine.

WISBECH.—H. writes: Can you please inform me of some preventive for the objectionable smells of the oil coming from the exhaust from an oil engine? There if, of course, the usual silencer, but still the nuisance is very great.

The unpleasant smell from the exhaust of an oil engine is, of course, caused by the imperfect combustion of the oil, and it may to some extent be mitigated by careful driving and thorough cleansing. Further alleviation has been afforded by placing hay or something of that kind at the outlet of the exhaust pipe, but I fear that there is no real remedy possible—if one has an oil engine, one must have the smell attached to it. I myself was lately greatly annoyed by an engine exhausting at ground level, and I therefore fixed a pipe in a tree, thinking to find a remedy. The only result was that I had the effluvia on the first floor as well as upon the ground floor. F.S.I.

Ingredients of British Asphalt.

HULL.—J. J. writes: "Can you oblige me with a recipe for the manufacture of British—*i.e.*, artificial—asphalt? I am aware that it is a compound of tar, pitch, and sawdust or limestone, but cannot find any exact proportions given in the text books."

I fear you will have some difficulty in finding out the exact quantity of each ingredient; but "British Asphalt," originally known as "Patent British Asphalt," is a mixture of quicklime, pitch, sawdust, and ground iron-slag, heated and laid in a semi-liquid state. F.S.I.

Council Fails to Enforce By-laws.

LONDON W.—ARCHITECT writes: "Has the council of a rural district, which has adopted building by-laws under the Public Heath Acts, the power to approve of plans which are not in accordance with those by-laws? What would be the proper course to pursue to compel them to enforce the same? Is there any clause under which a council may use their discretion whether they will enforce compliance with their by-laws or not?"

The by-laws are all so worded as, *prima facie*, to leave all authority of enforcing, or not enforcing them, in the hands of the local sanitary authority, and, as a matter of fact, these authorities do often pass plans which are not strictly in accordance with their by-laws, or which disregard the rules of the Public Health Acts, as to the line of frontage. If, however, this relaxing of by-laws should cause a hardship to an adjoining owner, he would have a legal remedy against the Rural District Council, and I believe the correct process would be by an application to the High Court for a "mandamus" to compel the sanitary authority to show cause why they were neglecting to enforce the by-laws. It would, of course, be necessary to prove that the hardship was a real one, and not merely a case of unfairness, which in reality no damage to the complainant. If legal action is not desired, an appeal may be addressed to the Local Government Board, but whether with any useful result or not I cannot say. F.S.I.

Correspondence.

To the Editor of THE BUILDERS' JOURNAL.

R.I.B.A. Election of Fellows: Proposed Suspension of By-law 60.

SIR,—At the general meeting at the Institute, on Monday last, the Secretary made the following announcement:—

"The Council hereby give notice, under Bye-law 60, that a Special General Meeting will be held here on Monday, November 30th, at 7.45 p.m., before the Business Meeting, to consider a resolution which they submit to suspend Bye-law No. 9, excepting the first sentence."

As Clause No. 9 was not read out, the full importance of the proposed alteration in the by-law was probably not appreciated by those present.

We are anxious that the members of the Institute should not be taken unawares or by surprise, and we therefore advise them to read the by-law, from which they will see that, if the resolution were passed, all power of demanding a poll for the election of Fellows would cease.

We feel that there is no need to comment upon the reason for this action; but the violation of the principle of the ballot-box seems to us to be most unconstitutional. We leave it for the Associates to take what steps they may deem desirable to protect the distinction which they have gained for themselves by passing the examination.

GEORGE HUBBARD.
ALFRED W. S. CROSS.

Salmon Ladders.

SIR,—Your correspondent who asks a question on this subject on page 390 in your issue of November 18th, will find a collection of models illustrating the various forms of the salmon ladders and their application, in the Frank Buckland Collection at the South Kensington Museum. I know of no literature on the subject. FREDERICK CHATTERTON.

SIR,—*Re* the enquiry in your issue of November 18th about "Salmon Ladders," I think you correspondent might get information from either Mr. P. D. Malloch, New Scott Street, Perth, or of Mr. H. I. Bell, C.E., Athole Street, Perth. I know that both of the above have been connected with the construction of salmon ladders recently in Perthshire and other districts.

Glasgow. JAMES WRIGHT, JUNR.

Architects' Assistants in Egypt.

SIR,—With reference to your remarks relating to the probability of architects' assistants finding work in Egypt, perhaps a note of warning may be of use in preventing disappointments to anyone intending to try their fortune here. At present there is very little work of any importance going forward, and I know of four instances where failure to obtain work has occurred within the last six months, one only being an Englishman. Most of the work is done by Maltese, Italians and Greeks, and these can live on a lower wage than a Britisher, who must expect to spend at least £10 per month in living, with incidental expenses. Assistants should be on their guard against suggested opportunities of success. I find that even men who are regarded as honourable have an unhappy way of creating a false impression in the minds of those applying for positions. This is specially the case with young men, who being less experienced, are more easily handled after having been bound by, in most cases, a very one-sided agreement. The prevailing madness in high quarters for what is miscalled economy is as prevalent here as at home.

Cairo. MUNRO WILSON.

The Status of the Architect.

SIR,—I notice that comparatively few architects have taken advantage of your invitation to state their opinions upon the above subject, probably because they are practically all agreed that there is only one way of dealing with it, viz., by means of a Bill for the statutory examination and registration of architects.

The views of Mr. A. Harry Heron, set out in your current issue, are almost identical with the lines laid down in the Bill which the Society of Architects is promoting in Parliament, and, as was recently pointed out in Mr. Bond's presidential address, no serious alternative to a Registration Bill has been yet put forward for dealing with this queston, though it has been actively before the profession for more than twenty years. I venture to think that if the opinion of every architect could be obtained, it would be found that they are in sympathy with the principle embodied in the Bill. With regard to the suggestion that the R.I.B.A. should be called upon to form some definite plan of action, it is common knowledge that we have always maintained that this is the proper procedure, and, provided that the principle contained in our Bill is untouched, we have intimated our willingness to hand over the Bill to the Royal Institute and to give them the benefit of the work which we have done during the past twenty years.

There is, however, one difficulty which I think has not been touched upon, and that is the want of continuity of policy on the governing body of the Royal Institute in relation to this question. For instance, during one session they will get so far as drafting a Bill, but before anything definite can be done the annual election comes along, the *personnel* of the Council is changed, and new men come in who are antagonistic to the proposal. The Society of Architects, on the other hand, although similarly placed as regards yearly changes on its Council, is, as a body, in agreement on the Registration question, and the new Council continues and extends the work of its predecessor in this respect. We have a large following on the principle involved, apart from our own considerable membership, and the realisation of our object is only a question of time.

In the meantime, failing any other remedy, it is our intention to persevere steadily along the line we have followed for so long.

Yours faithfully,
C. MCARTHUR BUTLER.

R.I.B.A.

At the general meeting held on November 16th, after the minutes had been taken as read, Mr. Alexander Graham, hon. sec., regretfully commented on the great loss the Institute had sustained by the recent deaths of valued members, whose names were announced as follows: Francis Haslam Oldham, elected Fellow 1877; Alfred Darbyshire, elected Fellow 1870, and Vice-President 1902 and 1905; Albert Edward Gough, elected Associate 1873; Leslie William Green, elected Associate 1899, and Fellow 1907; David Gosling, elected Associate 1863, and Fellow 1873; Francis Adams Sprules, elected Associate 1906; Isaac Steane, elected Associate 1879; Louis Henry Isaacs, elected Associate 1858, and Fellow 1874; and Hugh Hutton Stannus, elected Associate in 1880, and Fellow in 1887. To the career of Mr. Stannus he paid an eloquent tribute.

At the conclusion of Mr. J. A. Gotch's paper on "The Development of House Design in the Reigns of Elizabeth and James," of which an abstract was given on page 389 of last week's issue, a vote of thanks to Mr. Gotch was proposed by Mr. E. Guy Dawber, and seconded by Mr. R. Phené Spiers. In the ensuing discussion, Professor Beresford Pite and Mr. Edwin T. Hall were the only speakers.

THE CONCRETE INSTITUTE.

The Concrete Institute held its first general meeting at the Royal United Service Institution, Whitehall, last Thursday evening, Sir Henry Tanner, I.S.O., of H.M. Office of Works (vice-president of the Institution) presiding, and some 200 members and visitors attending. At the commencement of the meeting, Mr. Edwin O. Sachs, F.R.S.Ed., chairman of the Executive, made an announcement as to the progress of the Institute, stating that it now comprises some 320 members, of whom nearly half are members of the Institution of Civil Engineers, and some 25 are distinguished Colonial engineers and architects. He pointed out the vast number of technical inquiries that had already reached the Institute, and that were being referred to standing sub-committees, and he emphasised the necessity for research in matters of concrete and reinforced concrete. He pointed out that £25,000 was being devoted by the American authorities to this subject, and some £20,000 by the German authorities, and he added that it was to be hoped that public funds would also be available for research in this direction in the United Kingdom.

Mr. Chas. F. Marsh, M.Inst.C.E., Metropolitan Water Board, then read a paper upon "The Composition and Uses of Plain and Reinforced Concrete," which was well received, and in which he pointed out some of the principal subjects which require research and further investigation, and in which he argued the necessity of standardisation both in calculations and practice. He dealt at length with the great advance made in the production of Portland cement, and the influence of this advance upon the users of concrete and reinforced concrete. He made a point of reinforced concrete requiring a special architectural rendering, and further indicated the advantage of architects and engineers not binding themselves down too much to special systems of construction.

An animated discussion followed, in which Sir John Cockburn, K.C.M.G., Messrs. Wentworth Shields, M.Inst.C.E., C. S. Meik, M.Inst.C.E., Bertram Blount, F.I.C., H. H. Statham, F.R.I.B.A., H. K. G. Bamber, F.C.S., W. T. Hatch, M.Inst.C.E., and other well-known authorities participated. The paper and discussions were thereupon summarised by Sir Henry Tanner, to whom a vote of thanks for presiding was proposed by Mr. Kirkaldy, A.M.Inst.C.E.

Mr. Charles Spooner, F.R.I.B.A., will shortly be removing from his present offices at 17, Bedford Row, W.C., to 23, Old Buildings, Lincoln's Inn, W.C.

Trade and Craft.

Glass Tiles and Slabs with Incised Ornamentation.

Mr. Gittins Powell, formerly with the firm of Messrs. J. and H. Patteson, of Manchester, has conceived a singularly happy method of tile-decoration, which Messrs. Aug. Brennecke and Co., 68, Finsbury Pavement, E.C., have converted to practice on a commercial scale. Mr. Powell's idea was that the surface of coloured glass tiles might be very effectively decorated by means of the sand-blast, or some similar process. Samples of this method of treatment that have been forwarded to us for examination entirely vindicate the process. In each case, a handsome pattern is formed by abrasion of the glazed surface, the sunk portion being, of course, "ground," or "matt," and thus affording agreeable contrast to the raised and glossy portion, and giving the effect of decoration in relief. The work is remarkably clear and true in its lines, and is obviously as permanent as it is pleasing. It is doubtless very suitable for the adornment of the walls of churches, banks, theatres, restaurants, etc. Architects' own designs can be reproduced; and we are given to understand that the process adds but little to the cost of the tiles. Coloured glass tiles and slabs of any dimensions up to 2ft. square can be treated. These glass tiles and slabs are to be on view at the next Building Trades Exhibition in London.

Fire-resisting Construction.

"Fire-resisting Structures, and their Behaviour in the Great Fire and Earthquake at San Francisco, 1906," is the title of an exceptionally chastely produced pamphlet by Mr. William Ward, chairman of the Granite Silicon Plaster Co., Ltd., 36, King's Road, St. Pancras, London, N.W. A photo-process frontispiece gives a view of the Kohl Building, San Francisco, taken immediately after the great earthquake and fire in April, 1906. This building, constructed with a full steel cage frame resting on reinforced concrete piers and a cantilever foundation, is seen standing serene and four-square amidst the ruins of brick structures. The damage to this building from the earthquake did not exceed £100, and consisted mainly in the loosening of marble wainscoting in the corridors. "The principal damage by fire was in the lower four storeys, and to several rooms on the seventh storey on the north side of the building. In every case the fire started in the respective rooms through the breaking of the glass of the exterior windows from extreme heat, igniting the contents of the rooms, and burning out everything in the way of furniture. That the fire did not spread entirely through the building and destroy it completely, as was the case in other buildings of this character, is undoubtedly due to the fact that there was no exposed woodwork either in the floors or in the finish of the building. The exterior windows were the vulnerable points, and had they been equipped with metal frames and with plate-glass, it is very probable that the building would have escaped all injury." Mr. Ward was in San Francisco during the erection of this building, and naturally took great interest in it, as he is exploiting two very important features in it—the hard plaster (identical in formula with the English granite plaster) used throughout the interior, and the 2in. solid partitions, which are identical with the partition made by the Granite Silicon Plaster Co. in England. He believes that the facts contained in the pamphlet demonstrate clearly that fire-resisting buildings can be erected.

The new telephone exchange for the National Telephone Co., just completed in Altrincham, has been carried out under the supervision of Messrs. Bromley and Watkins, architects, Nottingham. The whole of the constructional steelwork and fire-resisting floors were supplied by Messrs. Homan and Rodgers, Manchester.

Federation News.

BATH ASSOCIATION.
Secretary: E. J. B. Mercer.

The building trade here is in a dormant state, except for the number of relief works purposely put in hand to relieve the distress of the unemployed. Thanks to the action of the joint conference held some short time since between the committee of this association and the various trade secretaries, short time has been adopted by the majority of the master builders, so far as circumstances will allow, as also by the various committees of the City Corporation for the men in their employment—such short time to continue until the end of January; by which means it is hoped employment will be provided for at least an extra ten per cent. of those in need of it.

The slight dispute in the painting trade mentioned some time since has been settled in a manner satisfactory to both parties.

On October 9 the president of this Association, Councillor J. W. Knight, J.P., who is also chairman of one of the most important committees of the Civic Council, was elected Mayor of the City of Bath, with the cordial and best wishes of his fellow citizens. It may be mentioned as something probably unique amongst builders' associations, that Bath has no fewer than eight of its members serving the city on the Civic Council; and we may reasonably hope that their business capacity and practical experience will prove to be of service on the various committees upon which they are appointed to serve.

SOUTH SHIELDS ASSOCIATION.
Secretary: J. G. Robertson.

As proving the great stagnation there is in the building trade in South Shields at present, it may be mentioned that at the last meeting of the Town Improvement Plans Sub-Committee there was not a single plan before the committee—not even one for any minor alteration. This, it may be said, is a unique experience for the Plans Committee, and a gloomy one from the building trade standpoint, both as regards men and masters. It is to be hoped that soon we may have better things than this to report.

The annual meeting of the South Shields Master Builders' Association was held on Monday, Nov. 16, in the Victoria Hall, the president (Councillor J. T. Armstrong) presiding over a large and representative gathering. The secretary reported that the year had fortunately been free from the least friction with the operatives. The association had lost several members through death, but so many new members had been enrolled that the branch was numerically stronger than ever. Trade was very bad in the town—worse than it had been for years—and the outlook was not at all promising or reassuring. Despite that, however, the branch had resolved not to seek a reduction in the wages paid to the operatives, although it was believed that the state of trade warranted it. Therefore it was trusted that the employees would place this to the credit of employers in future dealings. The president also referred to the great value of the BUILDERS' JOURNAL, especially commending the useful information it contained—information, he said, that no up-to-date builder or contractor could afford to be without, and that could not be otherwise obtained. The secretary strongly urged upon all the members the necessity of becoming subscribers to the Journal.

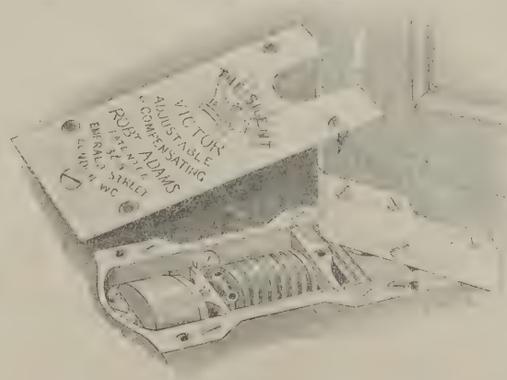
The committee take the opportunity to acknowledge, in the report, their great indebtedness to their representatives on the Northern Counties Federation and also on the Tyne and Blyth Federation.

The hon. treasurer (Mr. A. Ross) presented a satisfactory balance sheet. He congratulated the members on the fact that, despite the heavy extraordinary expenditure that had been incurred during the twelvemonth, the branch was financially in a strong position.

On the motion of Mr J. Moore, seconded by Mr. T. Anderson, Councillor J. T. Armstrong was unanimously re-elected as president of the branch.

In returning thanks for his re-election, the president assured the meeting that all he could do would be done to forward the interests of the association. At the same time he called upon all the members to continue their labours on behalf of the branch, and requested the new members more particularly to take a lively interest in all that appertained to the society's workings.

On the motion of Mr. W. Brown, seconded by Mr. J. Shewan, Mr. T. Anderson was unanimously re-elected senior vice-president. A similar compliment was paid Mr. J. V. Jary, who was unanimously re-elected junior vice-president.



A hearty and unanimous vote recorded the fact of the re-election of Mr. A. Ross as hon. treasurer, on the motion of Councillor J. T. Armstrong, who referred to the branch's deep indebtedness to Mr. Ross as treasurer for the work he had done for the association. The motion was seconded by Mr. J. J. Mays. Messrs. W. Mabley and J. Moore were elected auditors.

A strong and representative working committee for the year was elected, including some of the new members. The president (Councillor J. T. Armstrong), W. J. Robertson, A. Ross and J. V. Jary, were elected our representatives on the Northern Counties Federation.

Errata.—In the report of annual meeting of the Birmingham Master Builders' Association, on p. 401, of last week's issue, it should have been stated that it was Mr. J. B. Whitehouse who moved the election of Mr. F. G. Whittall as president, and the name of the Lord Mayor of Birmingham should have been spelt Kenrick.

"ARCHITECTURE & JOURNALISM."

This is the title of a booklet, beautifully printed and illustrated, giving an interesting account of the publications issued by this Company.

This booklet contains a suggestion, and sets out an arrangement showing how Architects and others can utilize any particular points of interest that they come across in their practice, and thus not only add to their own incomes, but add to the value and practical interest of our papers.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Nov. 26. BAILDON.—Erection of a residence at Baildon. Contractors desirous of tendering are requested to forward their applications on or before Nov. 26 to Empsall and Clarkson, architects and surveyors, 7, Exchange, Bradford.

Nov. 26. FARNBOROUGH.—Erection of a new Conservative club in Camp Road, Farnborough. Builders desirous of tendering are requested to forward their names for selection to G. W. Collins, hon. sec., Farnborough and District Conservative Club, Farnborough, Hants., on or before Nov. 26.

Nov. 26. MACHYNLLETH.—Erection of a drill hall at Machynlleth, for the Montgomeryshire Territorial Force Association. Plans and specification may be inspected and all other information obtained on written application to R. W. Davies, architect and surveyor, Dolafon, Carno, Mont., to whom sealed and endorsed tenders are to be delivered on or before Nov. 26.

Nov. 27. HESSLE.—Erection of church and schools at Hessle, near Hull, for the Trustees of the Primitive Methodists. Plans may be seen at the offices of T. Beecroft-Atkinson, architect, Trinity House Lane, Hull, and quantities obtained on deposit of 10s. Tenders to be delivered, endorsed "Church," by noon on Nov. 27.

Nov. 27. NATLAND.—Re-building of Natland Church, near Oxenholme. Contractors desirous of submitting tenders for the above, for whole or separate trades, may see the plans and specification at the church, and at the office of the architects. Bills of quantities may be obtained on application to Wright and Son, surveyors, Lancaster. Tenders to be delivered (under cover) to Austin and Paley, architects, Lancaster, not later than noon Nov. 27.

Nov. 28. CROWBOROUGH.—Erection of a new police station and police residences, in Station Road and North Road, Crowborough. Persons desirous of tendering are requested to send their names and addresses to F. J. Wood, county surveyor, county hall, Lewes, on or before November 28, from whom full particulars can be obtained.

Nov. 28. MOUNTMELLICK.—Execution of the following work in the infirmary of the workhouse, for the board of guardians of Mountmellick union, in accordance with specification, which can be seen on application to R. Goodbody, clerk of the union, boardroom, viz.:—To lay a 4 in. piped sewer from lavatory waste to sewer in yard. To provide and erect a rolled steel joist to replace existing wooden beam in new ward. To enlarge window in women's yard side of ward. To put down a new wooden floor in ward. To put down a new tiled floor in kitchen. To provide and erect a new pump stick in women's yard. To provide and set sewer trap in women's yard. To repair defective plastering on ceiling in new ward. To colour walls in ward. Tenders, endorsed "Tender for alterations in Infirmary," and containing the names and addresses of two solvent sureties willing to join contractor in a bond for the due fulfilment of the contract, will be received by the clerk of the union up to the hour of 11 o'clock a.m. on Nov. 28, and must be sent by post.

Nov. 30. AUSTWICK. — Re-building of the latrines at Austwick School, and connecting the same with the main drainage. Tenders to be sent in by Nov. 30. Plans and specifications may be seen on application to J. Capstick, The Nook, Austwick.

Nov. 30. KIRKBY-IN-CLEVELAND.—Erection of house, stables, etc., at Kirkby-in-Cleveland, for S. Dunning. Plans, specifications, and further particulars on application to S. Dunning, Oxford Street, West Hartlepool. Sealed and endorsed tenders to be delivered by Nov. 30.

Nov. 30. CRUMLIN.—Erection of a new school boundary wall, etc., in Crumlin. Plans and specifications can be seen on application to E. J. Johnson, Crumlin. Sealed tenders, addressed Committee, c/o E. J. Johnson, Crumlin, received not later than Nov. 30.

Nov. 30. CASTLEJORDAN.—Erection of new National schools, at Castlejordan, Ballinabracky, Kinnegad, County Westmeath. The plans and specification can be seen at the office of T. F. M'Namara, architect, 50, Dawson Street, Dublin. Tenders to be posted not later than Nov. 30, addressed to the Very Rev. J. Nulty, P.P., Ballinabracky, Kinnegad, County Westmeath.

Nov. 30. ABERFAN (Wales).—Erection of 47 houses and formation of new roads and drainage work in connection therewith, at Aberfan, for the Aberfan Building Syndicate. Drawings and specification can be seen at the office of T. Edmund Rees, architect and surveyor, Gernant, The Walk, Merthyr Tydfil. Sealed and endorsed tenders to be sent to W. Rees Edmunds, solicitor, High Street, Merthyr Tydfil, by Nov. 30.

Nov. 30. WAKEFIELD.—(1) Erection of partition in boys' school, East Ardsley. (2) Removing gallery in infant department of Wrenthorpe School. (3) Asphalting small portion of playground at Lingwellgate School, Outwood, for the West Riding Education Committee. Tenders must be received in the office of A. Angus, Education Office, Wakefield, on or before Nov. 30. Copies of specifications may be had on application.

Nov. 30. KENSINGTON, W.—Extending the lodge occupied by their North District foreman, situate in Walmer Road, Notting Hill, at the north-eastern corner of Avondale Park, for the Council of the Royal Borough of Kensington, in accordance with a specification which can be inspected at the borough engineer's office, Town Hall, Kensington. Securities required. Tenders, sealed and endorsed "Tender for Extending Lodge," must be delivered at the office of W. C. Leete, town clerk, town hall, Kensington, W., not later than 12 o'clock noon on November 30. Fair wages clause.

Nov. 30. RUTHERGLEN.—Roofing of the new sub-station buildings presently being erected in King Street, Rutherglen, for the Tramways Committee of Corporation of Glasgow. The whole will be let in one contract, and includes iron and steel, joiner, glazier, slater, plumber, and painter works. Offerers must submit with tender a list of the sub-contractors they propose to employ. Plans can be seen and schedule of quantities obtained on application to J. Dalrymple, general manager, 46, Bath Street, and sealed offers, marked outside "Tramways—Tender for Rutherglen Sub-Station," must be lodged with A. W. Myles, town clerk, City Chambers, not later than 10 a.m. on Nov. 30.

Nov. 30. BARNSLEY.—Erection of new school at Elsecar, near Barnsley (builder, joiner, slater, plumber, plasterer, painter); alterations and repairs to Dodworth Green Road provided school, near Barnsley (builder, joiner, slater, plumber, painter, asphalter), for the West Riding C.C. Plans may be seen and bills of quantities obtained on application to J. Vickers-Edwards, county architect, County Hall, Wakefield. A deposit of £1 is required in each case. Deposits must be posted addressed to the West Riding treasurer, County Hall, Wakefield. A separate letter must be sent to the West Riding architect for the quantities. Sealed tenders, properly endorsed, to be forwarded to the county architect, not later than 12 o'clock (noon), Nov. 30.

Dec. 1. BANGOR.—Providing "fire escapes,' for the workhouse and infirmary, for the Bangor and Beaumaris Union. Specifications can be seen at the union offices, Bangor. Tenders must reach R. B. Evans, clerk, union offices, Bangor, not later than Dec. 1.

Dec. 1. PYDLETRENTHIDE.—Restoration and repair of "Providence Cottages," Pydletrenthide, Dorset. Plan and specification can be seen at the European Inn, in the village. Tenders to be sent to M. Sampson, Neacroft, Christchurch, Hants. The highest or any tender will not necessarily be accepted, and persons tendering do so at their own cost. Tenders to be delivered not later than December 1.

Dec. 3. LONDON.—Erection of the British Museum extension buildings, second contract (superstructure), for the commissioners of H.M. works and public buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to J. J. Burnet, A.R.S.A., 2, Montague Place, W.C. Bills of quantities and forms of tender may be obtained at Storey's Gate, on payment of one guinea. Tenders must be delivered before noon on Dec. 3, to the secretary, H.M. office of works, etc., Storey's Gate, London, S.W., and endorsed "Tender for British Museum Extension, Second Contract."

Dec. 5. YORKHILL.—Construction of two goods sheds at West Basin, Yorkhill, for the trustees of the Clyde Navigation. One on East Quay, 436 ft. in length, by 100 ft. in width, and the other on West Quay, 558 ft. in length, by 90 ft. in width. Drawings may be seen and specification, schedule of quantities, and form of tender obtained, on application to W. M. Alston, the trustees' engineer, at 16, Robertson Street, Glasgow. Sealed tenders, marked "Tender for Yorkhill Sheds," to be lodged with T. R. Mackenzie, general manager and secretary, 16, Robertson Street, Glasgow, not later than noon on December 5.

Dec. 7. SUTTON.—Erection of 7 shops on the Chalk Pit House Estate, High Street, Sutton, Surrey. Plans and specification (no quantities) can be seen at the office of H. R. G. S. Smallman, A.R.I.B.A., 8, Queen Street, Cheapside, E.C. Tenders to be delivered before 12 noon on Dec. 7.

Dec. 7. BILLERICAY.—Alterations and additions to the laundry at the workhouse at Billericay, for the guardians of the union. Plans and specification may be seen, and a copy of the bills of quantities and form of tender obtained upon application to R. J. W. Layland, Architect, of Billericay, on payment of £1 1s. Sealed tenders, endorsed "Laundry Alterations," to be delivered to C. E. Lewis, clerk, New Road, Brentwood, not later than Dec. 7. The contractor whose tender is accepted will be required to provide a bond with approved sureties in the sum of £200, or a guarantee policy for that amount.

Dec. 7. RAMMEY MARSH.—Additions and alterations at the Rammey Marsh pumping station, for the Metropolitan Water Board. Forms of tender, conditions of contract, and specification can be obtained at the office of the engineer of the Eastern District, Lea Bridge, Clapton, N.E., on the production of an official receipt for the sum of £5, which sum must first be deposited with the accountant at the board's central office, Savoy Court, Strand, W.C. Such payments and applications can be made on any weekday (except Thursdays and Saturdays), between the hours of 10 a.m. and 4 p.m. Tenders, addressed to the clerk, Metropolitan Water Board, Savoy Court, Strand, W.C., and endorsed "Tender for Additions and Alterations at Rammey Marsh Pumping Station," must be delivered in sealed envelopes at the offices of the Board not later than 10 a.m. on Dec 7.

Dec. 8. LONDON, S.E.—Construction of foundation for a new block at the Chief Station of the Fire Brigade, Southwark Bridge Road, S.E., for the L.C.C. Persons desiring to submit tenders may inspect the drawings and obtain the specifications, bills of quantities, form of tender, and other particulars at the architect's department, Fire Brigade Branch, 3, Warwick House Street, Charing Cross, S.W., upon payment to the cashier of the council of the sum of £5. Tenders must be upon the official forms, and the printed instruction contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the county hall, in a sealed cover, addressed to the clerk of the London County Council, Spring Gardens, S.W., and marked "Tenders for Foundation, etc., for New Block at Chief Station of Fire Brigade." No tender will be received after 11 a.m. on Dec. 8.

Dec. 8. BAILDON.—Erection of Wesleyan Sunday School, Baildon. The plans may be seen and quantities obtained at the offices of T. C. Hope and Son, architects, 23, Bank Street, Bradford, up to Dec. 8, when the tenders are to be delivered.

Dec. 9. HOLLINGWOOD.—Erection and completion of a tramway depot at Hollingwood, for the Oldham Tramways Committee. Plans and specifications can be seen and quantities and form of tender obtained at the borough surveyor's office, on payment of £1 1s. Sealed tenders, endorsed "Tramway Depot," and addressed to the chairman of the Tramways Committee, to be delivered on or before Dec. 9, to J. H. Hallsworth, town clerk, borough surveyor's office, town hall, Oldham.

Dec. 9. LONDON, S.W.—Erection of working-class dwellings, upon a site in Grove Cottages, Manor Street, Chelsea, for the Metropolitan Borough in accordance with drawings and specifications prepared by Wills and Anderson, 24, Bloomsbury Square, W.C. Drawings, specifications, and conditions of contract may be seen at the town hall, King's Road, on and after Dec. 1, where bills of quantities may be obtained upon payment of a deposit of £1 1s. Tenders to be delivered in sealed envelopes, endorsed "Tender for Working-Class Dwellings," at the town hall, King's Road, Chelsea, not later than noon on Dec. 9.

Dec. 10. GOLDER'S GREEN.—Erection of a new church at Golder's Green (parish of All Saints' Child's Hill, N.W.). Bills of quantities obtainable from architects, Wills and Anderson, 24, Bloomsbury Square, W.C., after Nov. 20. Deposit £1. Sealed tenders to be delivered by Dec. 10.

Dec. 12. PENDEN.—Erection and completion of proposed Council school at Penden, near St. Just, for the Cornwall education committee, according to plans and specification, which may be seen by appointment at the school or at the office of S. Hill, architect to the committee, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Forms, upon which all tenders are to be made, may be had from the architect, or at the school. Sealed endorsed tenders are to be sent to F. R. Pascoe, secretary, education office, Truro, on or before Dec. 12.

No date. BLAENAU.—Alterations and additions to Blaenau, near Dolgelly, for T. Edwards. The plans, specification and further particulars may be obtained on application to Deakin and Howard Jones, M.S.A., Plas Ynys, Borth, R.S.O.

ENGINEERING.

Nov. 26. LUTON.—Supply, delivery and erection of a cooling tower at the Electricity Works, for the Corporation. Also for the supply and delivery of about 250ft. of 15in. cast-iron piping. Further particulars may be obtained from W. H. Cooke, electrical engineer, St. Mary's Road, Luton, and tenders must reach him not later than 6 p.m. on Nov. 26.

Nov. 28. EAST GRINSTEAD.—2. Supplying and erecting two sets gas engines and pumps; also 3, laying pumping main (1,600 yds.), and sewer (850 yds.), for the U.D.C. Plans and specifications may be seen, and forms of tender, etc., obtained of W. E. Wollam, engineer to the council, council offices, London Road, East Grinstead, during office hours on deposit of postal order for £1. Tenders, on form supplied, endorsed as the case may be, to be sent by Nov. 28 to E. P. Whitley Hughes, clerk to the council. Tender accepted subject to sanction of the L.G.B. (See also "Building" and "Iron and Steel.")

Nov. 28. CARDIFF.—Provision of a two-cylinder vertical steam engine for the Cardiff Workhouse, in accordance with specification prepared by S. W. Allen, M.I.M.E., and conditions of contract annexed to the form of tender, to be obtained from A. J. Harris, Clerk, Union Offices, Queen's Chambers, Cardiff, and returned not later than 10 a.m. on Nov. 28.

Nov. 30. BALGOWAN.—(1) Building a reservoir tank of a capacity of about 60,000 gallons at Balgowan, Perthshire; and (2) for laying 1,860 yds. or thereby of steel water pipe from the site of the tank to Balgowan House. Offers must reach Tods, Murray, and Jamieson, W.S., 66, Queen Street, Edinburgh, by Nov. 30. Copies of specifications and forms of tender may be had from the above, and the plans may be examined in the hands of W. Coupar, New Row, Balgowan, adjacent to the site of the works.

Nov. 30. WOODNESBOROUGH.—Extension of the waterworks at Woodnesborough, Kent, for the corporation of the Sandwich Borough. Contract No. 1.—For supplying and fixing a suction gas plant and gas engine to drive pumping machinery. No. 2.—For supplying and fixing a set of three throw-deep well pumps, 8 in. diameter and 24 in. stroke, with the necessary gearing. No. 3.—For the construction of an engine house and gas producer plant house and coal store. No. 4.—For the construction of a service reservoir of concrete and brickwork to hold 140,000 gallons. No. 5.—For the laying of a 9 in. cast-iron pumping main 725 yds. long and short lengths of smaller main and the fixing of sluice valves. No. 6.—For the supply and delivery of about 725 yds. of 9in cast-iron main and 17 yds. of 7 in. cast-iron main. Pipes must be vertically cast; no tenders for pipes cast at an angle or horizontally will be considered. Copies of all or any of the specifications may be obtained, and plans seen at the offices of the town clerk, Sandwich, or at the offices of Anson and Shenton, engineers, 28, Victoria Street, Westminster, S.W., on payment of a cheque of £5. Tenders, marked "Waterworks Tender," must be received by E. C. Byrne, town clerk, Sandwich, Kent, before mid-day on Nov. 30.

Dec. 5. CRICCIETH.—Construction of tanks and other works, and providing and laying about 10,029 lin. yds. of 6 in. cast-iron pipes, 1,587 lin. yds. of 5 in. cast-iron pipes, 2,205 lin. yds. of 4 in. cast-iron pipes, and 609 lin. yds. of 3 in. cast-iron pipes, for the U.D.C. Plans and specifications may be seen at the town hall, Criccieth, or at the offices of E. Evans, A.M.I.C.E., engineer, 8, Castle Street, Carnarvon. Bill of quantities may be obtained from the engineer, on payment of £2 2s. Tenders, addressed to T. Jones, solicitor, Portmadoc, and endorsed "Tender for Waterworks," to be delivered not later than 12 noon on Dec. 5.

Dec. 7. LONDON, W.—Supply of Lancashire boilers and appurtenant works at the Hammersmith pumping station, for the Metropolitan Water Board. Forms of tender, conditions of contract, and specification can be obtained at the office of the engineer of the Western District, 41, Commercial Road, Pimlico, S.W., on the production of an official receipt for the sum of £10, which sum must first be deposited with the accountant at the Board's central offices, Savoy Court, Strand, W.C. Such payments and applications can be made on any weekday (except Thursdays and Saturdays) between the hours of 10 a.m. and 4 p.m. Tenders, addressed to the clerk, Metropolitan Water Board, Savoy Court, Strand, W.C., and endorsed "Tender for Lancashire Boilers, etc., Hammersmith Pumping Station," must be delivered in sealed envelope at the offices of the Board, not later than 10 a.m. on Dec. 7.

Dec. 11. SHEFFIELD.—Supplying and erecting complete an automatic or electric railway, telpherage or wire ropeway for conveying and tipping boiler refuse on the tip adjoining the power station, Club Mill Lane, Neepsend, Sheffield, for the Electric Light Committee. Full particulars, plan of site, general conditions of contract, and general conditions of tender may be obtained on receipt of a deposit for £1. Any person or firm sending in a tender will be required to add a schedule to such tender, stating the names of the various classes of labour which he or they intends or intend to employ, together with the place where such labour will be employed and the rates of wages, hours of labour and conditions of employment to be paid and observed in respect of each class of labour, all of which, as shown in such schedule, shall comply with the City Council's form of clauses respecting wages, hours, and conditions of labour, and prohibition against assigning or sub-letting. Tenders, endorsed "Contract No. 55," to be delivered at the offices of S. E. Fedden, general manager and engineer, Corporation Electric Supply Department, Commercial Street, Sheffield, not later than 10 o'clock a.m on Dec. 11.

Dec. 12. HARDWICK.—Sinking of two shafts about 225 fathoms each in depth and 21 ft. finished diameter on the Hardwick Estate, about 2 miles south of Horden Colliery, County Durham. Copies of the specification may be obtained from, and tenders must be addressed to, the Horden Collieries, Ltd., Castle Eden, Co. Durham, not later than Dec. 12. The lowest or any tender will not necessarily be accepted, and a deposit of £4 will be required from intending contractors.

IRON AND STEEL.

Nov. 26. BURNLEY.—Supply of steelwork required in the extension of storeroom at the Burnley Union Workhouse, for the guardians. Form of specification may be obtained from Keighley, architects, Nicholas Street, Burnley. Last day for receiving tenders Nov. 26, before 12 noon.

Nov. 28. CARDIFF.—Provision of two galvanised steel tanks, for the guardians of the Cardiff Union, in accordance with specification prepared by S. W. Allen, M.I.M.E., and conditions of contract annexed to the form of tender, to be obtained from A. J. Harris, clerk, Union Offices, Queen's Chambers, Cardiff, and returned not later than 10 a.m. on Nov. 28.

Nov. 28. BIRMINGHAM.—Supply of cast-iron pipes, special castings, etc., for the year 1909, for the Water Committee. Forms of specification, giving particulars as to the probable number of pipes of various sizes which will be required, can be obtained on application to E. A. Lees, secretary, 44, Broad Street, Birmingham. Tenders must be made out on the forms supplied, and must reach the secretary at latest by 12 noon on Nov. 28. Fair wages clause.

Nov. 30. HANDSWORTH.—Making and erecting about 3,000 yds of wrought-iron unclimbable fencing, etc., to be erected at the Leveretts Cemetery, Camp Lane, Handsworth, for the U.D.C. Conditions of contract, and drawings may be seen, and specification, bills of quantities, and form of tender obtained on application to H. Richardson, A.M.I.C.E., surveyor to the Council. Contractors will be required to deposit a cheque value £1 1s., for specification, bills of quantities, etc. All particulars may be obtained on application to the surveyor. Sealed tenders, endorsed "Fencing," to be delivered at the office of the surveyor, Council House, Handsworth, Birmingham, on or before noon on Nov. 30. Fair wages clause.

Dec. 1. LONDON, E.C.—Supply of: 1, cast-iron pot sleepers; 2, rails and fishplates, for the directors of the Bombay, Baroda, and Central India Ry. Tenders must be made on forms, copies of which, with specifications, can be obtained at the offices of W. V. Constable, secretary, Gloucester House, 2, 3, and 4, Bishopsgate Street Without, London, E.C., on payment of 21s. each (which will not be returned). Tenders must be received by Dec. 1.

Dec. 1. MERTHYR TYDFIL.—Supply and erection of the necessary steel work superstructure, consisting of steel troughing 27 ft. long by 12 ft 6 in. wide, with parapets to carry Hill's Plymouth Co.'s sidings over a proposed footpath near Pentrebach Station, Taff Vale Railway. Plans may be seen and particulars obtained upon application to the borough engineer, town hall, Merthyr Tydfil. Sealed tenders, endorsed "Pentrebach Subway," must reach T. A. Rees, town clerk, town hall, Merthyr Tydfil, not later than December 1.

Dec. 3. GLASGOW.—Construction of a steel footbridge over the Glasgow, Barrhead, and Kilmarnock Railway at Prince's Square, Strathbungo, for the Glasgow Corporation. Specifications and forms of offer may be had on application at the office of public works, City Chambers, Cochrane Street. Sealed offers, marked outside "Tender for Steel Footbridge," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than 10 a.m. on Dec. 3.

PAINTING.

Nov. 28. MANCHESTER.—General repairs and painting at various public urinals, for the sanitary committee. Specification and form of tender may be obtained on application at the city surveyor's office, town hall, Manchester, on payment to the city treasurer of £1 1s. All cheques or postal orders are to be made payable to the order of the corporation of Manchester. Tenders, enclosed in the official envelope and addressed "The Chairman of the Lavatories Sub-Committee," are to be delivered at the city surveyor's office not later than 12 o'clock noon on Nov. 28.

Dec. 1. BRIGHTON.—Painting and renovating the interior of the Chapel at the Workhouse, Elm Grove, Brighton, for the Guardians of the Poor. Copy of specification, conditions of contract, and form of tender may be obtained at the Guardians' Clerk's Office, Princes Street, Brighton. Sealed tenders endorsed "Tender for Painting and Renovating Workhouse Chapel" are to be addressed to B. Burfield, clerk to the Guardians, Parochial Offices, Princes Street, and delivered at his office on or before Dec. 1, by ten o'clock in the forenoon.

Dec. 1. LONDON, W.—Painting works in separate contracts at the offices, workhouse, and casual wards, for the Guardians of the Poor of the parish of Paddington. A copy of the specification and form of tender will be forwarded by E. H. Sim, architect, of Mowbray House, 14, Norfolk Street, Strand, W.C., on receipt of a cheque for £1. The contractors will be required to employ Paddington residents of twelve months' standing who are recommended by the Paddington Distress Committee or the Paddington Employment Exchange, unless the Board of Guardians shall give permission to the contrary. Sealed tenders, endorsed "Tender for Painting," must be delivered at the offices of the Guardians before 5 o'clock on Dec. 1.

Dec. 5. NOTTINGHAM.—Painting of two triple-expansion pumping engines, girders, pipes, and floor plates, etc., at Boughton pumping station, Ollerton, near Newark, for the Water Committee. Also, for painting the interior and exterior of Castle Works, Nottingham. Specifications and forms of tender may be obtained from F. W. Davies, water engineer, St. Peter's Church Side, Nottingham, on payment of a deposit of £1 for each contract. Sealed tenders, properly endorsed, to be delivered to J. A. H. Green, town clerk, Guildhall, not later than noon on Dec. 8 Fair wages clause.

PLUMBING & SANITARY

Nov. 27. NEWHILLS.—Executing about 2,570 yds. of drainage on the Home Farm of Sheddocksley, Newhills. J. Carnie, the tenant, will point out the ground and show specifications, and Chalmers, advocates, 18, Golden Square, Aberdeen, will receive offers up to Nov. 27.

Nov. 28. THORNTON.—Sewering of church and Occupation Roads, Thornton, for the U.D.C. Sealed tenders, endorsed "Sewering," to be addressed to the chairman of the Sanitary Committee, and to reach H. Fenton, surveyor, Council Offices, Thornton-le-Fylde, not later than Nov. 28. Further particulars may be obtained on application to the surveyor.

Nov. 29. LLANGADOCK.—Providing a water supply and renewing the drainage system at Abermarlais Park, Llangadock, in accordance with plans and specification prepared by the North-Eastern Sanitary Inspection Association, and which can be seen at Abermarlais. Tenders to be sent in to D. T. M. Jones, solicitor, Llandovery, by Nov. 29.

Nov. 30. LONDON, W.—Re-constructing the sewer in Brompton Square, Brompton Road, for the council of the Royal Borough of Kensington, in accordance with the plan and specification which can be inspected at the borough engineer's office, town hall, Kensington. Fair wages clause. Securities required. The contractor will be required to hold the council indemnified against all accidents, losses or damages arising in the execution of the contract, including all liability under the Workmen's Compensation Act, 1906, or any Act amending the same, and in connection with such indemnity will be required to take out a policy of insurance and to pay the premium thereon. Tenders, sealed and endorsed "Re-construction of a Sewer in Brompton Square," must be delivered at the office of W C. Leete, town clerk, town hall, Kensington, W., not later than 12 o'clock noon on Nov. 30.

Nov. 30. ROMFORD.—Construction of the following, for the R.D.C. (1) About 894 yds. of 9 in. stoneware pipe sewer in Slewins Lane, and 108 yds. of 6 in. sewer in Brentwood Road, Hornchurch. (2) About 358 yds. of 12 in. cast iron and stoneware pipe sewer in North-West Hornchurch. Contractors will be required to employ workmen who reside in the area comprised by the Romford R. and U. Districts only (foremen not included). Full particulars may be seen and form of tender obtained upon application to W. J. Grant, surveyor, Victoria Chambers, Romford. Sealed tenders to reach W. Smith, clerk, 13, North Street, Romford, not later than Nov. 30, endorsed "Tender for Sewerage Works, Hornchurch."

Dec. 4. CWMFELIN.—Construction of sewerage and sewage purification works at Cwmfelin, in the parish of Llangynwyd Middle, for the Penybont R.D.C. (Bridgend).—Contract No. 1 includes the construction of screening and detritus chambers, bacterial tanks, and continuous percolating filters, and the following sewers, with manholes, etc.:—Supplying and laying about 883 yds. of 9 in. stoneware pipes. Supplying and laying about 570 yds. of 6 in. stoneware pipes. Laying about 117 yds. of 9 in. cast iron pipes. Laying about 30 yds. of 6 in. cast iron pipes. Contract No. 2 includes the supply of cast and wrought iron work, manhole covers, ventilating columns, pipes, joists, valves and screens, etc. Plans can be seen and specification, quantities and forms of tender (which alone must be used) can be obtained from W. J. Davies, surveyor, Felin Fach, Tondu, upon payment of £1 1s. Sealed tenders, endorsed "Cwmfelin Sewerage," to be received by R. H. Cox, clerk, Union offices, Bridgend, not later than Dec. 4.

Dec. 10. WALSALL.—Laying and jointing of about 1,092 yds. of 12 in. and 1,486 yds. of 9 in. stoneware pipe sewers, in deep tunnel and open cutting; the construction of manholes and lamp-holes, screening and distributing chambers, septic tank, and the laying out of irrigation area, including carriers, sludge lagoons, and other works, incidental thereto, for the R.D.C. Plans may be seen, and copies of the specifications, bills of quantities, and form of tender obtained, at the office of W. P. Young, surveyor and engineer to the council, District Council Offices, Rushall, Walsall, on payment of a deposit of £5. Sealed tenders, endorsed "Streetly Sewerage," to be delivered to me at the office above named, not later than 12 o'clock noon on Dec. 10. Securities if required.

Dec. 10. UCKFIELD.—Construction of sewerage and sewage disposal works for the village of Buxted, for the U.D.C. The works comprise about 1,700 yds. of stoneware pipe sewers, from 6in. to 8in., all necessary manholes, flushing arrangements, ventilation, etc., a small pumping plant, with about 250 yds. of 4in. rising main, sewage and storm-water disposal works, tanks, percolating filter, and irrigation works, etc., in accordance with plans and specification, which have been prepared by J. Taylor, the surveyor to the Council. The drawings and specification may be seen at the office of the surveyor, Henley House, Uckfield, from whom copies of the bills of quantities, schedules of prices and forms of tender may be obtained on payment of the sum of £2 2s. Sealed tenders, endorsed "Buxted Sewerage Works," must be delivered at the office of F. Holman, clerk, 86, High Street, Lewes, on or before noon, Dec. 10. Tenders will not be considered unless they are on the form above referred to, with the quantities and schedules properly filled in.

ROADS AND CARTAGE.

Nov. 26. HARROGATE.—Private street works required in the back road at the rear of Nos. 1 to 37, College Road, for the corporation. The specification may be seen, and quantities obtained, of F. Bagshaw, borough engineer and surveyor. Tenders must be submitted not later than 9 a.m. on Nov. 26.

Nov. 28. THORNABY-ON-TEES. — Forming, draining, paving, curbing, flagging, and channelling of Roseberry View (part of) and Hannah Street (part of), for the corporation of the Borough of Thornaby-on-Tees. Plans and specification may be seen and copies of the bills of quantities obtained at the borough engineer's office, town hall. Tenders, on proper forms only, which will be supplied, and sealed and endorsed "Tenders for New Street," must be delivered at the Town Clerk's office, town hall, not later than 10 a.m. on Nov. 28.

Nov. 30. LONDON, N.—Constructing new roads at Muswell Hill, N. Plans, sections, and details can be seen, and a copy of the specification obtained, upon personal application to Vigers and Co., 4, Frederick's Place, Old Jewry, E.C. A deposit of 5s. will have to be made for each copy of the specification taken. Tenders to be delivered to C. J Hayter, 84, Temple Chambers, Temple Avenue, E.C., before 12 o'clock on Nov. 30.

Nov. 30. ROMFORD.—Kerbing, channelling, paving, and other incidental works in London Road, for the U.D.C., within their district. The plan may be seen, and specification, quantities and forms of tender obtained on application to H. T. Ridge, council offices, Market Place, Romford, on deposit of £2. Sealed tenders, endorsed "Tender for Street Works," must be delivered at the office of C. T. King, clerk, Romford, not later than 4 o'clock on Nov. 30 Securities required.

Nov. 30. WOMBWELL.—Supply during the year ending Dec. 31, 1909, of the following materials for the U.D.C.: 300 tons granite, 300 tons whinstone, 300 tons blue rock or limestone, 600 tons best dross or slag, 20 tons best Portland cement. Further particulars and forms of tender may be obtained from J. W. Harrison, surveyor to the Council. Samples of the materials tendered for will be required with all tenders. Tenders must be delivered to P. M. Walker, clerk to the Council, Town Hall, Wombwell, sealed and marked "Tender for Road Materials," not later than Nov. 30, at 12 o'clock noon.

Nov. 30. SLAITHWAITE.—Re-paving of portions of Britannia Road and Carr Lane, Slaithwaite, being the roadways over and approaches to Slaithwaite Bridge, within the urban district of Slaithwaite, for the West Riding C.C. General conditions, specification, and bill of quantities may be obtained from F. G. Carpenter, West Riding surveyor, County Hall, Wakefield. A deposit of £1 will be required. Cheques, etc., to be sent to the "West Riding Treasurer," County Hall, Wakefield. Sealed tenders, duly endorsed, to be delivered at the surveyor's office, not later than Nov. 30.

Dec. 1. LONDON, S.W.—Roadwork and plate-laying required for the electrification on the underground conduit system of traction of existing tramways, from the Britannia, Camden Town, via Chalk Farm Road, Ferdinand Street, Malden Crescent, Malden Road, Southampton Road, Fleet Road, Agincourt Road, and Constantine Road, to the Hampstead terminus, for the L.C.C. Full particulars, and also information as to the conditions to be observed by tenderers are given in the "London County Council Gazette," of Nov. 23. Tenders must be upon the official forms, to be obtained from M. Fitzmaurice, C.M.G., chief engineer of the council, at the County Hall, Spring Gardens, S.W., upon payment to the cashier of the council of the sum of £5 for the specification, etc. Full particulars of the work may be obtained on application at the County Hall before the payment of the fee for the specification, etc. No tender will be received after 11 a.m. on Dec. 1.

Dec. 3. SOUTHEND-ON-SEA.—Making up of Eastwood Lane (Section 2) in the Borough. Plans, sections and specification may be seen, and bill of quantities and form of tender obtained, on deposit of cheque for £1 1s., upon application to E. J. Elford, M.I.M.E., borough surveyor. Sealed tenders, endorsed "Eastwood Lane," to be delivered at the office of W. H. Snow, town clerk, Town Clerk's Office, Southend-on-Sea, before twelve o'clock noon on Dec. 3. No tender will be considered unless made on the prescribed form.

Dec. 3. SOUTHEND-ON-SEA.—Making up and improvement of Royal Hill in the Borough. Plans, sections and specification may be seen, and bill of quantities and form of tender obtained, on deposit of cheque for £1 1s., upon application to E. J. Elford, M.I.M.E., borough surveyor. Sealed tenders, endorsed "Royal Hill Improvement," to be delivered at the office of W. H. Snow, town clerk, Town Clerk's Office, Southend-on-Sea, before twelve o'clock noon on Dec. 3. No tender will be considered unless made on the prescribed form.

Dec. 5. CLEETHORPES.—About 800 tons of tar macadam, to be delivered at Cleethorpes Station, for the Cleethorpes-with-Trunscoo U.D.C. Tarred slag or granite macadam is preferred, and samples of materials, tarred and untarred, are to be submitted with tender. As the Council have decided that, in future, all streets are to be coated with tar macadam, they are anxious to obtain the best material, and they reserve to themselves the right to take the 800 tons from one or more firms for purposes of comparison as to wearing properties. Further particulars may be obtained from, and samples sent to, E. Rushton, engineer and surveyor, Council House, Cleethorpes. Tenders to be addressed to the Chairman of the Highways Committee, Council House, Cleethorpes, on or before Dec. 5, and endorsed "Tender for Tar Macadam."

Dec. 7. LONDON, S.W.—Making up and paving of the following new streets, viz.:—A. That part of Franciscan Road, Tooting, which lies between No. 102, Franciscan Road (inclusive) and the North Eastern boundary of No. 148, Franciscan Road, described as "Franciscan Road (3)." B. That part of Franciscan Road, Tooting, which lies between the North-Eastern boundary of No. 148, Franciscan Road, and No. 168, Franciscan Road (inclusive), described as "Franciscan Road (4)." C. That part of Effort Street, Tooting, which lies between Recovery Street and Hoyle Road. The specifications and drawings may be seen, and forms of tender obtained at the borough engineer's office, New Streets Department, 56, East Hill, Wandsworth, S.W., between the hours of 10 and 4 (Saturdays 10 and 12). Tenders, enclosed in separate sealed envelopes, and endorsed "Tender for Paving ——," must be delivered at the council house, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose, not later than 4 o'clock in the afternoon of Dec. 7. Securities if required. Fair wages clause.

Dec. 12. MAIDSTONE.—Supplying between April 1, 1909, and March 31, 1910, 65,000 tons (more or less) of broken road stones, such as:—1, Rhenish basalt; 2, Guernsey, Jersey, or Alderney granites; 3, Glee Hill basalt; 4, Leicestershire granite; 5, Penlee, St. Keverne, or other Cornish granites; 6, Penmaenmawr or other North Wales granites; 7, quartzite; 8, Norway granite; 9, quenast or lessines; 10, or other equally durable material. Also the following local materials:—3,000 yds. (more or less) of Sevenoaks rock, unbroken; 20,000 yds. (more or less) of surface-picked or grubbed flints; 2,000 yds. of Kent rag. Specifications and forms of tender can be obtained upon application to the county surveyor, Maidstone. Sealed tenders, endorsed "Tender for Road Metalling," must be sent to W. B. Prosser, clerk to the Council, Sessions House, Maidstone (upon the prescribed form) not later than 12 noon on December 12

MISCELLANEOUS.

Nov. 26. LONDON, E.C.—Supply of cast-iron tank pipes, etc., water cranes, jim crows, galvanised ridge capping, miscellaneous articles and materials, brass hinges, bolts, etc., for the Directors of the Great Indian Peninsula Railway Co Specifications and forms of tender may be obtained at the office of J. I. Berry, secretary, Company's Offices, 48, Copthall Avenue, London, E.C., on payment of the fee for the specification, which payment will not be returned. Tenders must be delivered in sealed envelopes, addressed to the secretary, marked "Tender for Cast Iron Tank, Plates, etc.," or as the case may be, not later than 11 o'clock a.m. on Nov. 26.

Dec. 3. GATESHEAD.—Supply during the six or twelve months from Jan. 1, of the following, for the Directors of the North-Eastern Ry.:—1, bar iron; 2, iron plates; 3, steel plates; 4, iron sheets and hoop iron; 5, steel sheets; 5a, corrugated iron sheets; 6, steel angles; 7, mild steel bars; 7a, special steel bars; 10, metal castings for engines; 11, metal castings (permanent way); 12, malleable castings (permanent way); 13, steel castings (permanent way); 14, steel fish plates; 17, cast-iron socket pipes; 17b, electric conduits and fittings; 18, rainwater goods; 19, steel and files; 21, steel tubes for locomotives; 22, brass and copper tubes for locomotives; 23, copper pipes; 24, copper (bolt); 28, lead (pipe and sheet); 29, white and red lead; 31, oils (paraffin and for gas making); 32, glass (sheet and plate); 40, iron washers; 41, nails; 42, screws (brass and iron); 45, hinges (brass and iron); 48 iron bolts and nuts and twisted spikes; 49, bolts, nuts and rivets; 50, cement (best Portland); 51, concrete and artificial stone flags; 52, flags; 53, stone; 54, whinstone; 55, limestone; 56, slag; 57, lime; 58, sanitary drain pipes; 59, common drain pipes; 60, chimney pots; 61, oak trenails. Forms of tender, specification, and conditions may be obtained on application to E. H. Clark, Stores, Gateshead, and tenders must be sent in to R. F. Dunnell, secretary at York, sealed and marked "Tender for Stores," not later than 9 a.m. on December 3.

Dec. 9. DOVER.—Supply of timber, bricks, lime, etc., iron and steel, steam, water and gas tubing and fittings, asbestos packing, etc., electrical sundries, paints, etc., paint oils, spirits, tar, etc., lead, glass, etc., oilman's stores, Portland cement, during the ensuing 15 months commencing Jan. 1, for the Harbour Board. Schedules and conditions of contract may be had on application at the office of M. Mowll, register of Dover Harbour, Castle Street, Dover, on payment of 2s. 6d. for each complete set of the whole of the schedules. Sealed tenders, marked "Tender for Materials," to be sent to his office on or before Dec. 9.

THE

Federated Employers' Insurance Association, Ltd.

HEAD OFFICES:

30, Cross Street, MANCHESTER.

Concerning Polychromatic Sculpture.

The practice of colouring sculpture was not a development, or refinement, brought about by progress made in the plastic art. On the contrary, the custom was established long before, for instance, Hellenic sculpture reached the zenith of its powers. Indeed, the use of colour to enhance the effect of sculptural representations is observable in many of the crude specimens of decorative enrichment and carving produced in the early days of most nations; and in the more barbarous ages of Greek art it was a common custom to paint or stain the statues of the national divinities. But the fact that among pioneers of ancient civilisations such as the Egyptians and Assyrians painting was largely symbolical, and the various colours they applied to their sculpture, therefore, conveyed a meaning which was, in all probability, clearly understood by the people at large, must not be forgotten. Thus, polychromy was not, as some writers have stated, first introduced by the Greeks, nor was it by any means exclusively employed by Hellenic artists, although there is no doubt it was extensively used in the best period of Greek sculpture. Professor Westmacott, who has dealt at some length with the whole question of polychromy in his well-known handbook of sculpture, says with regard to its use among the greatest sculptors of Greece, "If the arguments that can be adduced shall show, first, that where polychromy was employed it was either simply copied from other nations with whom the Greeks had come in contact; or that it was prescribed as a mode of hieratic or religious expression in statues and sculptured compositions that were to be placed in temples, or otherwise required for sacred purposes, and therefore it had a traditional standing; but that it was not employed generally by the best sculptors in works in which they were free to exercise their own unbiassed judgment, it will be consistent to believe that in the progress of sculpture, from a mere rude manufacture of idols to its perfection as an art which aimed at imitating *form* only in its most beautiful and simple aspect, colour was not considered essential, or even desirable; and that when it was employed it was exceptionally and, for some particular and especial reason, usually connected with architectural or merely decorative objects. The accumulation of rich accessories, and the profuse mixture of materials—ivory, gold, precious stones, and inlaying and painting—in the Olympian Jupiter, the Minerva of the Parthenon, and similar compositions, become, then, perfectly intelligible; and such works, though exhibiting also the most admirable art, will be considered rather in the light of splendid offerings to the honoured local deities, than as specimens of a rule which guided the sculptors of the greatest era of the art in their ordinary practice." It must therefore be taken into account that these works were essentially *religious* sculpture, and, as such, were no doubt treated in many respects according to a prescribed formula. There is no doubt that colour, although it may well have been used in connection with sculpture to inspire, or awaken, some special feeling of reverence for the carved representation which was thus adorned, was never intended to increase the *natural* aspect of the effigy. In support of this statement, it may be pointed out that in the instances in which colour has been applied over a thin undercoat of stucco it is, in the case of large statues, invariably of one uniform tint, although many small terra-cotta statuettes, reliefs, and vases have been discovered carefully decorated with paint of various colours. It is very fortunate that the application of colour to statuary was not universal in the golden age of Greece, because, in that case, the educational utility of many much-prized remains of Greek art, including the statues and reliefs of the Parthenon at Athens, would have been greatly depreciated, and their artistic value impaired, had they been covered with a coating of colour which would have rendered it impossible for their splendid natural surface treatment to be properly studied and appreciated by countless generations of artists.

A Plain Word from Wales.

Gallant little Wales is, without flattery, a most interesting country. One cannot keep away from it. Quite recently, as our readers are aware, it has furnished us with two delightful idylls. To make a third of equal charm, it would have to join the other two. So far as we are aware, however, that course has not yet been adopted. This time our interest in the Principality is stimulated in a different way. Gelligaer Urban District Council has "had a lively meeting." The only report of the proceedings that has come under our notice is, on the whole, rather obscure. But it contains one very plain word. The matter before the meeting was some question as to a proposed isolation hospital. The rector (we know not of what or of where) "did not think it advisable to have the 'pepper-box' class of building, and suggested one for each disease." It is useless to ask us, "One what?" We give it up. The chairman, however, seemed to understand what was meant, for he interjected that the rector would find a difficulty in getting sites. Why this onerous duty should devolve on the rector is not quite clear. But let us quote some more of the report: "The Rector (earnestly): There ought not to be difficulty in getting sites. If people who are responsible for the collecting together of an industrial community put difficulties in the way, then the whole thing—and I use the word deliberately—should be damned. Mr. Hammond seconded the rector's suggestion." The rector, being presumably a classical scholar, no doubt chose his condemnatory word with due regard for the primitive purity thereof. If he had not used it deliberately, but in the heat of debate, and without reflecting on its etymology, one might have been forgiven the suspicion that the "buildings that swear at you" must be prepared for an occasional return of the compliment, if they happen to profane the serene atmosphere of the rural district of Gelligaer. Nevertheless, the rev. gentleman's objection to the "pepper-box" style is inscrutable; his own exemplification of it being quite delightful.

Reckless Disregard for Red Tape.

The Local Government Board seems to be running short of red tape. It is actually in danger of becoming reasonable. It has "deviated into sense." It has recognised that circumstances alter cases. Some time ago the Leeds Corporation made application to the Board to vary the orders for the clearing of insanitary areas in the city, so as to relieve the Corporation from the necessity of building new houses to accommodate the tenants who are displaced. The existence of this clause has naturally hampered the work of clearing the scheduled areas. In practice it has been found to be unnecessary, because there are already many empty houses available in the locality. The Local Government Board, impressed with this argument, have so far varied the order as to permit the displacement of 2,000 tenants without building fresh tenements for them. Such an exhibition of plain common sense by a Government department is positively startling, and seems at first blush almost unconstitutional. It leaves one with a vague and uncomfortable dread of possible revulsion, with the president of the L.G.B. again hoisting his colours on board the grim "Inflexible."

R.I.B.A. and Measured Drawings.

We notice with some surprise that in an announcement with respect to the regulations as to students' measured drawings, the R.I.B.A. hint at the possibility of publishing such work at (presumably regular) intervals. Surely this were to pile Pelion upon Ossa. Facilities for the study of measured drawings are by no means rare. We would point to the collection at South Kensington, started, if we remember rightly, by Mr. R. Phené Spiers; to the existence of the Architectural Association Sketch Book, and to the publications of the Architectural and Topographical Society, and of the Society for the Survey of the Memorials of Greater London. Then there are the carefully selected examples appearing regularly in the "Architectural Review," in this journal, and in several other professional periodicals. In the circumstances, there does not seem to be any crying necessity for the R.I.B.A. to burden itself with an enterprise that must either be in the nature of a competitive trading venture or must amount to a tax on the Institute funds. If such work is being already done, as we think it is, abundantly and well, surely the Institute can find a more appropriate—we will not say a more dignified—outlet for its overflowing energies. If it continues to develop on such lines, it will be in no small danger of becoming "partly a trading concern." Such a reputation would not enhance its influence. Educative work is well within its province, and might legitimately take the form of publications if the accredited purveyors of such wares were in anywise lacking; but with respect to measured drawings the tendency, as we have shown, is rather towards superabundance, and we therefore trust that the R.I.B.A. will not be so ill-advised as to increase the glut. Where "to draw the line" is of the essence of the argument.

The Renovation of Rome.

Architects, archæologists, and artists, are shuddering at the contemplated rebuilding of Rome; and the man who happens to be all these things must suffer a threefold thrill that may well make him wish that he had hazarded fewer chances of æsthetic agony. It appears that in Rome the mania for town planning has become acute. The picturesque and venerable slums are to be swept away, and the narrow and tortuous alleys are to be superseded by broad and straight streets, perhaps—who knows, since Rome has been already more or less Americanised—to have, like the New York avenues, numbers instead of names, and steel-framed skyscrapers instead of marble palaces. The forlorn hope that, as some infinitesimally slight recompense for the destruction of so many relics of antiquity, the Italians might at least demonstrate the architectural possibilities of steel-frame construction is almost extinguished by the announcement that the scheme is to be entrusted, not to an architect, but to an engineer. When it is added that this engineer bears the ominously revolutionary name of Signor Saint Just, hope sinks to zero. But possibly these fears are exaggerated, even the "Times" correspondent who, last Saturday, set forth at considerable length some details of the project, admits that the plan, while it involves much that is deplorable and unnecessary, "might have been worse." The Via dei Coronari, which is marked for destruction, is filled with old Quattro Cento houses. It is narrow and dirty, but "it could be cleaned"—an expedient which does not seem to have occurred to the City Fathers. Apparently the thirteenth-century Castle of St. Angelo, which simply reeks with architectural and historical interest, is also in danger, and so are the numerous and extremely interesting houses in the neighbourhood of the church of San Giovanni dei Fiorentini; and a new wide road from the Via Porta Pinciana to the south side of the Villa Medici in the Pincio would probably, one may conjecture, see taxi-cabs and motor 'buses running through the gardens of the Villa, and through those of the Convent of the Sacred Heart. Of course there is a great outcry against these proposals; but the Roman municipality has a reputation for obduracy, and the worst is feared. But is it the worst? When sentiment and æsthetic feeling are opposed to convenience and social welfare, the more material consideration ought to prevail. If wholesale demolitions have become really necessary in Rome, it would be immoral to oppose them; and such relics as escape the hand of the really beneficent destroyer can then be enjoyed with a clear conscience. The new Rome may lose much of its interest for visitors, but it should gain immensely in the means of health and comfort for those who have to live in it. Reforming zeal can doubtless be carried too far; but so also can the enthusiasm for antiquity. If Signor St. Just can strike the middle course, he will be rewarded with the hearty execrations of both parties of extremists, but he will earn, even if he does not receive, the gratitude of the man in the street. If Rome is not to be regarded as an open-air museum of antiquities, but as a living and growing city, it will not be denied its "improvement schemes." But we could wish that they were entrusted to an architect rather than to an engineer. The International Congress of Architects will next take place in Rome, in 1911. In the meantime, there may occur such engineering innovations as "should move the stones of Rome to rise and mutiny."

Snubbed?

About the R.I.B.A. letters to the President of the Local Government Board, with respect to the Housing and Towns Planning Bill, which are printed in another part of the present issue, it would perhaps be unwise to say much at the present moment. Yet it is hardly possible to withhold the observation that there ought to have been no need to write them, and that the necessity for making them public is not conspicuous. As soon as the terms of Mr. John Burns's Bill became known, the R.I.B.A. very properly sent a deputation to wait upon him in order to express the views of that body. But apparently Mr. Burns was not feverishly anxious to avail himself of the invaluable assistance that the Institute was prepared to place at his disposal. Most legislators are wise enough to "consult the man who knows," but perhaps Mr. Burns honestly believed that he had already done this, and that as the man's name begins with a "B," any further information would be quite superfluous. At any rate, the publication of the letters addressed to him seems to indicate something like despair of catching him in a responsive mood. Whether it was wise to make public a correspondence in which it is rather amusingly evident that while "Barkis is willin'," the other party is either cold or exceedingly coy, is perhaps a matter of opinion. But, in any case, we do not believe that even the omniscient President of the Local Government Board can ignore with impunity the quite tolerably disinterested advances of so learned and influential a body as the R.I.B.A.

Labour Representation.

The right of a trade union to apply any portion of its funds towards securing or maintaining Parliamentary representation has been always keenly contested, and the objection is upheld in the judgment delivered by the Court of Appeal on Saturday last, in the case of Osborne *v.* the Amalgamated Society of Railway Servants. A final appeal to the House of Lords is by no means certain. After the very clear and decisive ruling of the Master of the Rolls and Lords Justices Fletcher Moulton and Farwell, the trade unions may well consider it hopeless to carry the case any further. They will probably prefer to address their energies to some internal reorganisation to meet the difficulty, or to some alteration of the existing law. In the meantime the position of the labour members, in being for the moment cut off from their supplies, is not enviable; especially with Christmas so near. Will they remain true to type, and strike in a body when their wages are stopped?

Our Christmas Special.

The special Christmas issue of THE BUILDERS' JOURNAL, of which the major portion must necessarily be prepared many weeks prior to the date of publication, is now sufficiently advanced to justify the confident belief that it will be even more successful than last year's "Edition de Luxe." As before, it will be a mammoth issue, but its value will again consist in its quality rather than in its mere bulk. In it the development of British architecture is sketched authoritatively and succinctly by Mr. Edward S. Prior, F.R.I.B.A., F.S.A., who deals with English Mediæval architecture; by Mr. J. A. Gotch, F.R.I.B.A., F.S.A., who treats of Early Renaissance; and by Mr. Mervyn E. Macartney, F.R.I.B.A., F.S.A., who gives a terse account of later Renaissance work. Modern work will be exemplified by buildings of 1908. Representative buildings of each period will be illustrated by what may be described without exaggeration as the finest collection of architectural examples ever brought together in a periodical publication. As last year's special issue was immediately exhausted, and copies of it are still being sought, and occasionally change hands at a high premium, and as, in our opinion, the new special will be a still more desirable acquisition, it is hardly necessary to urge our readers to take time by the forelock and send in their orders without delay; otherwise they will run the risk of missing a good thing. As the commercial success of the issue is already assured, we offer this advice solely in the interest of our regular subscribers, many of whom, we were sorry to find, were last year unable to procure a copy of the "Edition de Luxe." *Verb. sap. sat.*

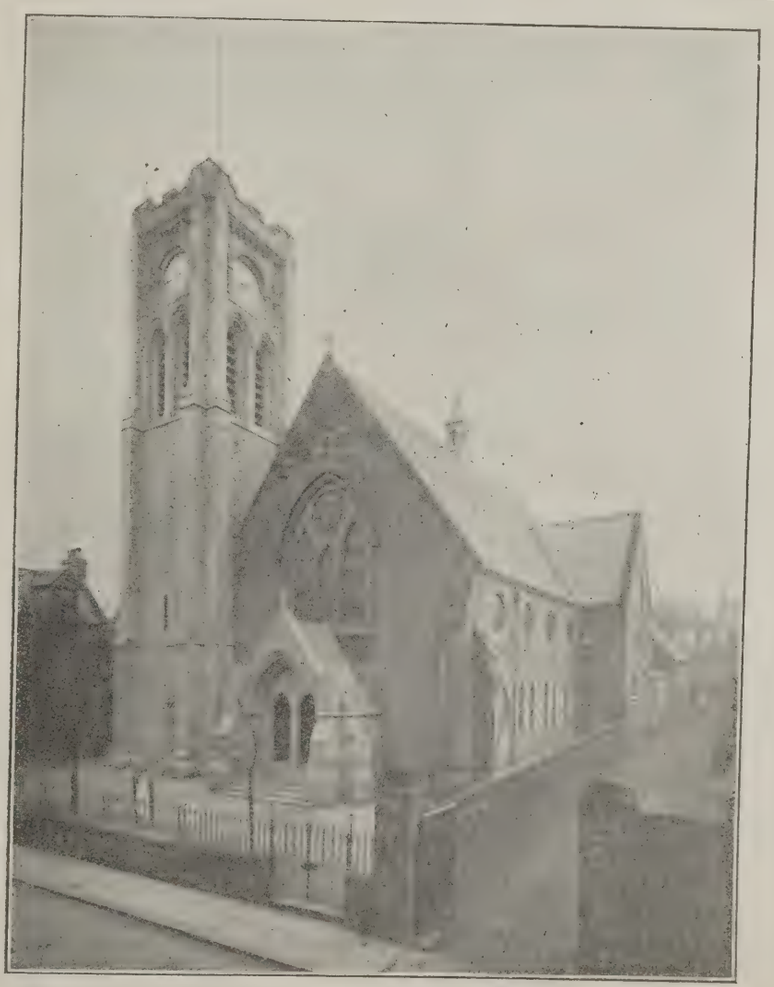
PROPOSED GUILD OF ARCHITECTS' ASSISTANTS.*

By E. J. Dixon, A.R.I.B.A.

The present-day practice of architecture differs in a striking manner from the conditions which exist in a trade or business. Architecture is primarily an art, and it involves the management of the work of the various trades concerned in the making of a building in order to produce the highest artistic result possible to the architect. This is architecture ideally considered; it means that the architect should be (and is, if he deserves the title of architect) the essential and primary factor; the artist, to whom all others are mere accessories. Unfortunately, however, for the successful existence of this ideal state of things, the profession of architecture is gradually becoming, or is actually, a prey to the spirit of commercialism, or mere business, in which the cash factor is predominant, and art runs a grave danger of being displaced from its primary importance and relegated to a secondary position. A struggle for the mastery is now proceeding between art and commercialism. This struggle involves the deterioration of architecture as such; it divides interests which should be united; and the gradual separation of the assistants' interests from those of the principal is one of the chief phenomena of this period of transition through which the profession of architecture is now passing.

Some fifty years or so ago, the assistant never considered his position in reference to his principal otherwise than as that of a transitory phase in his career, necessary to his professional and artistic training, "a tent in which to pass a summer's night," not a permanent resting place beyond which only a few favoured ones could travel. The chances of private practice gradually became more remote as the present day was approached, and public competitions, Government and municipal appointments became the goal of all but a decreasingly small number. Now, the position for the assistant is becoming more and more hopeless, and the sentiment is gradually being impressed on the whole class that the position of assistant is becoming a permanent one. The influx into the profession continues, however. The number of unemployed, it is generally agreed, has reached alarming proportions, and the amount of work in hand is not only less than ever but is collected into fewer hands.

As long as the assistant considers his status to be simply a passing necessary condition *en route* for a possible practice of his own in the future, none of these questions will affect him if he is the assistant to whom a certain section of the profession refer as being typical when anything is said of employment difficulties—that is, a gentleman having some private income of his own to live upon. But the truth must be told, and the obvious made clear—the great mass of assistants have no such resources to make use of in times of difficulty. The savings of a few years are all lost in a few months of unemployment. To assistants generally, the evils of unemployment, the tremendous difficulty of winning a competition, and the gradual loss of status due to falling salaries.



For it is very difficult, and involves enormous economy and mental ingenuity to maintain a professional status on thirty shillings or two guineas per week in a community where the "cash nexus" is the established criterion of position and professional dignty. All these matters are gradually impressing themselves on the minds of assistants, and they constitute a real danger to architecture, for they direct undue attention to the purely financial and business side of an assistant's responsibilities, and only the lapse of time is required to wear away the ideas and prejudices engendered by former conditions, to land the assistant very forcibly in the gulf of trade unionism, where financial matters come first and everything else nowhere.

That this is not a fanciful or theoretical picture, everyone acquainted with the change which has taken place in the prevalent ideas of assistants within the last fifteen years or so will agree. We all wish to avoid the risk of such a possibility as this. The R.I.B.A. and the Society of Architects are, as far as their consideration of the internal organisation of the profession is concerned, of interest only to principals (the latter, be it said to its credit, not so completely as the former); and the assistant has hitherto thought it necessary to engage in the positions taken up by these societies on account of the possibility and the hope he fondly indulged of at some future date becoming a principal himself. It is necessary for that interest to continue and increase, both in the interests of architecture and the profession.

The position now becoming more permanent, and involving less drafting of assistants into the ranks of principals, it becomes necessary and imperative to create a combination, a Guild of Architects' Assistants, for the consideration of questions which concern assistants especially, and to endeavour, by means of the strength that combination alone can give, to find solutions or palliatives to the questions or evils raised by present circumstances, and to endeavour to give effect to those solutions or palliatives.

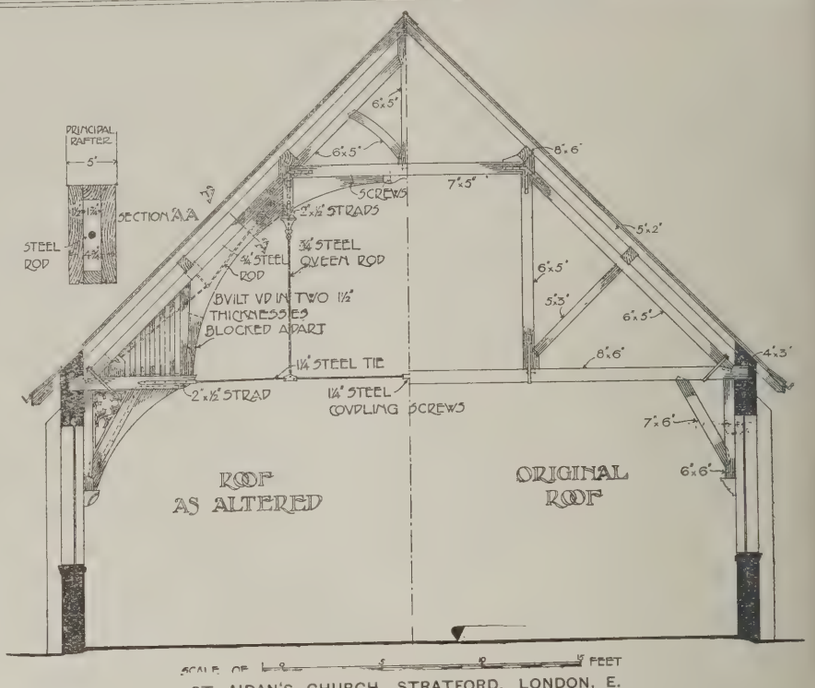
It is necessary that the membership of such a guild should include all architects who are really interested in the advancement of architecture and the progress and well-being of the assistant. The membership should be divided into classes according to capacity and experience, the subscriptions should vary in amount correspondingly, the benefit or probable benefit received by the member forming a determining factor. The questions which should concern the guild should be, primarily, the maintenance of a high standard of efficiency and inducements to its members to develop the art of architecture to the best of their ability. In this matter existing societies and all sympathetic architects should be invited to co-operate. The organisation of the business and financial side of the work of an assistant should command our next notice,

*Mr. Dixon's letter, in our issue of October 21st, urging the desirability of organising architects' assistants, has aroused so much interest that he now feels justified in offering these further observations on the subject

NEW TOWER AND PORCH, ST. ANDREW'S PARISH CHURCH, NORTH BERWICK. HENRY & MACLENNAN, ARCHITECTS.

a system of unemployed insurance, to suggest a scale of minimum salaries, to consider the position of the pupil and the improver in reference to the assistant's office hours and overtime, and overcrowding in offices. In all these matters there is much scope for improvement, which might be effected in quite a friendly manner if the proposed reforms were carefully considered and properly presented.

It is not an absurd or ridiculous matter for assistants to combine to consider and advance their own interests, and it is to the mutual advantage of the principal and the assistant to make use of and assist such a combination.



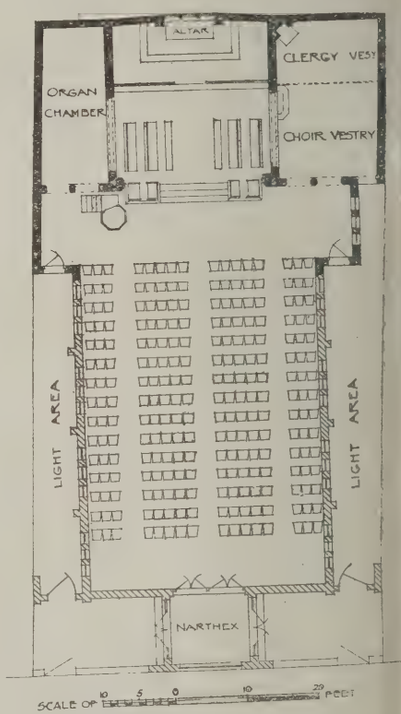
When an impartial assistant or practitioner reads, or hears, the writings or speeches of the architectural idealists at any of our societies, he is painfully conscious of a curious sense of detachment from the conditions which really prevail, and the remote position of the art of architecture from its present day practice. Such detachment is becoming more and more pronounced; and if our idealists are to continue their useful work they must find for it a field in which there is more earnest sympathy with their aims and objects, and they must take fuller cognisance of the inseparably sordid environment which menaces the artistic side of the profession, and they must come into closer touch with actual practice, so that they may be enabled to formulate their idealism in more accord with the greater knowledge thus gained. A Guild of Architects' Assistants would undoubtedly assist this object. Architecture without idealism and enthusiasm is dead. Idealism without deep and earnest sympathy and conviction becomes cant and hypocrisy. The danger of architecture at the present day is that of becoming the object of a canting idealism and the consequent prey of financial and business interests.

If architecture, and the organisation of the profession of architecture, is to see steady improvement and progression, it is only by means of such a guild that any such advancement can be brought about. None of us desire to see the assistant sink into the morass of trade unionism; and I can conceive of no other means to permanently benefit architecture and the entire architectural profession but that of a guild, in which all classes of the profession may meet for the discussion and settlement of all questions relating to the architectural assistant.

The Peterborough Cathedral Restoration Fund, which was started 25 years ago, has just been closed. The expenditure has amounted to £53,614, which has been raised by voluntary subscriptions; and, in addition, the special gifts for beautifying the cathedral have reached £20,000. The work has been carried on during the tenure of office of four deans and three bishops.

* * *

Mr. Alfred Gilbert's statue of Queen Victoria, which has stood for fifteen years in the Abbey grounds at Winchester, is to be removed to Winchester Castle, on the recommendation of Sir Edward Poynter, P.R.A., and Mr. Thomas Jackson, R.A., who state that the statue was never intended to remain out of doors, and that, facing the north, it is badly lighted. It is understood that Mr. Gilbert has consented to complete the statue in accordance with the original designs by adding two figures.



ST. AIDAN'S CHURCH, STRATFORD, LONDON, E.
SECTION SHOWING ALTERATIONS TO ROOF. BANISTER FLETCHER & SONS, ARCHITECTS.

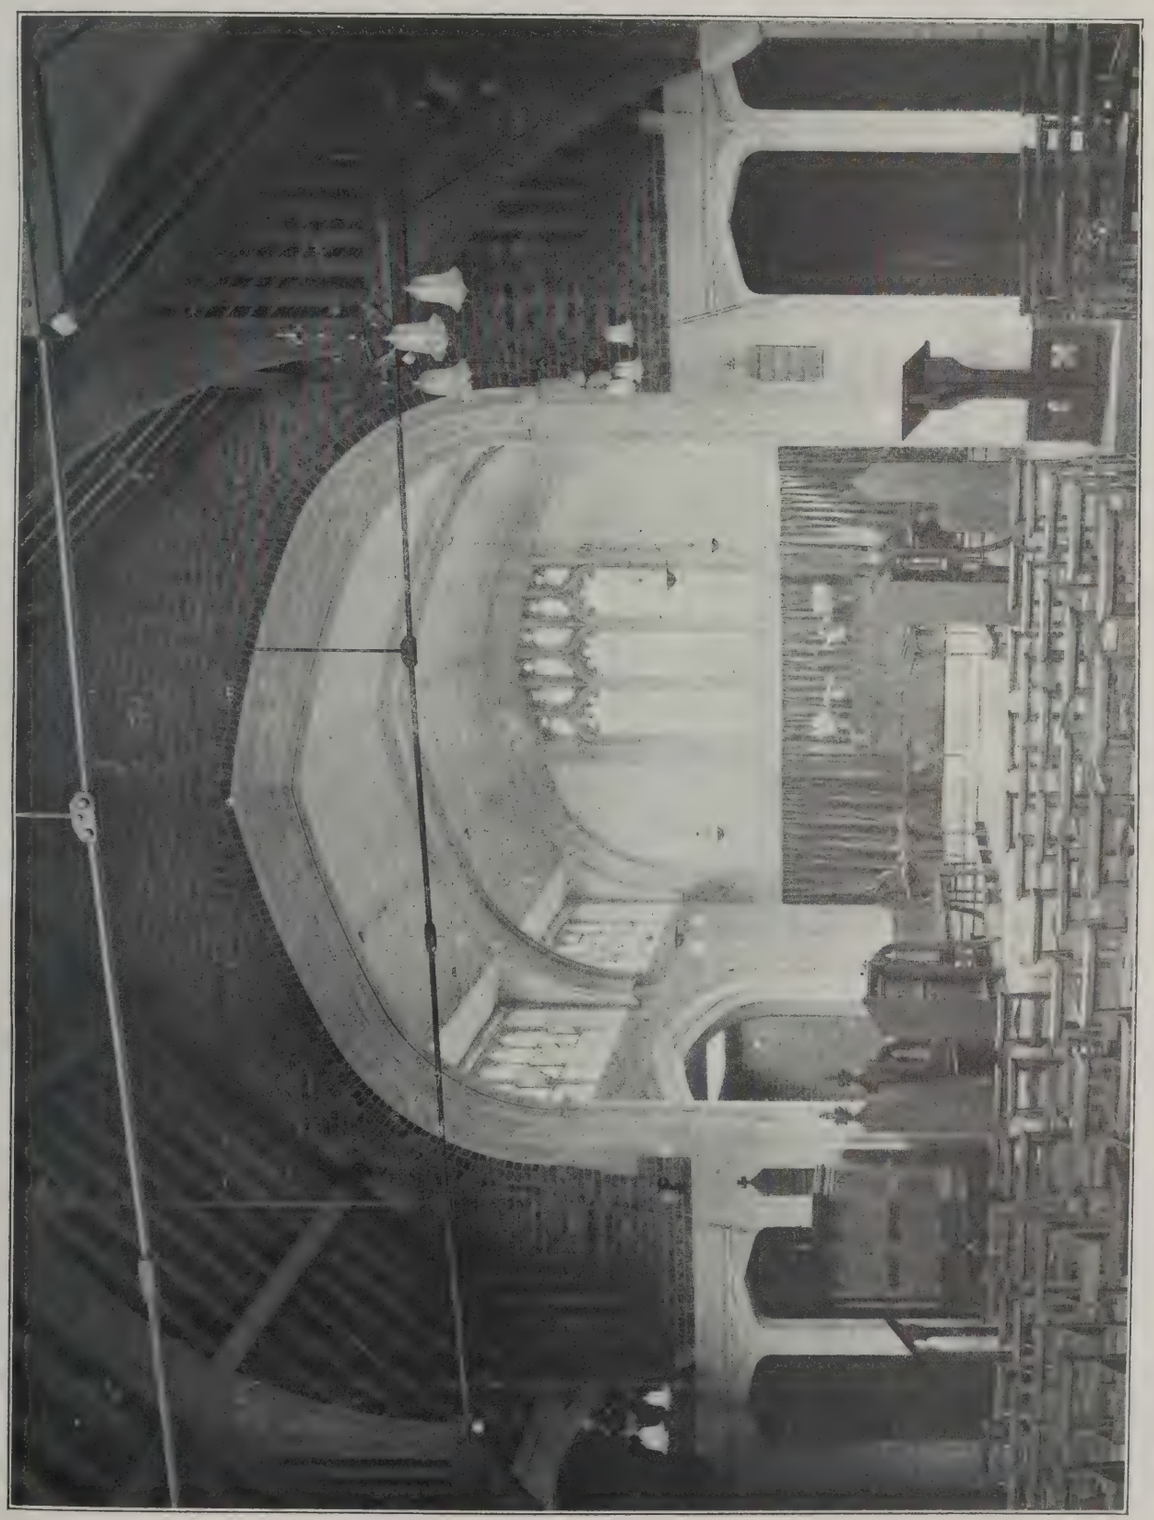
Our Plates.

St. Aidan's Church, Stratford, London, E.

The alterations shown by the views and plan consisted of the extension of the chancel and the formation of clergy and choir vestries and organ chamber. The interior was constructed of stock brickwork, and the arches of Bath stone. Owing to the fact that the chancel is at the extremity of the site, and that the east window may therefore at some future time be blocked up, light to the chancel is also admitted by means of a clerestory. The east window has symbolic subjects representing God the Father, God the Son, and God the Holy Spirit. The whole of the glazing was executed by Messrs. Harvey and Ashby, of Birmingham. The detail of the roof shows on the right side the original simple queen-post roof erected some years back. The left side shows the alterations effected by cutting away the tie-beam and queen-post and inserting tie rods, and the formation of the lower portion as a hammer beam truss. In order to do this, it was necessary to truss the principal rafter to support the lower purlin, the steelwork being hidden by the built-up curved braces as shown in section. At the same time, the top of the queen-post had to be left, and this was treated with a pendant moulding. In addition to this a king-post and struts were added to the upper part of the truss. The general contractor was Mr. A. E. Symes, of Stratford. The whole of the works, including the pulpit, reading desks, and electric-light fittings, were designed by the architects, Messrs. Banister Fletcher and Sons, 29, New Bridge Street, E.C.

Red tape certainly appears to be at a growing discount with the Local Government Board. At a recent meeting of Fleet District Council, it was announced that a loan of £600 for making up roads had been sanctioned without holding the usual preliminary enquiry.

ST. AIDAN'S CHURCH, STRATFORD, LONDON, E. PLAN.
BANISTER FLETCHER & SONS, ARCHITECTS.



Mr. A. Wyatt Papworth, A.R.I.B.A., of the firm of Lovegrove and Papworth, Town Hall Chambers, 374/8, Old Street, E.C., has been appointed surveyor to the licensing justices of the Paddington Division.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Dec. 14	BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos, Town Clerk, Town Hall, Blackpool. Deposit £1 1s.
Dec. 19	WHITTINGHAM. ANNEXE TO ASYLUM FOR PAUPER LUNATICS, for the Lancashire Asylums Board. Limited to Architects who are in practice and are ratepayers in the County of Lancashire. The new building is to accommodate 700 Inmates. Premiums of £100, £50, and £25. Particulars and plan of site from Leonard Colman, Law Clerk to Committee of Visitors, 8, Lune Street, Preston. Deposit £5 5s.
Dec. 31	*CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50, £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council, Bodmin. Deposit, £1 1s.
No date.	SWINTON. New Schools in Cromwell Road for the Swinton and Pendlebury U.D.C. Limited to Architects having offices within ten miles of Manchester. Premiums of £50, £25, and £10. Instructions may be obtained by letter on or before November 5th, to W.T. Postlethwaite, Council Offices, Swinton, Manchester.

* *This competition has been unfavourably reported upon by Correspondents.*

Proposed Public Shelter and Promenade, Whitley Bay, Northumberland.

In the competition for the above, thirty designs have been received, and these were on view at the Council Chamber, Whitley, on November 23rd, 24th, and 25th. The invitation issued by the Whitley and Monkseaton U.D.C. was for designs for a public shelter with seating accommodation for 1,000 people, with promenade space for another 400, the cost not to exceed £1,200; yet the majority of the designs submitted were for two-storey concert halls and pavilions, which could not be erected for double the sum stipulated. Some of the designs were decidedly poor, whilst others were far too elaborate and fussy. We understand that the Council have already decided on one of the designs, and the author's name will be made known at the next Council meeting.

Town Hall, etc., South Bank-in-Normanby.

We have received from a correspondent in the North the conditions for a competition for the erection of a new Town Hall, Market Hall, Council Offices, etc., for the South Bank-in-Normanby Urban District Council. Our attention is drawn to the first paragraph which deals with premiums: — "The architect whose plans are selected and approved by the Council will be employed to carry out the work, for which he will be paid a commission of five per cent. on the amount of the builder's contract (exclusive of furniture), such commission to include the preparation of plans, quantities, and specifications—revising same if necessary, preparing copies of plans for the Local Government Board, making working drawings, sketch plans, estimates, waiting on meetings of committees or council, granting certificates, supervising the work, travelling, and all other out-of-pocket expenses." So far from the Council paying premiums, they expect the architect whose plans are selected to provide the quantities as well as the plans and specifications, and he has also to find all travelling and out-of-pocket expenses on the bare five per cent. We need hardly say that our readers would be well advised to have nothing to do with the South Bank-in-Normanby competition.

Garden Designing Competition at Letchworth.

A competition for garden designing has recently been promoted by the First Garden City, Ltd., Letchworth. A large number of designs were submitted, and the following are the awards made by Mr. Robert Harkness, Hitching; Messrs. Kelway and Sons, Langport-Somerset; and Messrs. Mawson Bros., Windermere, who acted as judges:—Class I., David Smith, Wormit-on-Tay, N.B. Class, II., W. H. Johns, 5, Mortlake Terrace, Kew, Surrey. Class III., 1st, M. and A. R. Wilson, River Lodge, Harpenden; 2nd, F. J. Landsell, Dexford, Leicester. Class IV., 1st, Cayley and Rochester, Rothwell, Kettering; 2nd. Miss Louise A. Dunington, Belgravia Chambers, Victoria Street, S.W. The designs were on view in the Howard Hall, Letchworth, from November 16th to 21st, and the Horticultural Society have also arranged for them to be exhibited in the Horticultural Hall, Vincent Square, Westminster, on December 8th.

Architectural Societies.

R.I.B.A.

For some months past a scheme has been under consideration by a committee of the Institute, its object being to co-ordinate and systematise the measured work done by candidates as testimonies of study for admission to the final examination, and by competitors for the measured drawings prize. The proposals were first brought before the Literature Standing Committee, and having been referred to a sub-committee and favourably reported upon, the sub-committee, with other members added, was permanently established to thrash out details and give practical effect to the proposals. The committee, which is to be known as the Records Committee, R.I.B.A., consist of the following members of the Institute:—Professor W. R. Lethaby (F.), chairman Messrs. Alexander Graham, F.S.A. (F.), Halsey Ricardo (F.), R. Phenè Spiers, F.S.A. (F.), D. T. Fyfe (F.), Walter Millard (A.), W. Curtis Green (A), hon. secretary, S. K. Greenslade (A.), A. J. Stratton (A.), and two non-members, Messrs. Philip Norman, F.S.A., and R. Weir Schultz. Under existing conditions much excellent measured work is done which, through want of system and proper direction, is often of little permanent value. Measured drawings, for instance, are repeatedly made of the same buildings, or of buildings of which authentic record already exists, or, again, of buildings of insufficient architectural or historic interest. It is desirable, too, that a student who has done a certain amount of measured work of a building in his testimonies of study for the final examination should be encouraged to proceed wth further work on the same building if he intends later to enter for the measured drawings medal. In this way continuity of study as well as of record would be preserved.

With the view of directly aiding the student in his choice of building, and indirectly of gradually forming a measured record of the buildings of the United Kingdom, the committee have decided to prepare an extended list of old buildings suitable for study, and especially of those of which no adequate record exists. In order to make this list as complete as possible, the committee are inviting the allied societies and other bodies to assist in its compilation, and they are seeking also the co-operation of individual members of the Institute and others who have special knowledge of buildings of particular districts. It is proposed to include in the list ecclesiastical, civic, or domestic buildings of any period, and information will be given, where necessary, as to their position and character as well as to their accessibility for the purposes of study.

The manner in which the record of such work should be preserved may possibly take the form of publication of specially chosen drawings at stated intervals.

Architectural Association.

At the conversazione held at 18, Tufton Street, Westminster, on November 25th, the guests were received by Mr. Walter Cave (the president) and Mrs. Cave. The members and guests present were about 650 in number, and included Sir George and Lady Frampton, Sir Edward Ward, K.C.B., Sir A. Brumwell Thomas, Mr. Ernest George, P.R.I.B.A., Mr. Leonard Stokes, V.P.R.I.B.A., Mr. E. Guy Dawber, F.R.I.B.A., etc.

The A.A. Orchestral Society, conducted by Mr. Harry E. King, and the A.A. Choral Society, conducted by Mr. P. W. Pocock, jun., provided an interesting programme of music. The exhibits comprised drawings and sketches by Mr. W. Curtis Green and Mr. C. Wontner Smith; china, glass, and ivories, lent by Sir A. Brumwell Thomas, Messrs. R. S. Balfour, Walter Cave, E. Guy Dawber, Ernest George, H. Tanner, jun., J. J. Joass, Percy May, Maurice E. Webb, and W. Wonnacott. Tapestries and china were shown by Messrs. Martin Van Straaten and Co., Masonic china by Mr. W. J. Songhurst, ancient paintings by Indian artists by Mr. Edward Thornton, Lancastrian lustred pottery by Messrs. Pilkington's Tile and Pottery Co., sketches by the late Mr. Hugh Stannus, and the following exhibits lent by Mr. A. H. Ryan-Tenison: Model of three decker in ivory, made at Dartmoor by one of the French prisoners taken at Trafalgar. Japanese, Chinese, and Indian exhibits; specimens of Crown Derby china of the Billingsley period, and sixteenth century china dishes. In the School of Architecture there was an exhibition of students' work, as well as photographs and sketches taken on the Belgian excursion and by members of the Camera and Sketching Club.

At the ordinary general meeting on November 20th, Mr. Wontner Smith read the minutes of the last two nominations for membership. The President (Mr. Walter Cave) then read the following names of candidates for membership: — N. Kitchen, proposed by Hon. Secs (by order of the Council); A. G. Humphrey, proposed by H. P. G. Maule and W. A. Forsyth; J. C. E. Henslow, proposed by J. O. B. Hitch and J. A. Cheston. These gentlemen were unanimously elected.

Halifax Architectural Society.

The annual dinner of this Society was held at the Old Cock Hotel on November 20th, the president, Mr. C. J. Fox, in the chair. The Society, he said, was in its infancy and at present numbered only about thirty members. When he first came to Halifax as a pupil there were only five architects practising in the town. The young architect of those days was thrown on his own resources, but managed to worry through and get well grounded.

THE CONCRETE INSTITUTE.

At the first general meeting of this Institute, which was held at the Royal United Service Institution, Whitehall, on November 19th, and of which brief particulars were given in last week's issue, Sir Henry Tanner, I.S.O., F.R.I.B.A. (principal architect, H.M. Office of Works), vice-president, was in the chair.

Mr. Edwin O. Sachs, F.R.S.Ed., chairman of the executive, having been called upon to make a statement as to the progress of the Concrete Institute, which was founded in July last, gave the following particulars:—The Institute, which was started with 100 founders, already had a list of members exceeding 300, of whom more than a hundred were members of the Institution of Civil Engineers, and twenty-five represented various Colonies. The Institute had as its president the Earl of Plymouth, C.B., until lately First Commissioner of Works, and as its vice-presidents, besides Sir Henry Tanner, Sir Douglas Fox, Kt., J.P. (past president of the Institution of Civil Engineers), Sir William Mather, Kt., J.P., LL.D., M.Inst.C.E., etc., and Sir William Preece, K.C.B., J.P., F.R.S., LL.D. (past president of the Institution of Civil Engineers).

The objects of the Institute might be summarised as follows:—(a) To advance the knowledge of concrete and reinforced concrete and direct attention to the uses to which these materials can be best applied; (b) to afford the means of communication between persons engaged in the design, supervision, and execution of works in which concrete and reinforced concrete are employed (excluding all questions connected with wages and trade regulation); (c) to arrange periodical meetings for the purpose of discussing practical and scientific subjects bearing upon the application of concrete and reinforced concrete, and to conduct such investigations, and to issue such publications as may be deemed desirable. Mr. Sachs then went on to say that the great necessity for this Institute might perhaps best be gauged from the fact that the number of technical questions and suggestions made to its Council immediately upon formation had been simply enormous, and of such a scope as to require enquiry, research, and investigation for years. It was to be hoped, Mr. Sachs added, that the British public authorities concerned will find it advisable to contribute in some way towards the expense of the research work necessary. In America, the United States Government had already contributed £25,000 for research work in this direction, while the German authorities had contributed £20,000 towards research in reinforced concrete alone.

The Chairman (Sir Henry Tanner) expressed his confidence that the Institute would take an important place among the scientific bodies of the country.

Mr. Marsh's Paper.

Mr. Charles F. Marsh, M.Inst.C.E., assistant-engineer, Metropolitan Water Board, was then called upon to read his paper, entitled, "The Composition and Uses of Plain and Reinforced Concrete." The so-called natural cements, Mr. Marsh said, were very uneven in their composition, since the chemical constituents are not carefully proportioned as is the case with Portland cement. Natural cements were, it is to be feared, sometimes placed on the market as Portland cement, and care should be taken, when Portland cement was specified, to ensure that the proper material was supplied. The manufacture of Portland cement had been very greatly improved within recent years. The materials were scientifically proportioned, and all the processes of manufacture were carefully supervised. The improvement had been largely brought about by the gradual development of a thorough system of testing, but it was also due in a very great measure to the scientific study of the material by the manufacturers, most of whom have trained chemists on their staffs. It was, in fact, owing to the intelligent co-operation of engineers and manufacturers that the artificial Portland cement of to-day was an infinitely more reliable material than it was formerly.

Cement has within recent years been considerably improved by the finer grinding obtained by the introduction of tube mills, and at the present day it is quite usual to obtain a cement which will leave less than 15 per cent. residue on a 180 sieve. Generally speaking, the finer the grinding, or, rather, the greater the percentage of impalpable powder, the stronger will be the mortar or concrete made from a cement. This increase in the strength of mortars and concrete due to the fineness of the cement will be shown by the behaviour of the sand briquettes, the tensile resistance of which increases with the fineness of the cement used.

Mixing of Concrete.

In regard to the mixing of concrete, Mr. Marsh lodged a protest against the not unusual practice of defining the proportions as 1 to 4, 1 to 6, etc., which gave no indication of the relative quantities of sand and stone. Such a definition was only permissible when using a ballast or unscreened broken stone, and in such a case it should be clearly specified that a proper quantity of sand should always be maintained in the aggregate, either by the addition of further sand or the screening out of a surplus. Definite proportions of cement, sand, and stone should always be adopted for the best classes of concrete. It was probable that before long the old method of proportioning by volumes of cement, sand, and stone would be superseded by the proportioning by weight of cement to volumes of sand and stone. This appeared to be the rational method, since the cement was sold by weight, and it therefore seemed to be only reasonable that it should be proportioned by weight. It was impossible always to obtain the same amount of cement in gauge boxes, as the method of filling had a considerable effect on the quantity. The contractor carrying out any works had a much better control on the amount of cement used when it was proportioned by weight, while the engineer or architect was sure of obtaining the proper quantity. As a rule, machine mixing gave a more even concrete than hand mixing if "batch" mixers were used.

Aggregates.

The nature of the aggregates in concrete depended in a great measure on the locality, but it was an undoubted fact that, all other things being equal, the harder the aggregate the better the concrete. For some purposes, such as for reinforced concrete, which may be subjected to fire, certain aggregates should be avoided. Crushed limestone, for instance, would disintegrate when subjected to heat, and should not be used for fire-resisting structures. It was better to avoid the use of flints, if possible, when fire resistance is a desideratum, and if they are used it was advisable to break them, since they will break on the lines of cleavage, and the broken pieces will consequently have less tendency to fly.

Consistency.

The question of the proper consistency of concrete had received a good deal of attention since reinforced concrete became a recognised structural material. In the early years of the use of this material very dry concretes were almost universally employed, but at the present time it had become the almost universal practice to use a somewhat wet mixture, and some constructors favoured a quite sloppy consistency. It appears that, as usual, the mean was the best, as although a dry mixture, very thoroughly rammed, gave the strongest concrete, the ramming is likely to be shirked, and in any case the steel of reinforced concrete was not so well protected by a dry as by a moderately wet concrete, which required only moderate ramming.

Waterproofing.

The proper waterproofing of concrete structures was becoming a question of great importance. The extended use of concrete block and reinforced concrete construction forced us to consider seriously the provisions which might advantageously be taken to secure concrete from the penetration of water. Many materials, both natural and manufactured, had been employed as ingredients in the concrete with more or less success, and under small heads were undoubtedly beneficial so long as the concrete did not crack, but as soon as a crack existed it was evident that such ingredients were useless as preventatives to the penetration of moisture.

Protection of Steel.

A doubt still remained in some minds as to the adequate protection of the steel against oxidation in reinforced concrete structures. Personally, the lecturer was convinced that, provided the concrete was of a dense nature, such as was always used for reinforced concrete, was not mixed too dry, and was well worked around the reinforcements, there need be no fear that the steel would become oxidised.

Nature of Reinforcing Metal.

The advantage or otherwise of high carbon steel as a reinforcement was a question which might be expected to raise some discussion; personally, he was of the opinion that when employed in members subjected to bending the small advantage gained by its use when relatively small unit moments of resistance were required was counterbalanced by the probability that the highest stress allowed in the steel will cause the concrete on the tensile side to crack. With the higher percentages of reinforcement, when the compressive resistance of the concrete became the ruling factor, there could be no advantage in the use of high carbon steel.

For compression members of the ordinary construction even mild steel could not be stressed to its allowed limit; for such members, therefore, there could be no advantage in the use of high carbon steel. For hooped members, if the allowable compressive stress in the concrete was higher than about 1,000lbs. per sq. in., it was advisable to use high carbon steel for the longitudinal reinforcements, and the employment of high carbon steel for the bindings was always advisable. For the purpose of resisting temperature stresses there was an advantage in the use of high carbon steel, as its greater resistance would enable it to offer more assistance to the concrete.

Form of Reinforcing Bars.

The advantage of the use of deformed bars was another subject which would doubtless raise discussion. There was no

doubt that deformed bars offered more resistance than plain bars against sliding through the concrete, but the real question appeared to be whether plain bars offered sufficient resistance, as if such was the case there could be no real advantage in the employment of deformed bars, especially if they were more costly.

Mesh Reinforcements.

The Institute might well carry out some experiments to ascertain definitely the relative merits of various mesh reinforcements, and of plain rods either loose or tied at the intersections for reinforcing slabs. Tests might also be made to ascertain what increase of resistance is effected by placing the mesh reinforcements diamond-wise, so that they may have a tendency to close up under tensile stresses.

Test Loading.

The Institute might express its opinion as to the percentage of the super-imposed loading which should be used in applying test loads to a finished structure, the position of its application on various types of floors, etc., and the period which should be allowed to elapse before a structure was tested.

Architectural Rendering.

The subject of concrete surfaces and the architectural treatment of concrete structures generally was one which must be of extreme importance before long, and this Institute will doubtless render valuable aid in adapting this material to architectural uses. It could not be doubted that before very long engineers and architects generally would take up the design of the structures they wish to erect in reinforced concrete, or would entrust the design to specialists other than the firms constructing in the various "systems." It was to be hoped that these firms would adapt themselves to the new conditions and become specialists in a broader sense than they were at the present time. They occupied a very advantageous position with regard to the designing and carrying out of reinforced concrete works, having considerable experience of the practical methods of construction. With reinforced concrete, perhaps to a greater extent than any other structural material, the practical considerations of construction influenced the scientific and economical design. It could not reasonably be expected that reinforced concrete would remain a multitude of various more or less rational systems relving on more or less valid patents. If such were to be the case, it was to be feared that its employment would be seriously affected. This method of construction was not, and could not be, split up into defined systems, it must be adapted to the requirements of each case in the best manner possible; and while all honour was due to those men who, as proprietors of the various systems, had undoubtedly borne the labour and heat of the day, it was to be sincerely hoped that they would not try and hinder the advancement of this very excellent method of construction by petty disputes, but would come to take a broad view of the whole question. The lecturer was sure that it would be to the great advantage of all concerned when the various systems were merged into one, and reinforced concrete took its proper place as a method of construction which, by reason of its great adaptability, could be employed for a vast number of different types of construction. It was certain that there would be no lack of work for specialists if this broader view were taken, and they undertook the design and construction of works in reinforced concrete without restricting themselves to their one particular system.

Standardisation of Symbols.

This Institute will probably enquire into the standardisation of the symbols used for the calculations of reinforced concrete structures. It was unfortunate that so many systems of symbols should be used by various authors, and the lecturer was afraid that some might consider that he was one of the chief sinners in this respect. With such a subject as reinforced concrete the matter of proper symbols was one which required very careful consideration. There were so many different symbols required that the available alphabets were hardly sufficient for the purpose, and when trying to deal with the calculations in a complete manner one sometimes wished the Chinese alphabet were universally understood, as it might come in very handy when the Latin and Greek letters were all used up.

Discussion.

In the ensuing discussion, Mr. Wentworth Shields said that, notwithstanding the excellence of Portland cement, lime concrete should not be despised. Lime concrete was very successful in the Egyptian barrages. He mentioned that reinforced concrete had been in use at Southampton for nine or ten years, and was, on the whole, highly satisfactory, although there were occasional instances of oxidation.

Mr. Meik said that he had known only one instance of moisture affecting the metal, and that was where gravel had been used for the aggregate.

Mr. H. H. Statham urged that, architecturally, concrete should not be treated like masonry, but as a monolithic material. Some kind of treatment that was natural to the material should be evolved out of the construction.

Mr. B. Blount, Mr. H. G. Bamber, Sir John Cockburn, Mr. W. T. Hatch, Mr. D. B. Bulter, and the Chairman also took part in the discussion, and, votes of thanks to the chairman and the reader of the paper having been passed, the meeting came to an end.

The addition to the Law Courts in the Strand, London, upon which work has just been commenced, is expected to cost at least £95,000.

* * *

Mr. Walter Reynolds, of the London County Council, presided, on November 26th, at the London Hippodrome, at a demonstration of an apparatus for extinguishing fires in cinematographs. The device consisted of a tank containing water, to which was attached a piece of metal tubing, which in its turn held a sprinkler immediately over the drum upon which the film was wound. Connecting the tank and cinematograph was a piece of cotton, which, in the event of a conflagration, ignites, and automatically releasing a valve, causes the flame to be extinguished. Two films were set alight in succession, the apparatus acting satisfactorily in both cases. A heated discussion ensued, in the middle of which a rival invention was introduced, the originator immediately commencing to lecture upon its virtues. Mr. Reynolds brought the demonstration to an end by observing that he was there in the public interest only, and was perfectly willing to witness tests of any invention upon the market. By the courtesy of Mr. Oswald Stoll, the Hippodrome had again been placed at his disposal, and any gentlemen desirous of having inventions tested should communicate with Mr. Allan at the theatre.

THE ARCHITECT'S CERTIFICATE: SOME LEGAL ASPECTS.*

By A. M. Brice.

(*Continued from page* 412, *No.* 720).

II.—The Conclusive or Final Certificate.

Assuming that the architect is not unqualified to act in a quasi-judicial way and give a certificate, and assuming that he is the person designated by the contract to give the certificate (when the certificate of more than one architect is required, a certificate by one will not suffice), see Lamprell *v.* Billericay Union [(1849) 3 Ex. 282; 18 L. J. Ex. 282], and that he has received power to certify regarding the subject-matter of his certificate, that the power is still in existence, and that the certificate is shown by the contract to be intended to be binding on both parties, Robins *v.* Goddard [(1905), 1 K.B.D. 294], it will now be convenient to tabulate the various conditions which will have to be secured before the certificate is rendered final and conclusive.

I. The final certificate must not merely contain evidence that it is intended to be final, but must be in fact final [Robins *v.* Goddard, 1905, 1 K.B. 294] Thus, in the well-known case of Robins *v.* Goddard, it was held that though the architect had given a certificate which purported to be final, yet a clause in the building contract which provided for any dispute or difference being referred to arbitration, with power to the arbitrator to open up, review, and revise any certificate or notice and determine all matters in dispute, effectually destroyed the finality of the certificate. The certificate purported to be conclusive, but was in fact subject to revision. Consequently it was not binding, not conclusive, and therefore not final.

II. The final certificate must deal with a matter demanding judgment and skill, *i.e.*, it must not be a mere ministerial act [Stevenson *v.* Watson (1879), 4 C.P.D. 148; Cf. Goodman v. Layborn (1881) C. A. Roscoe's Digest of Building Cases, 4 ed., app. 162].

It was held in Stevenson *v.* Watson that the functions of an architect in ascertaining the amount due to a contractor are not merely ministerial, but such as require the exercise of professional judgment, opinion, and skill. Lord Justice Coleridge in that case pointed out that the quality of the work, and the extent to which particular deductions or additions come within particular heads of quantities, are questions perfectly fit for the determination of an architect; and in many cases it will be necessary, and probably in all cases required, that there should be an exercise of considerable professional judgment and skill, and that before the arithmetical results of so many feet of work and so many pounds and shillings for the work can be arrived at, there must be knowledge of the work, familiarity with the bills of quantities, professional understanding to comprehend the technical terms and judgments to say under which head the deductions or additions ought to be placed. Although the result is one of figures, before it can be arrived at there must be an exercise of professional knowledge, skill, and judgment. An architect in this relation, said Lord Denman, is not to be dealt with as a mere caster-up of figures, but as one

*Substance of a paper read before the Institute of Builders, on November 11th, by Mr. A. M. Brice, of the Middle Temple, and Oxford Circuit, Barrister-at-Law; author of "The Legal Liability of the Architect."

having to do something requiring judgment, discretion, and skill.

III. The final certificate of the architect must be bona-fide [Stevenson v. Watson (1879), L.R., 4 C.P.D., 148]. For where the building owner and the architect act in collusion, and in such collusion the architect abstains fraudulently from doing his impartial duty to the builder, the builder can maintain an action either against the building owner [Batterbury v. Vyse, 2 H. and C. 42] or against the architect [Ludbrook v. Barrett, 36 L.T. (S.S.) 616]. The architect, said Lord Denman, in Stevenson v. Watson, "must exercise his functions fairly and honestly between them [*i.e.*, the parties trusting to him], and if he violates that duty he is liable to an action."

IV. The final certificate of the architect must comply with the terms of the contract.

Obviously, the certificate must follow the conditions imposed by the contract, or the architect would be exceeding his authority and the terms of his reference.

If, for example, the certificate had been given before certain preliminaries required by the contract had been performed, it would not bind either builder or building owner. In practically every contract, certain conditions are conditions precedent to the validity of what purports to be a final certificate.

V. The final certificate must be given when and while the power to give it exists.

Thus, as a rule, an architect has no power to give a final certificate until after actual completion of the work, and, if he has given orally or in writing what was or was not intended to be such a certificate, but which in fact amounts to such a certificate, then he cannot issue another certificate. For he has already discharged his duty, and, as in the case of an arbitrator who has made his award he is *functus officio*, and the existence of his power has come to an end. But, on the other hand, the terms of the contract may provide for the issue of supplementary certificates, and in such a case a power would survive to give such supplementary final certificates.

In the case of McGreevy *v.* Boomer [Sup. Ct. of Can. (1880), Cassell's Digest 73], the building owner exercised his power under the contract, and terminated the contract, and the engineer gave, in accordance with the contract, a certificate of all that was due up to the time of the termination of the contract. Subsequently, however, he delivered a further certificate, in which he amended the one given previously. It was held that the former certificate was not a progress but a final certificate, and consequently that it was binding.

VI. The final certificate must, if it incorporates a binding valuation, be given by a licensed valuer upon stamped paper.

This would indicate that if a final certificate is a binding valuation, that certificate could not be legally issued, nor will it be valid as between the parties unless the certificate be written upon stamped paper, and be issued by a person who is a licensed valuer. Such a view is not commonly held, and it will be useful to set out the reasons why it should be taken into account.

The architect who gives a certificate is not, be it remembered, an arbitrator. As Lord Justice James pointed out in that most important case, Sharpe *v.* San Paulo Railway [1873, L.R., 8 Ch. 597 at 609], the architect giving a certificate which determines the sums to be paid is not like an arbitrator dealing with evidence, or like a judge dealing with a law suit. The very object of leaving these matters to be settled by the architect is in order to obtain the application of his own practical knowledge. It is intended that he, as an architect or surveyor or engineer or valuer, may say what is the proper sum to be paid under all circumstances. There can be little doubt that in such a case he is acting as a valuer, and that his final certificate is intended to be a binding valuation.

Now the 4th section of the Act of 46 George III., c. 43, an Act for granting certain stamp duties on appraisements, enacts that "every person who shall value or appraise any estate or property, real or personal, or any interest in possession or reversion, remainder, or contingency in any estate or property, real or personal, or any goods, merchandise or effects of whatsoever kind or description the same may be, for or in expectation of any hire, gain, fee, or reward, or valuable consideration to be therefor paid him, shall be deemed and taken to be an appraiser within the provision of this Act to all intents and purposes."

Section 5 provides that such appraiser shall take out a licence annually, and section 6 that no person shall appraise or value any such property as described in section 4 "without being so licensed as aforesaid, on pain of forfeiting for every such offence the sum of fifty pounds."

Further, section 8 provides that such appraisers should within fourteen days of having made their appraisements write out the same on duly stamped paper, under a penalty of £50 for each offence, and section 9 enacts that every person who receives or pays for an appraisement not on stamped paper shall be liable to a penalty of £20 for each offence.

The question is again dealt with in the Stamp Act of 1891 [54 and 55 Vict., c. 39], and in schedule 1 to that Act the following is found under the head of "appraisement": "Appraisement or valuation of any property or of any interest therein or of any annual value thereof, or of any dilapidations, or of any repairs wanted, or of the materials and labour used or to be used in any building, or of any artificer's work whatsoever," and thereupon a revised scale of fees follows.

Now there are certain exemptions to this provision, and the first exemption runs thus: "(1) Appraisement or valuation made for, and for the information of, one party only, and not being in any manner obligatory as between parties either by agreement or operation of law." This exemption, which is clearly the converse of a final certificate, is founded on the judgment in Atkinson *v* Fell [5 M. and S. 240].

In that case Bayley, J., pointed out that "the words 'valuation or appraisement' do not extend to such as are made merely for the private information of parties, but to such only as are intended to be binding between them." And, following this, Holroyd J. held that the Act "does not extend to valuation made merely for the information of the individual, but such only from which a right of action or some certain benefit may accrue to the party were in the contemplation of the legislature."

From the foregoing considerations it seems obvious that the architect, in issuing a final conclusive certificate, is acting as an appraiser or valuer, and that his appraisement should be on paper duly stamped according to the provisions of 54 and 55 Vict., c. 39. The cost of the annual licence of a valuer or appraiser is fixed by 8 and 9 Vict., c. 76 S.I., at £2; and whenever taken out, it expires on July 6th in each year.

The Finality of the Final Certificate.

In addition to the foregoing requirements, there are certain other considerations involved in the conclusiveness of the final certificate.

In the first place, there is the fact that such a certificate may be purely oral and in no particular committed to writing. It has been repeatedly held that where the contract does not require a certificate in writing, an oral approval will suffice. In the case of Roberts *v.* Watkins [(1863), 14 C.B.N.S. 592; and of Coker *v.* Young (1860), 2 F. and F., at p. 101], where, under a builder's contract, certain instalments were to be paid as the work proceeded, and the balance within two calendar months after the completion of the contract "provided that the architect should have certified that the whole of the work had been completed to his satisfaction," it was held that it was not necessary that the architect should certify in writing.

"There is nothing" (in the contract), said Williams J., "to make it requisite that this should be done in writing, though it is usual to give the certificate in writing, and in most cases it is required to be in writing. But I know of no rule of law which prevents the architect's satisfaction being certified by word of mouth. To hold that a written certificate was necessary here would be importing into the contract a term which is not found here." Willes J. agreed, and Byles J., in also concurring, said "The natural and ordinary meaning of the verb 'to certify' is, to give information or assurance. If it necessarily imported that this should be done in writing, the words 'in writing' which are commonly found in these instruments, are otiose. There are many things which may be equally well done by word of mouth, in the absence of a stipulation that they shall be done in writing."

If, however, the contract states that the certificate must be given in writing, then in writing it must be given. There are numerous cases illustrating this, but reference may be made to Brunsdon *v.* Staines Local Board as a ruling case [1884, 1 Cab. and El. 272 and cf. Russell *v.* Sa da Bandeira, 1862, 13 C.B.S.S. 149]. Again, in this case of Russell *v.* Sa de Bandeira, where orders and extra work and alterations were expressed by the contract to be in writing, and such work was done on the faith of oral orders, Chief Justice Erle stated that the court could not yield to suggestions of hardship on the one side or the other. "I feel bound," he said, "to give effect to the terms of the contract, and to hold that the extras and additions supplied, not under written orders, during the performance of the contract, form part of the contract for the construction of the ship, and are not to be paid by the defendant."

(*To be concluded.*)

The fine old fifteenth-century tower of Fowey parish church is about to be restored. The tower, which is about 100ft. high to the tops of the crocketed pinnacles, is in four stages, each stage being marked by a band of Gothic tracery. The church itself was rebuilt in 1336.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

The Architect's Relation to Reinforced Concrete.

The title chosen for this article is, perhaps, rather wide, and some persons may object that we do not cover all aspects of the subject. We are aware of this ourselves, for limits of space prevent a very comprehensive treatment, while no two persons' views on the subject are exactly alike, and no doubt there are many other aspects from which our readers may regard the matter. We always welcome the expression of opinion in regard to such subjects.

First, we may remark upon the fact that reinforced concrete construction is still rather novel in principle, and though we have certainly made tremendous strides in the last few years, there are still many architects who have not yet had the opportunity of closely investigating the matter and obtaining personal practical experience in its use—we mean from their point of view, of course, and not experience of the same nature as the specialist. The theory of reinforced concrete is rather intricate, though it is not really difficult, but it no doubt deters certain practitioners from studying the subject. Probably to many, minute and intimate knowledge is unnecessary. The architect, as long as he grasps the main principles, is perhaps sufficiently equipped for all ordinary circumstances and for the more general practice of the profession. Modern building construction is becoming so intricate that it requires many specialists to deal with all its various aspects, and no man can claim to be expert in all branches. The architect is the supreme controller of many workers and of a multitude of hands, and he orders their efforts on some general plan and to some general scheme. It would be foolish to require him to design every part, for it is not only impossible but quite unnecessary; it would neither make for efficiency, beauty, nor economy. Buildings nowadays embrace the work of several main professions, which again of recent years have become split up into various branches, each of which is specialised, and it is seldom that a professional man can be expert in even two branches. For instance, we have ventilating and heating, lighting, steelwork, reinforced concrete, plumbing and sanitation, electric fittings, mechanical equipment, cold storage, furnishing, besides the main divisions of architecture and civil engineering. On a large building, the architect calls in the assistance not only of the specialists in all the above-mentioned branches, but he has the assistance of the civil engineer, to whom he delegates a considerable part of his controlling duties, while he also engages the services of a quantity surveyor, and often a mechanical and electrical engineer. The architect's province is to co-ordinate the work of all these individuals, and to act in a province which can be compared with that of the admiral who has the assistance of his vice-admirals and captains, and they in turn the assistance of various officers in charge of specialised departments. The architect has a great province, and his control must be absolute, but the same principle applies to his control as that in any other walk of life; those who are entrusted with important work must be given a certain amount of responsibility and their opinions listened to. It has been argued that reinforced concrete will eventually come into the hands of civil engineers for designing, but everything, in our opinion, points to the opposite conclusion; for, just as the architect has had to devote himself to the general control of specialists, and no longer is able to design every part of the work himself, so the civil engineer has to delegate his work to many others. For instance, at one time he dealt with mechanical, electrical, and chemical engineering. Even at one time military engineering was within his province, though as regards the last the term "civil" was, of course, to distinguish the profession from that of the military engineer, but previous to that time an engineer embraced all branches of engineering. We find to-day, too, in the civil engineering profession, that firms are undertaking the design as well as construction of works, for instance, bridges, roofs, etc., in steel; while in other branches of engineering we find machines of all kinds, electrical work (comprising whole installations), locomotives, ships, etc., designed and supplied by firms of contracting engineers. The more work becomes specialised, the closer does the specialist become associated with the carrying out of the work; for it is the practical acquaintance with work that is the basis for all the advance in design. The profession of the civil engineer, like the profession of the architect, is becoming one more of generalising the construction and the work of specialists, and a supervision on behalf of the client. We do not think that reinforced concrete, any more than steelwork, will in the general way be designed by the civil engineer. The work will be in the hands of specialist firms, and there are many advantages in that method of dealing with it. No doubt some of the disadvantages which are at present obvious to anyone, such as the inordinate duplication of designs, will be eliminated in the course of time. Standardisation will overcome this to a great extent, and no doubt the industry will become more settled, and certain firms will be recognised for certain kinds of work, and a better understanding exist between themselves, and with the architect and the consulting engineer.

Coming now to another aspect of the subject—namely, the artistic treatment—we have always looked upon the architect as the artist in building. It is not, perhaps, always clearly distinguished that the artist is made, not born—that is to say, he must have training. The special function of the architect, therefore, is his ability, obtained as a result of training and specialisation in the planning and artistic design of buildings, and no one without such a training can design work that shall be architectural. That the artistic treatment springs from the construction is admitted, but a wider knowledge is required than a knowledge of one special form of construction. We do not see that the specialist in the engineering design of reinforced concrete can ever hope to deal with the artistic treatment; that is the architect's province. The architect is a man of refinement as regards artistic sense, and we are not going to effect the solution of the difficult problem of obtaining an artistic rendering of the new methods of construction in reinforced concrete by asking the specialist engineering designer to undertake it; we must wait for the architect to obtain sufficient grasp of the main principles of the subject, and to experiment, until he is enabled to present the new material in an architectural form. It has been contended that the architect of the future, even as a few architects do in the present, will be able only to deal with the client, run his practice as a business, and co-ordinate the work of the specialist, and that he will delegate the artistic rendering to a specialist in the decoration of the structure, the two, perhaps, working as partners. In large practices in the United States, some few firms have offered, as a solution, a partnership of two or three men, one of the principals dealing with the professional practice from the commercial side, another from the artistic side, and a third dealing with the execution of the engineering and building work. The heads of the firm are, however, men of sufficient talent and general education to be able to appreciate in some part the work of each other, and they co-operate and consult so as to secure some uniformity in the scheme of operations. Architects engage many assistants nowadays, and often in the practice of our most eminent architects a great deal has to be left to their assistant or junior partners. Still more so does the same principle, which is in question now, refer to reinforced concrete work. The engineering aspect of the subject is important, and it naturally must affect, in some degree, the architectural treatment, but it must conform with the plan. At the same time the plan may receive modification on the score of economy, or for other reasons of efficiency, in regard to the reinforced concrete work. This relation will be obtained by consultation; by some general grasp of the fundamental principles of the subject; by standardisation and by the expressions of the various points of view of the architect and the specialist. No doubt, before long, we shall be able to deal with reinforced concrete satisfactorily from the architectural point of view. As regards the treatment of the facade and the interior decoration of buildings, the architectural profession in this country and the United States has been struggling for some years to find an architectural treatment of the steel-frame building, and has achieved some measure of success. We now have the problem of treating the reinforced concrete frame building itself very much the same as the problem of the steel frame, but there are also other perhaps superior advantages in connection with reinforced concrete as regards fire resistance and freedom from corrosion, and the facilities it offers for securing a permanent form of decoration, that may lead to a very different method of handling. That, however, is the architect's province, and specialist firms cannot hope to deal with it; but, on the other hand, the architect cannot hope to deal satisfactorily with the engineering side of the question, any more than can the civil engineer—consequently, the place of the specialist in reinforced concrete, and the position of the architect, and of the civil engineer, are thereby respectively defined.

FORMS FOR REINFORCED CONCRETE.—V.

(Concluded from p. 357, No. 717.)

In concluding our notes upon centering or forms for reinforced concrete, we have to deal more particularly with curved forms.

Chimney work we need not here deal with, for such work is in the hands of a few specialists, and the work is generally done with the aid of specially patented moulds or forms, each being designed to facilitate their gradual rising as the structure is erected. Of course, at a great height, simplicity and ease of erection is very desirable. The moulds are carefully made and clamped in special ways, so that they can be easily undone, shifted up a few feet, and readjusted. The moulding, therefore, of annular pieces in a vertical position we need not further consider.

For the construction of piles and other circular and square pieces cast horizontally, moulds are employed, and these were dealt with by Mr. Vere Sussex Hyde in our issue for November 4th; they hardly belong to what may be classed as forms, with which it is the purpose of this article to deal. Mould construction for artificial stone is out of our present province, and where the materials are used over and over again for casting reinforced concrete pieces they belong to that category.

We now have to consider large sewers, tunnels, and culverts, which are now largely constructed in reinforced concrete.

Fig. 1 shows an arched culvert. The manner in which this was constructed was to excavate the ground closely to the curve required, deposit the concrete on the soil, and work to the exact form of the bottom by means of the invert template shown in Fig. 2. The surface was smoothed with a batten working on this template. The concrete at the bottom was left with a slightly inclined surface, probably so as to receive the thrust of the arched side and roof, and was roughened to afford a good bond thereto. In this invert were placed two curved side-pieces, the construction of which is shown in Fig. 3. These were fixed apart by means of a hinged cross brace (Fig. 4) sprung into position and bolted. The centering for the arch (Fig. 5) was then placed upon these side-pieces and propped at the centre by a vertical post. The concrete that was deposited upon this centering was again worked exactly to the required curve by means of another template, shown in Fig. 6; to retain the concrete in the haunches it was necessary to place planks against the template, but for the upper portion of the arch, where the concrete was able to stand alone, these planks were omitted. The centres and the forms were all built in sections 12ft. 6in. long, as the dimension on the drawing shows, and a sufficient number were provided on the job where this centering was used, to lay twelve sections of invert and six sections of arch. The removal of the centering was easy; all that was necessary was to remove a bolt in the cross brace, open on its hinges, pull away together with the side-pieces, and the arch then dropped. It was found that the centering could be removed in about three or four days after the concrete was put into position.

In designing centering for conduits it should be recollected that as few places as possible should be left where the old is joined to the new concrete. It is, therefore, desirable in each day's work to continue the concreting so that no portion has time to set before the adjoining portion is concreted; therefore, there should be sufficient centres to have several lengths ready so that the men can be working regularly forward. Where the concrete has to be stopped at each day, the surface should be left rough, so as to give a good bond to the next length.

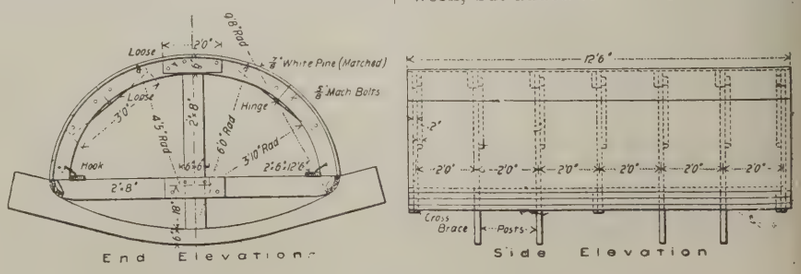

FIG. 5. ARCH CENTER AND GENERAL CONSTRUCTION OF CULVERT.

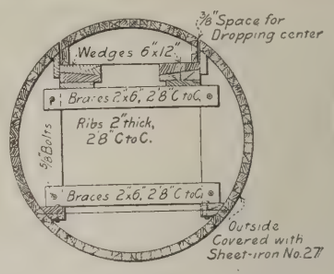

FIG. 7. FORM FOR 6-FT. SEWER.

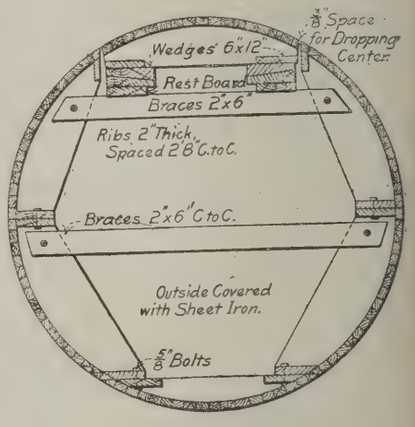

FIG. 8. FORM FOR 8-FT. 6-IN. SEWER.

Fig. 7 shows a form for a 6ft. circular sewer, and Fig. 8 shows one for an 8ft. 6in. sewer section. The lengths of the former are 8ft. It may be noted that two sections, or 16 lineal feet, were built in eight to nine hours, including the setting of forms, by one foreman, one carpenter, and 15 labourers. The section contained 13 cubic yards of concrete. The same gang built 14 lineal 8ft. 6in. sewers in ten hours with the other form. Fig. 9 gives a section of the larger sewer, in which it will be seen that the reinforcement consists of expanded metal. It was as the result of experience in the particular job where this centering was used that the form of conduit shown in Figs. 10 and 11 were substituted, which overcame the difficulty there was in ramming the concrete in the bottom and lower corners of the circular section. It was also found that the expanded metal could be handled easier with this shape, and we may note that the reinforcement were very heavy, two layers being found to be necessary in many cases. It was found with a small mesh that there was a tendency to screen the larger stones from the concrete, and therefore the 6in. mesh was employed and found to work well. The centres were covered with galvanised sheet iron, which not only gave a smooth surface to the concrete work, but added to the life of the centres.

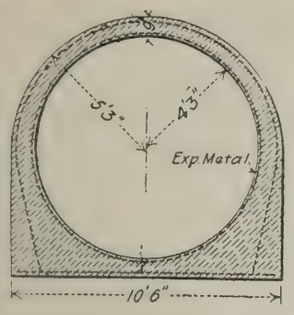

FIG 9.
SECTION OF 8FT. 6IN. SEWER.

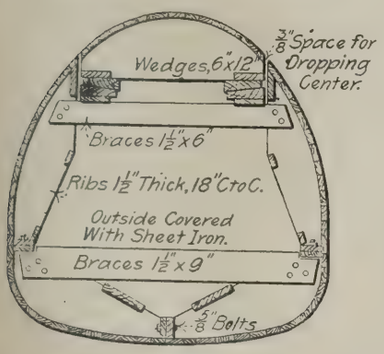

FIG. 10.
FROM FOR 7-FT. 6-IN. CONDUIT.

The bracing was arranged so as to allow the centering to be taken apart after the concrete had been in place for at least sixty hours, and to be brought forward through a form already in place for further use.

There are several special patented forms of steel sheet centering on the market. The centering is made in two halves, kept in place by rods having turn-buckles, which not only stiffen the form, but enable the ends to be drawn inwards, so as to pull the form away. The top half rests upon the bottom, and when reduced in this way can be dropped down

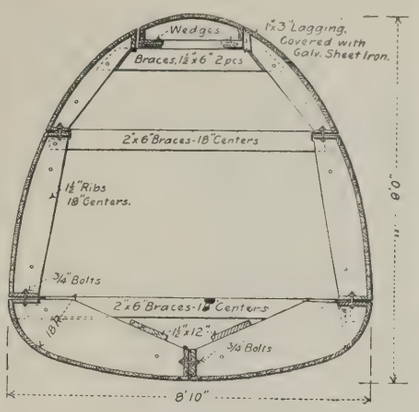

FIG. 11.
FORM FOR 9 FT. CONDUIT.

for removal, and the bottom can likewise, when reduced, be lifted up and removed in a similar way.

Fig. 12 shows the form of centering adopted for constructing the East Boston Tunnel, which was built in concrete by the aid of compressed air. The side drives, slightly chamfered, were pushed forward from 60 to 100ft. in advance of the shield, so that the concrete side walls, which were built in these drives to a height of about 16in. below the line of the arch, could set for about ten days before the shield reached them. The shield, resting on rollers, moved along on the inside of the walls, and the main excavation was made through it. The concrete arch was built as soon as the earth was removed. The supports for the centering consist of steel rods, shown in the diagram placed 2½ft. apart and supporting 4in. lagging. Portland cement grout composed of 1 part cement to 2 parts fine sand was forced in on top of the arch so as to form a film of about 1¼in. The invert was laid as the shield progressed. The progress of excavating was about 6ft. in 24 hours, about fifty men being employed on each of the two shifts.

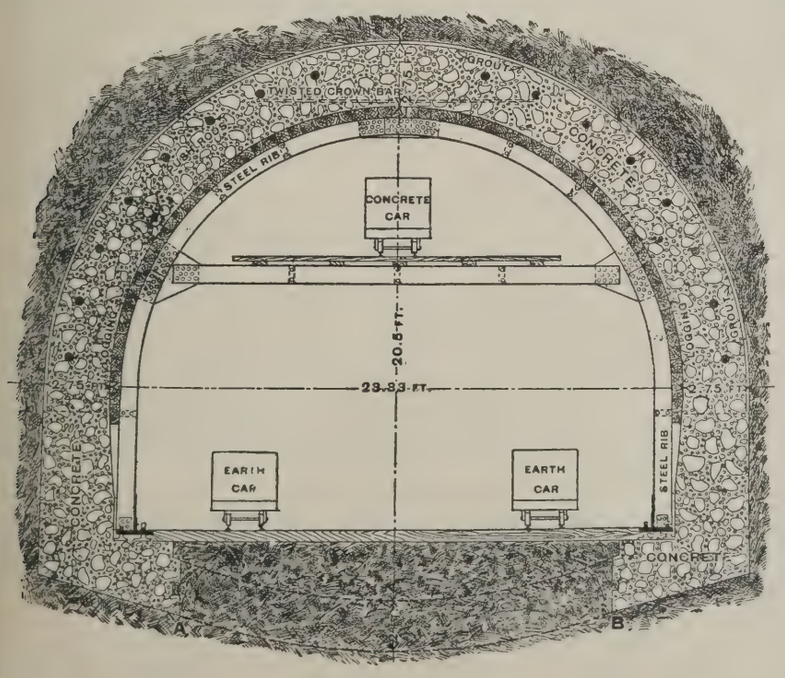

FIG. 12. CENTERING FOR TUNNEL.

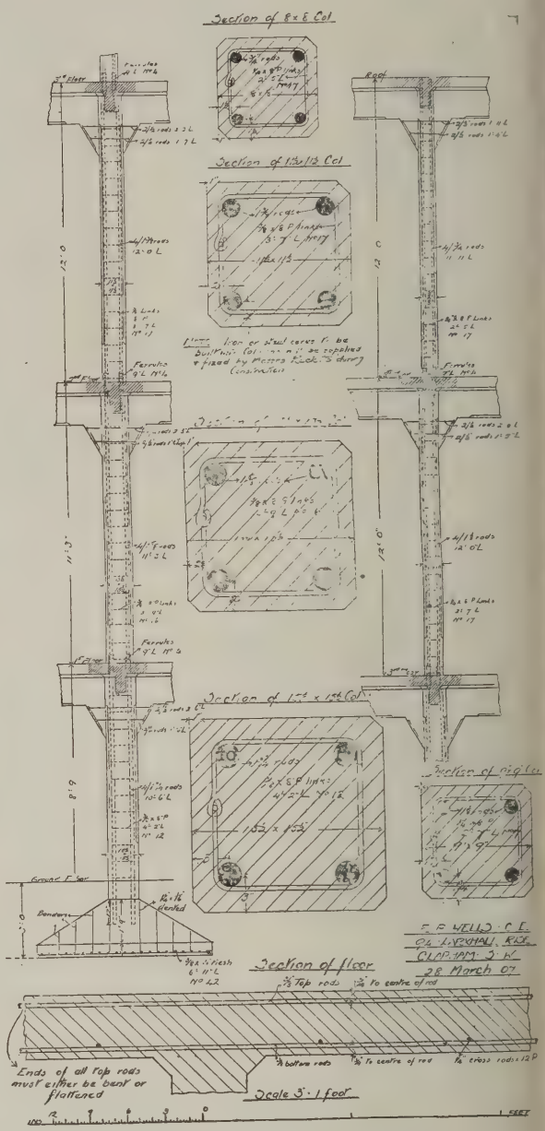
CAST-IRON PIPES.

The Engineering Standards Committee has recently issued two reports on cast-iron spigot and socket pipes, one relating to low-pressure heating pipes, and the other to flue or smoke pipes. It is noticeable in the case of both specifications that it is stipulated that no pipe shall have an internal diameter or bore of less than the nominal dimension; that is to say, that the purchaser of a 6in. pipe shall obtain a pipe 6in. in internal diameter instead of one of $5\frac{7}{8}$in., or even less, as is at present often the case. The specification also required the pipes to be marked with distinctive class letters, to show the purposes for which they were made, and also with the manufacturers' trade mark or initials for the purpose of identification. Standard dimensions and designs for the soot doors of the various sizes of pipes are given in the specification for flue or smoke pipes, and both specifications are complete with tables of dimensions of the standard pipes and fittings.

With regard to heating pipes, the sub-committee draw attention to the fact that some public bodies require heavy pipes and deep sockets, whereas in many districts light pipes and short sockets are in use. They seem to have taken the mean, and they express the opinion that the depth of sockets and weights recommended in the standard pipes will render them not too heavy to be used for ordinary construction, and, at the same time, will be thoroughly sound and reliable.

Reinforced Concrete in Manchester.—The Parliamentary powers that are now being sought by Manchester include the following clause relating to reinforced concrete construction:—"To make further provision for controlling and regulating the erection of buildings or structures in reinforced concrete or of iron or steel construction, or in which iron or steel are largely used, and to authorise the erection or construction of such buildings, subject to the deposit of such plans and to such restrictions and conditions (if any) as may be prescribed or authorised by the intended Act, or may be imposed by the Corporation; and, so far as may be necessary, to alter, amend, and extend the provisions of and the powers conferred by any of the Acts or by-laws of the Corporation relating to buildings." If the Bill passes, the architects of the proposed new building for the Young Men's Christian Association will avail themselves of the facilities afforded by this clause: the use of reinforced concrete in Manchester being at present forbidden by the by-laws.

* * *



The development of bridges was the subject of a paper read at a meeting of the members of the Sheffield University Engineering and Metallurgical Society by Mr. G. F. Dale, who traced the gradual growth of engineering design and enterprise from the arch as seen in nature, the crude and primitive bridges of the East, some of the famous Roman examples as the Segovia viaduct in Spain; and so through the centuries down to modern times, where the trestle and boat bridges were taken as the intermediaries between ancient and modern structures. Various designs and types of suspension, cantilever, and large span arch bridges were commented on, special attention being given to the Forth Bridge, among others.

NEW MILL FOR RECKITT & SONS, LTD., HULL. GENERAL VIEW.

NEW MILL FOR RECKITT & SONS, LTD., HULL. DETAILS OF COLUMNS.

A HULL MILL.

We give an external and an internal view of Reckitts' Mill at Hull, which manufacture a metal polish called "Brasso." The building is carried out in reinforced concrete, and has been constructed by Messrs. Stuart's Granolithic Company, of 4, Fenchurch Street, London, E.C., upon the "Wells" system, the work having been designed for Messrs. Stuarts by Mr. E. P. Wells.

We also reproduce several of the working drawings, showing parts of the construction in detail. The "Wells" system was dealt with at length in our issue for July 19th, 1907. We may here briefly note that its chief distinctive feature is the use of the patent twin bar, which secures a rigid attachment of the shear members. The shear or diagonal reinforcements are passed through holes punched in the diaphragm between the bulbs of the bar, and are bent round. Not only is the system more theoretically perfect by such means, but the practical work of construction is greatly advantaged. We draw special attention to the following features of the construction:—

Floors designed for 2cwt. per ft. super inclusive, except for one portion, which had to sustain a live load of 2cwt. per ft. super, and entailed the use of the heavy stanchions shown in the illustrations.

Roof was designed for 1½cwt. inclusive, and the larger post had to act as a tank for water, and the remainder as a playground for girls.

When completed, a portion of one floor was tested to 50 per cent. excess load without showing any appreciable deflection.

The first sod of a new railway between Lampeter and Aberayron, with a probable extension to Newquay, further south, has been cut by Miss Molly Harford, daughter of Mr. Harford, chairman of the board of directors. The line will cost £80,000, and will be thirteen miles long. Half of the money has been found by the Treasury and local bodies, and the rest by landowners and directors.

Views and Reviews.

Diagrams for Designing Reinforced Concrete.*

Books of diagrams and tables intended for the design of reinforced concrete can hardly be expected to be elastic enough to meet all conditions of practice, but they serve a useful purpose in saving a certain amount of laborious calculation, and in serving as a rough and ready means of approximating to a correct result, as also a means of roughly checking designs. This work is only a small one, but it is printed in large portfolio size, which certainly renders the diagrams clear. It is based on the R.I.B.A. report on reinforced concrete. It is a useful book, but we regret that it were not much better done.

* "Reinforced Concrete Diagrams, for the Calculation of Beams, Slabs, Columns in Reinforced Concrete." By G. S. Coleman, Assoc.M.Inst.C.E. London: Crosby Lockwood and Son, 7, Stationers' Hall Court, E.C. Price 3s. 6d. net.

Correspondence.

To the Editor of THE BUILDERS' JOURNAL.

Architect as Clerk of Works.

SIR,—May I, a clerk of works of many years' experience, express my views of the remarks in No. 719?

The office of clerk of works was in olden times quite different from what it is now. Education was formerly so rare that the term "clerk" meant learned, and was applied to scholars of different kinds. A clerk of works was then a scholar in building, and was really the architect and supervisor of the workmen, but times have altered, and a clerk is now usually a penman.

The modern clerk of works is an inspector of work begun and done to an architect's written order. The estate clerk of works is really a building foreman, and has different duties from those of the architect's clerk of works, and would be more aptly described as an estate building foreman.

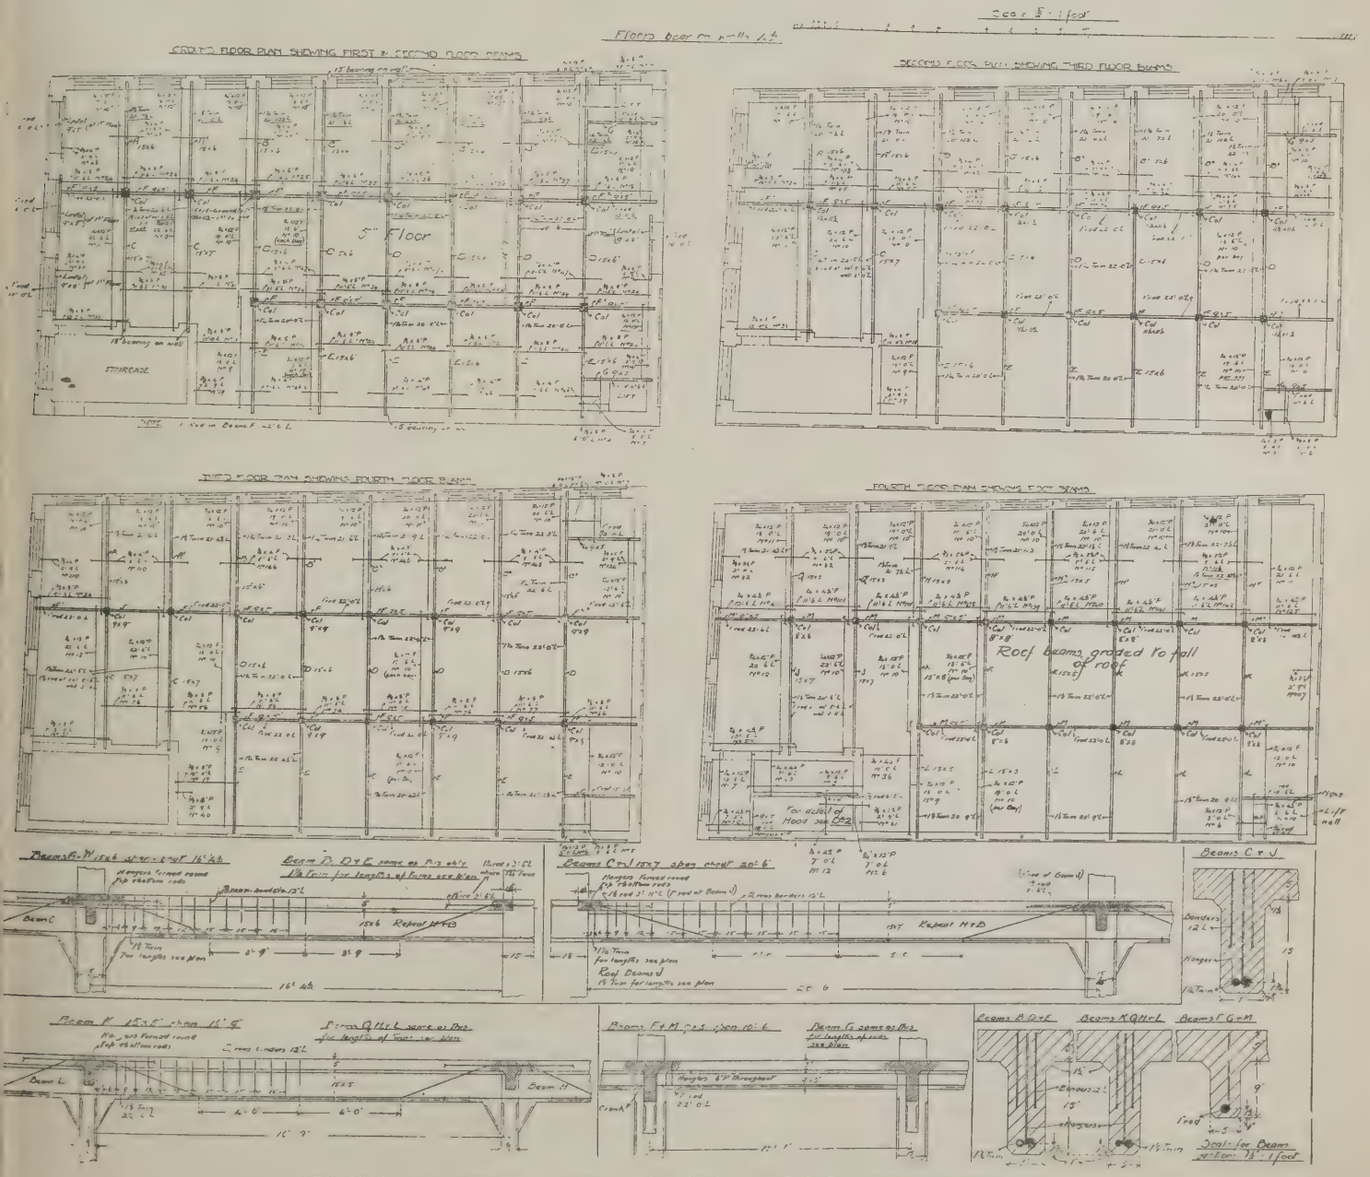
A man may be a very able architect and draughtsman, and yet be quite out of place on a building job in progress, and, as you have suggested, it was wiser under the circumstances to withdraw his application.

I do not agree that the question of status has much to do with the matter, as human nature will always assert itself in favour of the larger salary of three-pounds-ten against thirty shillings, and there is as much dignity in one office as in the other.

The chief requirements of a clerk of works is high character for integrity and sobriety, and a good practical knowledge of building operations gained by experience on buildings, and that is one of the chief reasons for a carpenter rising to the position. A carpenter has usually better chances of gaining an all-round knowledge than other working men, but not invariably so, and the most successful men in the calling have followed other branches of the building trade before becoming clerks of works.

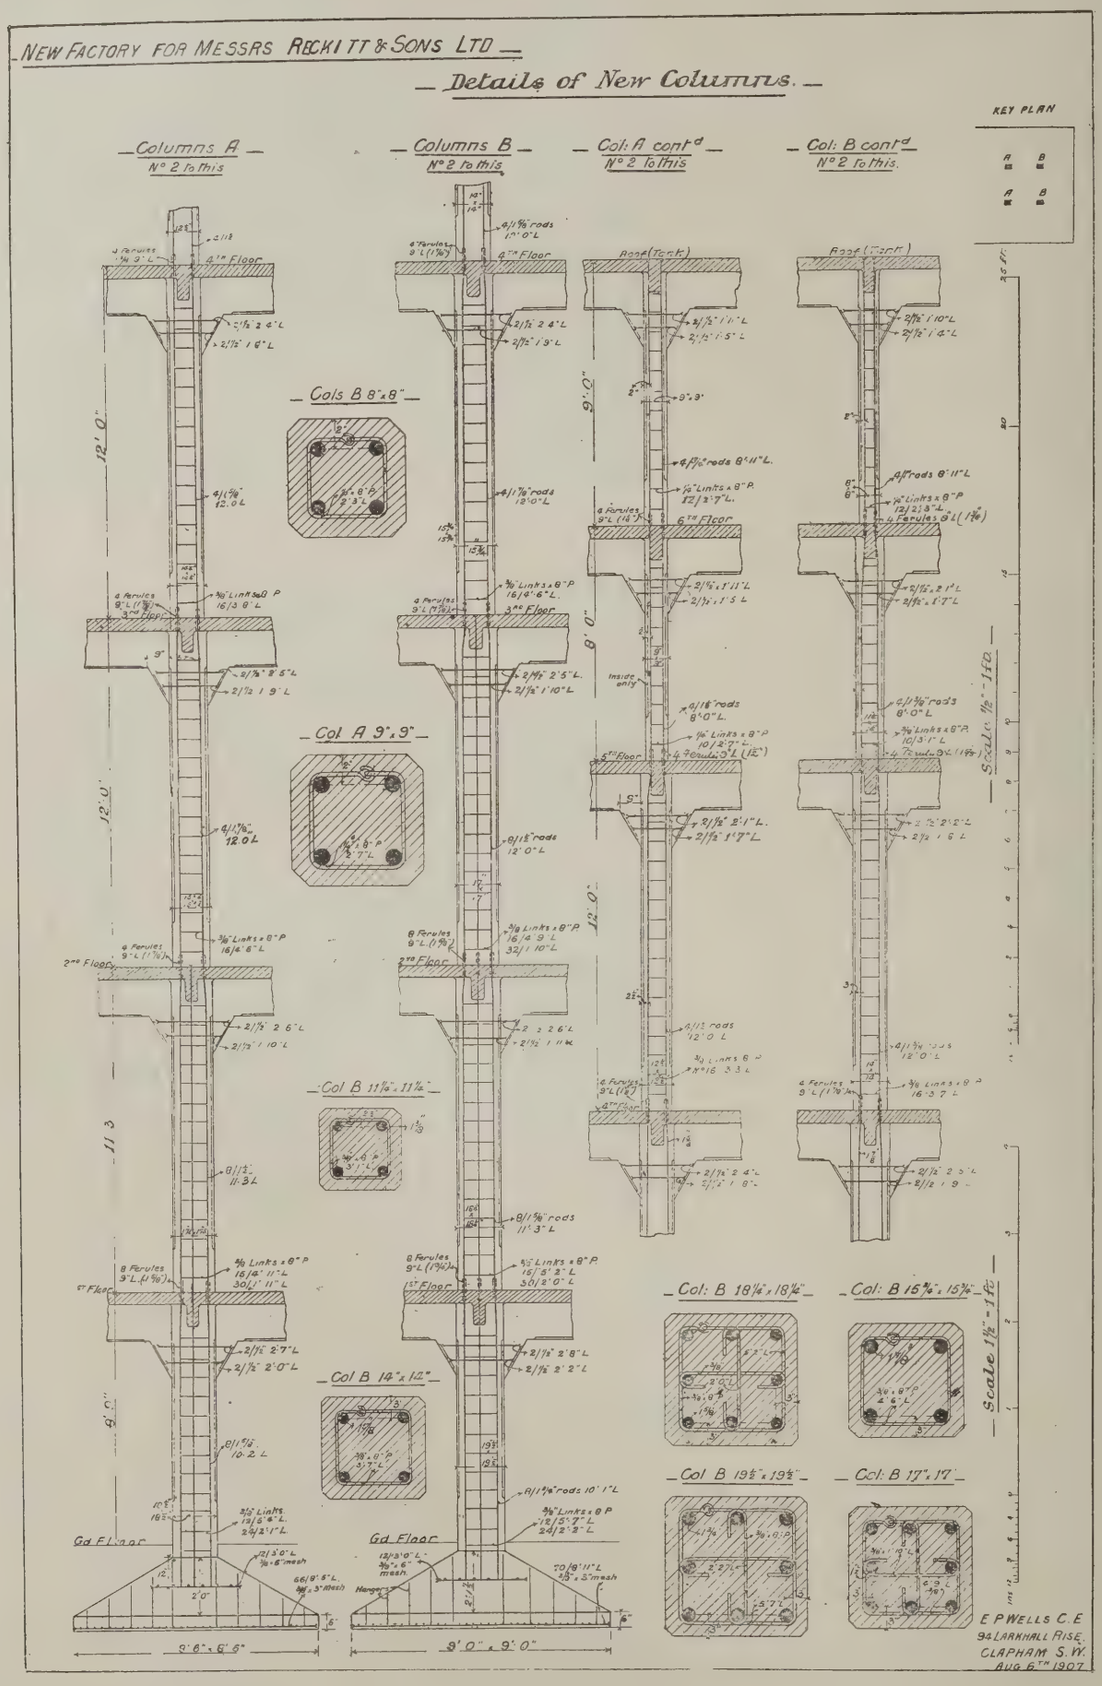
A "gentleman ranker" requires but a thorough knowledge of the building trade to become qualified, and if he devotes his early years to acquiring it he becomes a good clerk of works as a rule.

A knowledge or acquaintance with "the little tricks that have to be circumvented" applies to all enterprises, and is not peculiar to the building trade, but a man with good practical knowledge cannot be cheated if he is of upright charater, and want of that knowledge would lead to confusion and bother all round; so under all the circumstances I agree with your leader-writer that the objector referred to was justified, and that the candidate from the surveyor's office acted wisely in retiring.



W.

To the Editor of THE BUILDERS' JOURNAL.



SIR,—It was with great pleasure that I read your remarks under the above heading in the current issue of the journal. I agree that a thoroughly practical "gentleman ranker" should make a far better clerk of works than one selected from a surveyor's office. Observation convinces me that a gentleman from the office is not happy among practical tradesmen.

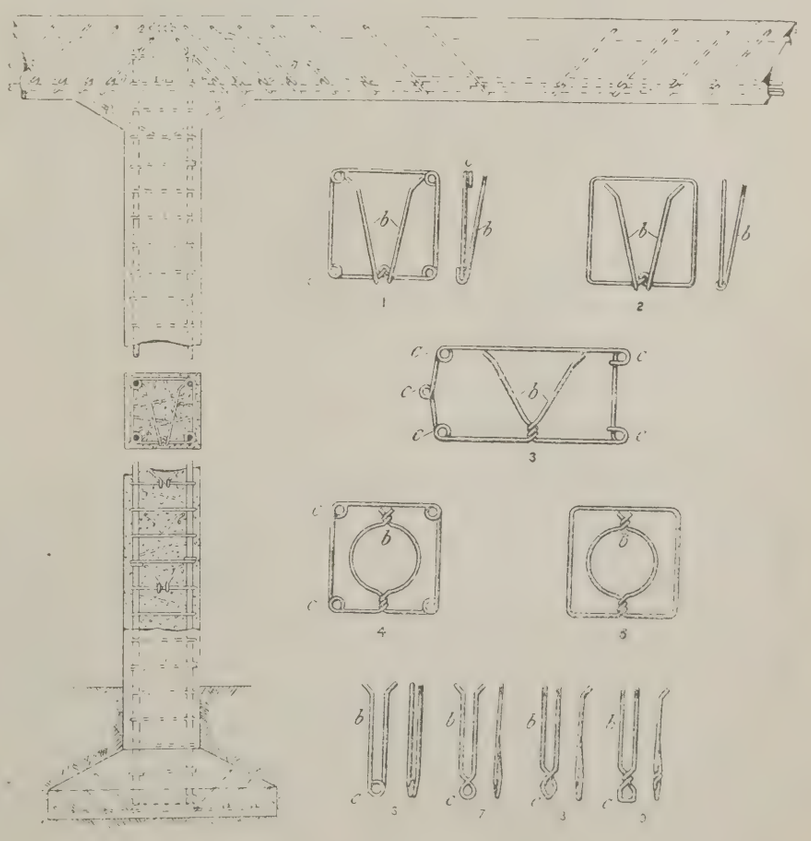
REINFORCED CONCRETE SYSTEMS: "THE PARAGON."

The system of reinforced concrete construction with which we have to deal in this article has not been long established, but it has ben worked out with considerable care. It is the result of a good deal of experience, and it is meeting with considerable favour, so that it is not by any means to be considered of mushroom growth, and it deserves careful attention by those interested in the subject generally. The "Paragon" system is worked by the British Reinforced Concrete Engineering Company, Ltd., of Royal London Buildings, 196, Deansgate, Manchester.

The main patents worked by the firm are the invention of a municipal engineer, who has been keenly interested in reinforced concrete since 1895, carrying out several works with it. We are informed that his experiments showed the importance of securely fixing the steel in such parts of construction as columns, so that it could not be disturbed in placing the concrete; while, in addition to this, the design of the hooping was carefully tested in order to ascertain the form that gave the best results, and also in this connection the value of adequately bonding the core. Numerous tests upon beams were conducted, and it was found from them that stirrups secured to the main tension bars and rods at an angle of 45 degrees gave considerably superior results to those with loose shear members, and were found to be easier to put in place.



In dealing with the system in detail, and endeavouring to explain the various principles and ideas upon which the company work, we may refer, in the first place, to the question of adhesion or bond. Our readers, of course, are familiar with the controversy between the advocates of ordinary plain bars and those who, on the other hand, favour deformed bars, the latter costing somewhat more than the former. This firm, however, if we may say so, adopt a middle course, because they claim that their method of attaching stirrups to the main tension rods secures a rigid attachment, so that plain bars, which have the merit of cheapness, can be used; and mechanical bond is easily obtained because the stirrups tighten on the bar when stressed, and refuse to slide, so distributing the stresses into the compressional area of the structure and developing its full strength. Experiments have shown, the company state, that when a bar does slip, it is not the bond that eventually yields, but the concrete shears, a coating of the latter being found adhering to the steel. The bond stress is claimed to be about twice as great as the shear strength of concrete; and it may here be mentioned that the Committee on Reinforced Concrete, appointed by the Royal Institute of British Architects, take somewhat this point of view, because they recommend that the following working stresses should be allowed:—Concrete in shearing in beams, 60lbs. per sq. in. Adhesion of concrete to metal, 100lbs. per sq. in. In their view, therefore, a concrete will shear before the adhesion is destroyed.

Stirrups are applied in beam construction for resisting diagonal tension stresses, often but erroneously called shear stresses. The load upon a beam acting downwards tends to cause the beam to slide down between the supports, or to shear on a vertical plane. This vertical shear occurs throughout the beam, but is greatest at the supports, and remains practically constant throughout the depth of the beam. Now, the imposition of the load tends also to bend the beam between the supports, and this tendency is resisted by the couple of stresses, compression above the neutral surface, and tension below. The compression and tension increase materially in amount from the neutral surface outwards to the top and bottom surfaces of the beam. Though the vertical shear is constant, the tension or compression is varying considerably in amount through the depth of the beam. The combination of the vertical shear and the horizontal tension or compression is such as to produce curves of principal stress through the beam, these curves crossing each other at right angles. The principle is that known as "Rankine's ellipse of stress." Concrete has much greater strength in compression than it has in tension, and is quite able to resist the compressive stresses, but along the lines of tensile stress is inclined to open; and in tests on reinforced beams, when taken to destruction, these cracks are noted extending in a direction inclined from the supports towards the centre of the beam. It is to prevent the concrete opening in this way that stirrups or diagonal members are placed inclining in the opposite direction, *i.e.*, to cross these lines of diagonal tension, and to hold the concrete together so as to prevent its opening on these lines. A vertical stirrup is not so efficient in its action as one inclined at about 45 degrees, and the result of numerous tests conducted by the British Reinforced Concrete Engineering Company has been to show clearly the greater efficiency of these inclined members compared with the vertical stirrup.

Figs. 6, 7, 8, and 9, show the types of stirrup adopted by this company, and it will be obvious that not only does the tamping of the concrete tighten such a stirrup upon the bar, but that, when it undergoes a pull, it tightens still more, and so resists sliding. This form of stirrup has the great merit of not becoming displaced by the action of tamping the concrete, and facilitates the work of construction, as well as securing superior workmanship. The stirrups, of course, being separate members, can be arranged to give any desired spacing along the bar, and they can be carried up to any height in the beam, so as to reach well beyond the neutral axis.

Perhaps the most striking feature of the system is in relation to the reinforcement of pieces subjected to compressive stresses—namely, columns, posts, or pillars. The distinctive point to be noticed in this system is the reinforcement of the core. When a reinforced concrete column is subjected to heavy loading, it begins to shorten, and the concrete tends to bulge out from the centre, ultimately splitting in a vertical direction when loaded to destruction. To prevent this tendency hoops or bindings are placed at proper distances apart, or wires are wrapped spirally round the main vertical rods, so as to form a hooping.

Experiments were conducted which showed various features of weakness in

FIGS. 1 TO 10.

"THE PARAGON" REINFORCED CONCRETE SYSTEM.

other methods of constructing such columns, but the particularly remarkable feature brought out by them was that if steel was distributed through the thickness of the concrete core, it greatly increased the strength of the column. For this reason the company use a form of hoop-brace, which has inturned arms, or the arms may be twisted together to form spiral bonds, which lie through the centre or core; and as each alternate pair of arms or bonds are placed so as to lock in a different direction from that of the preceding ones, the whole structure is not only hooped, but the spaces between the hoops are protected in every way against bulging.

We have heard a great deal about experiments conducted on columns reinforced with spiral binding, and the great increase of strength they showed over columns reinforced with heavy longitudinals and links, but the results of these experiments brought out the remarkable result that the strength of a column reinforced with the company's patent hoop braces extending through the core give on the *average* 60 per cent. greater strength than the spirally reinforced column gives as a *maximum*.

The results of these tests provide some further information of great value in regard to the spiral reinforcing of concrete. In the testing machine used, the base-plate was capable of rotation, but was, as a rule, securely fixed by a pin. By accident, however, the pin was left out, the result being that, when tested, it was found that the spiral reinforcement under load acted as a spring might, and induced a twisting action; so it proved that, in a spirally reinforced column, especially a long one, torsion is developed, and this no doubt materially reduces the strength of the column. Many of the tests that have been conducted on reinforced concrete have been on short posts, and when these had fixed ends in the ordinary fashion they showed a much higher resistance than it would be safe to reckon upon in practice where the length of the column is much greater. It was supposed theoretically that the hooping of the concrete resisted the concrete bulging or bursting outwards, and that it practically enclosed the concrete within a cylinder, so that the concrete was thereby enabled, to some extent, to flow under pressure. The results of experiments conducted by this firm, however, seem to show that if the interior core of a hooped column is of some size, such as we get in practice, then this core does not act so homogeneously, nor flow so evenly as we desire; but by the placing of cross-braces or reinforcements extending through the core in various directions, the deficiency in this respect is overcome, and the strength of the column greatly increased. Some columns measuring 8in. by 8in. by 2ft. 6in. long, made on the "Paragon" system of 1 : 2 : 4 concrete, with four $\frac{3}{4}$-in. longitudinal bars wrapped round with the firm's patent hoop-braces, required for their destruction a total load of 5,724lb. per sq. in. of the core.

Figs. 1 to 10 illustrate the general details of the "Paragon" system of reinforcement. Fig. 1 is a plan and side view of the hoop braces as adapted for use in solid square columns, pillars, piles, and such-like structures, and this form may also be used for a rectangular beam. It will be seen that the loops are provided to engage with four bars, these loops being made by coiling the round rods to encircle the bars and hold them in a proper position, ensuring that the core shall be of proper shape and size, while arms (b) extend across the area enclosed with a loop diverging outwards and their ends also bent and turned away from each other so as to bond the core. Fig. 10 shows these braces in elevation, as well as in plan, in a column, and it will be obvious therefrom how the arms in each hoop brace are turned each in a different direction from its neighbour, so as to cross the core from all directions.

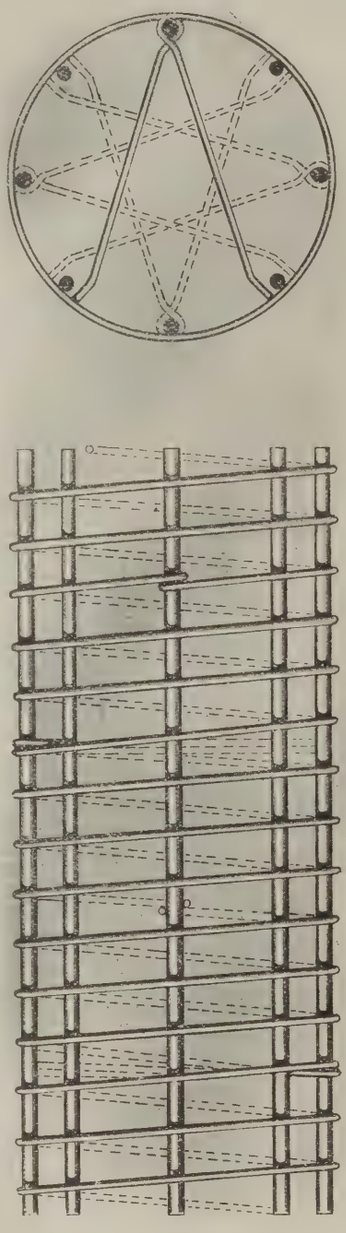


FIG. 11.

In Fig. 2 the coilings are omitted, this simply being a variation of the form shown in Fig. 1. The type shown in Fig. 2 is generally used in combination with that shown in Fig. 1, only every fourth one being as Fig. 1.

In Fig. 3 the hoop is formed to lie around and embrace five rods, and modifications of detail are shown to allow of the embracing of rods in parts of construction requiring to have a projection or tongue on one side, and a curve on the other, as illustrated in the middle reinforced concrete pile shown in Fig 14. It is obvious that such a form can be modified by the omission of the loops as in Fig. 2.

In Figs. 4 and 5, the difference is in the arms, which, instead of being straight, are curved, the ends being twisted to form a centre ring or annulus, by which the hoops may be used when builders or constructors have to deal with a centre column or pipe. Where it is impossible to make the arms straight, so as to ensure their forming a proper bond, it is found best to let them encircle the column or pipe and connect their ends.

Fig. 11 shows another type of hoop brace, which is a sort of sectional spiral binding, and in explanation thereof we quote the firm's arguments:—

"Much better results have hitherto been obtained, in laboratory tests, than in actual practice, with helically-wound hooping. In the former, the prisms or test pieces are small and quite easy to make, but in application to larger structures, it is attended with great difficulty to get uniformity and strength throughout. The usual way in constructing, say, a twelve-foot column, is to helically wind the longitudinal bars at a desired pitch, right from top to bottom, with wire, forming a skeleton or cage, and to build the timber forms around it to receive the concrete. Should the spiral wrapping re-

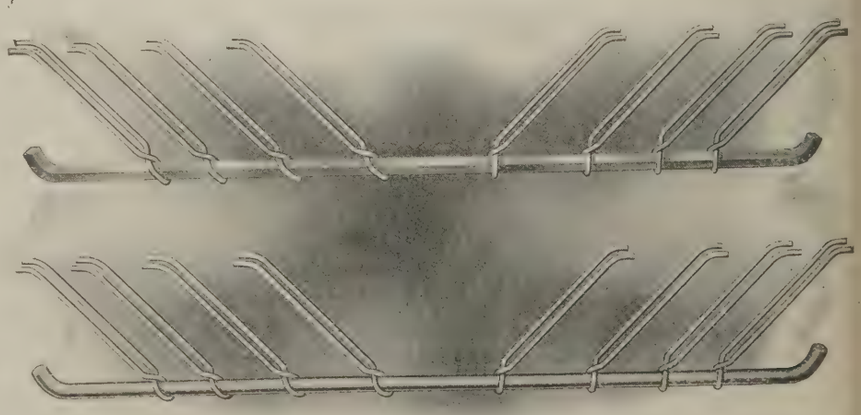

FIG. 12.

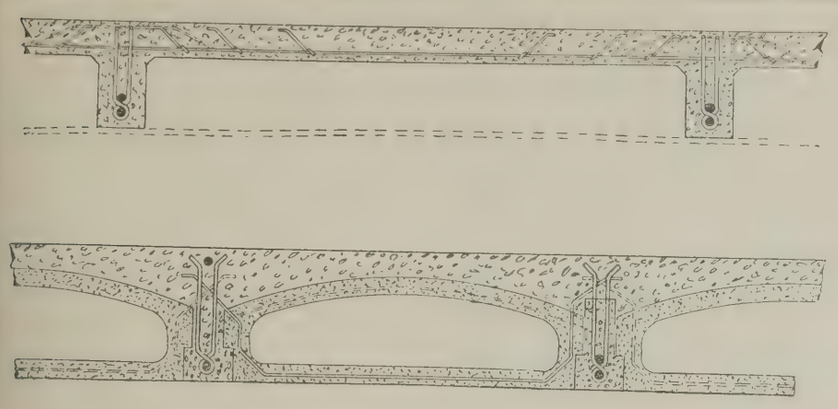

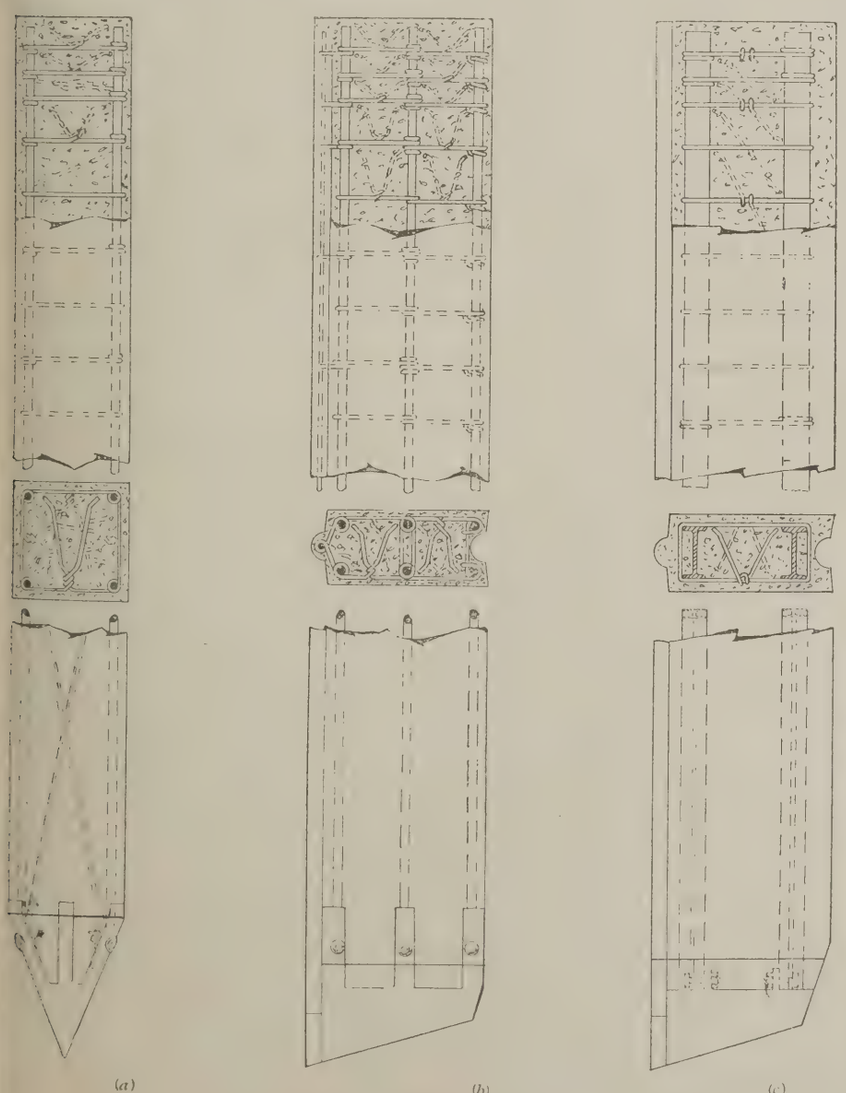

FIG. 12.

ceive a dent from a rammer or be otherwise injured—which, under the conditions, it is almost impossible to avoid—the whole length of winding is materially weakened, and has to be dropped in from the top, with the result that the larger particles leave the finer before reaching the bottom, making a porous base. There is also no means of seeing the concrete during the process of consolidating, except near the top, and the forms being full of steel rods they are not accessible for the tools; consequently, the work is troublesome and requires very great care, whilst rammers to reach so far are out of the question. The result is obvious, and to avoid these dangers our investigations led us to sectionise this winding wire, arranging the ends of the sections to reinforce the core in the form of bonds similar to our hoop braces. The sections are cheaply made by machinery, and when required one is threaded over the end of the bars, fixed in position, and the concrete filled around it, the placing and consolidating being carried out from the open side of the timber forms, there being ample room to avoid obstruction to the ramming, which is all done in full view. When another section is required, the operation is repeated, and the whole structure is gradually built up from the bottom, in the same manner as is done with hoops, without it damaging the reinforcing, and allowing the whole length to be accurately steeled and the concrete made of uniform strength throughout. This sectionising can be carried out to any desired extent, and in some pillars of rather large diameter, 35ft. in length, for a load of 300 tons, recently completed by Messrs. Lever Bros., Ltd., of Port Sunlight, under our patents, it was found convenient to divide this circumferential winding into a little over two parts in each complete circuit."

(a) (b) (c)

FIG. 14.

It is stated that tests have shown that there is practically no difference in the strength of columns reinforced with the ordinary hoop braces and with the sectionised spiral wrapping if both are made of the same pitch and of the same quality steel.

Figs. 6, 7, 8, and 9 show various forms of the Paragon single braces or stirrups adapted for use in floor beams, walls, etc. In Fig. 6 the metal is coiled centrally to form a loop (c), and its arms (b) are straight, except at the ends, where they are twisted to secure a mechanical bond. In Fig. 7 the metal is not coiled, the arms merely crossing each other, afterwards being either bent at an angle or curved. In Fig. 8 the same formation is adapted to a diamond-shape bar on edge, while Fig. 9 shows the adaptation of a square bar on the flat. The two latter forms fix the stirrup from working round or falling on to one side of the bar, which is an obvious convenience in the practical work of construction. Though shown made of a round steel rod, the stirrups, when designed, can be made from flats, and they have been supplied made of $\frac{5}{8}$in. by 3-16in., but the round rods are considered to give a better distribution, and to make a stronger job.

Fig. 10 is a diagram showing the general manner in which these hoop braces and stirrups are employed in the reinforcement of a column and beams and foundations.

As regards general arguments in favour of the system, it may be said that the reinforcements are secured in place by these details, which tend to improve the quality of the work, as well as to render the work of the contractor more easy. The ramming tightens the grip of the reinforcements to the bars, and the fewer loose members in reinforced concrete the better. The braces and stirrups grip the bars and resist sliding. The steel sections used are ordinary commercial ones, which are, of course, obtainable at the cheapest price. In the work of construction the reinforcements are not so easily displaced as they are with many loose members. The firm does not favour the use of any deformed bar. As regards the hoop braces, it is claimed that they permit of the structural column being gradually built up so as to offer no obstruction to the ramming of the concrete, thus obtaining proper consolidation with the resultant increase in strength, whereas one of the defects of the continuous spiral wrapping is the putting of the concrete in place and consolidating it. Criticism is offered that it has been found that sometimes where columns have been removed after construction on other systems, that in ramming the concrete the vertical bars have been worked towards the centre

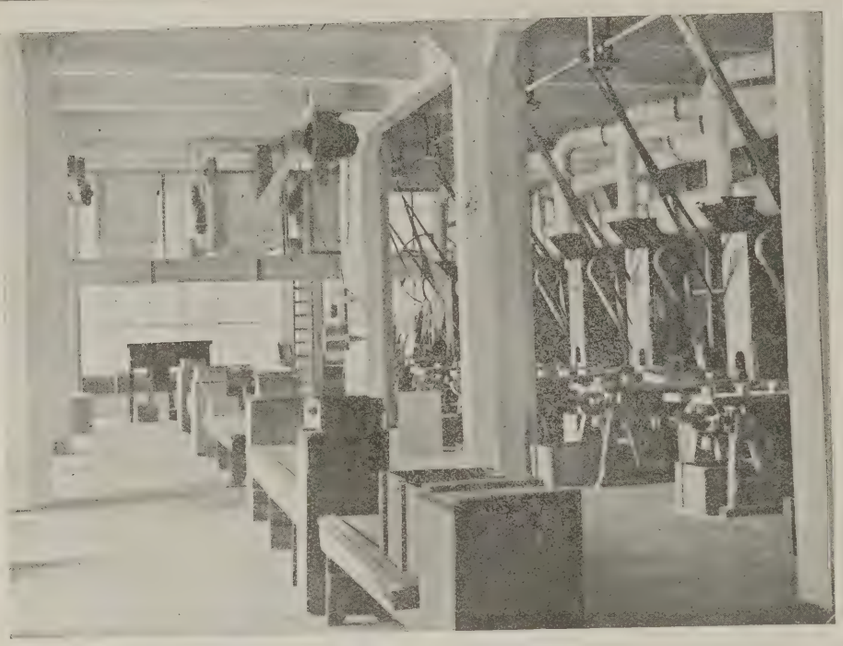

FIG. 15. WAREHOUSE FOR JOSEPH CROSFIELD & SON, LTD.

away from the hooping, so that the core became of less area than designed. It is claimed that with the Paragon hoop brace the core, which takes the principal part of the load, cannot be otherwise than the size intended.

We have referred to the tests conducted on columns, but the firm has also made numerous experiments upon the strength of beams of rectangular and T-section reinforced with their Paragon stirrups. These latter can be laid at any angle close enough to take the heaviest shearing stress, and provide a truss action by biting or locking on the main bars. We are assured that the tests conducted have shown, compared with tests on exactly similar beams—the only difference being in the form of the stirrup—that the Paragon stirrups increase the resistance with a distributed load to much more than that obtained with loose stirrups.

The firm supplies bars with the stirrups attached under the term of "The Paragon Truss Bar," these being shown in Fig. 12. The stirrups, it will be noted, are placed at an angle of 45 degrees, which is theoretically the correct angle to give the maximum efficiency.

Fig. 13 shows the application of the foregoing methods to the construction of solid and tubular reinforced concrete floors, and Fig. 14 shows details of three reinforced concrete piles with the Paragon reinforcement:—(*a*) shows a square pile, (*b*) a rectangular inter-locking sheet pile with round rod reinforcement, and (*c*) shows a similar sheet pile, using joists, however, instead of round bars for the main reinforcements.

Fig. 15 shows the interior of a large packing warehouse recently erected for Messrs. Joseph Crosfield and Son, Ltd., of Warrington. We may remark that this particular building shows the speed with which work of this nature can be carried out. The buildng has five floors and a playground roof. The foundations are deep, water having to be contended with, but the whole building was completed in four months from the commencement of the job.

As regards the general theory of stress distribution, upon which the calculations are based, this may be summed up as being practically equivalent to the report of the committee appointed by the Royal Institute of British Architects, with certain obvious modifications to suit the special system.

All hoops and stirrups are manufactured to gauge, consequently each size is identical throughout, ensuring the steel skeleton in columns, stanchions, etc., to be of the proper size and the main bars held in exact position, the result being an accurate core with the main bars all tight against the hooping. These members being always used in direct tension and shear respectively, it is an advantage to make them of harder steel than the main bars, the strength usually used being from forty to forty-five tons per square inch tensile strength, or harder for special cases.

The following is a list of a few of the more important works that have been carried out by the company, which has not been long in existence, so, naturally, the list is not a long one. It is extensive, considering the short time that the system has been upon the market:—

List of Works.

Ore bins, Kilsyth; retaining walls, Riverside, and Dock Walls, Glasgow; overhead water tank, Greenock; covered tank, Paisley; engineering shops, stores, engine beds, and foundations, Gourock; silos, Dunlop; highway bridges at Hallington and Swinburn; "Carbosil" and packing warehouse, Warrington; offices and stores, Warrington; deep foundations, Birkenhead; covered tank, Herefordshire; shops, etc., Lowton, with several floors, and smaller works. The firm have also recently had their system accepted for a large railway culvert scheme, a loading jetty on piles; a covered reservoir of 280,000 gallons capacity; an important county bridge, a large office block, and a pleasure pavilion, tenders for three of these latter schemes having been accepted.

A complaint, at Coventry, made by the United Trades' Committee, alleged that in certain instances the standard rate of wages was not being paid on some contracts in—Short Street and Narrow Lane! There is no mention of Queer Street.

Proposed New Works.

Ayr.—At a meeting of Ayr County Association under the Territorial and Reserve Force Act, on Nov. 17, the General Purposes Committee reported that plans for a new artilery drill-hall for the Irvine Battery of the Field Artillery had been approved by the committee. The estimated cost was £5,000, and the work was to proceed as soon as the sanction of the Army Council could be obtained.

Birmingham.—An enquiry has been held by Mr. R. H. Bicknell, Local Government Board inspector, with reference to an application by Birmingham Corporation for sanction to borrow £9,000 for the widening and improving of Highgate Road, and £3,525 for the construction of a boating pool in Ward End Park.

Dublin. — The Dublin Corporation propose to spend £100,000 on the completion of the city main drainage system.

Eton.—At a recent meeting of the Rural District Council, the following plans were approved:—New house in Bulstrode Way, Gerrards Cross, for the London and Country Investment and Property; new house, Packhorse Road, Gerrards Cross, for Mr. Aubrey Wright; alterations to Arran Croft drainage, Stoke Pogis, for Mr. N. H. Cooper; new house, Pitts Field Estate, Salt Hill, for Mr. E. A. Medcalf; drainage of house in Farnham Road, for Mr. W. E. Prince; new house, New Town Road, Hitcham, for Mr. W. Horwood. Also subject to restrictions—new house in Bulstrode Way, Gerrards Cross, for Mr. A. C. Cook; new house, "The Woodlands," Gerrards Cross, for Mr. A. C. Meyjes; new house in Marsham Lane, Gerrards Cross, for Mr. C. P. Lovell; drainage of Hitcham Vale, for Princess Dolgorouki; new cottage, Farnham Avenue, Farnham Royal, for Mr. A. Carter; three new houses in the Bath Road, Taplow, for Mr. C. R. Snell.

Glasgow.—A new hall in Anniesland, Glasgow, is the first hall in Glasgow to be planned in the amphitheatre style, the gallery rising from the floor. The hall seats 1,000, and has cost £10,000. The architect was Mr. H. Campbell, of Glasgow.

Glasgow.—The Glasgow Coporation Sub-Committee on Hospitals report that they have had before them a statement by Mr. A. B. McDonald, city engineer, in connection with the proposed erection of a permanent smallpox hospital at Robroyston. For permanent buildings the cost is estimated at—first section, £76,924; second section, £52,876 11s.; and completed scheme, £129,800 15s.; while for temporary buildings the estimate is—first section, £68,227; second section, £31,002; and completed scheme, £99,229. Each estimate is exclusive of furnishing and equipment. The sub-committee recommended that, before pronouncing on the subject, the Town Clerk be instructed to forward the plans to the Local Government Board for approval. This was approved by the Health Committee.

London.—The London County Council has consented to the following new works:—Erection of an addition to the South-Western Polytechnic to abut upon the western side of Manresa Road and the southern side of Trafalgar Square, Chelsea, on the application of Mr F. G. Knight, on the behalf of the governing body of the Polytechnic. Erection of Nos. 88 and 90, Standen Road, Wandsworth, with an irregular open space at the rear of No. 88, and with the boundary fence of No. 90 at less than the prescribed distance from the centre of the footway leading from Standen Road to Longfield Street, on the application of Messrs. P. and E. Mulliner. Erection of a building with a one-storey shop in front, upon the site of 188, Rye Lane, Peckham, on the application of Mr. H. E. Hill, on behalf of the Magnet Printing Press Company, Ltd. Erection of a house on the southern side of Logan Place, Kensington, with a chimney stack, eaves, rain water and soil pipes, and gutter projecting into the open space provided at the rear, and also erection of a projecting hood over the entrance doorway and retention of a forecourt fence at less than the prescribed distance from the centre of the roadway of Logan Place, on the application of Mr. E. W. Marshall, on behalf of Mr. C. Rea. The Council extend the time within which the erection of buildings upon the site of Nos. 8 to 14, Wild Court, Holborn, was required to be commenced and completed, and also consent to a further deviation from the plans approved on 18th July, 1905, under sections 13 and 43 of the London Building Act, 1894, for the erection of the said buildings so far as relates to the erection of an addition thereto, on the application of Messrs. Brown and Barrow.

Rawtenstall.—At a recent meeting of the Town Council, the following were among the plans approved:—New boiler-house and chimney at Pike Law Workhouse, for the Board of Guardians, of Haslingden Union; two houses at Bacup Road, Waterfoot, for Mr. Thomas Birtwistle. There were also approved several plans for minor operations.

Waterford.—The Viceregal Commissioners, appointed some time ago, recommend a new bridge across the river at Waterford, on the site of the present wooden toll bridge, and estimate the cost at £97,000, together with £10,000 for a temporary bridge for the time (about 3 years) the new bridge is supposed to take in its construction. The bridge will be on the girder principle, with two spans of 276 ft., and a centre opening span of 80 ft. This latter span will open and shut in 1½ minutes by hydraulic power.

Federation News.

THE INTERNATIONAL CONGRESS IN PARIS.

By Our Special Commissioner.

The proceedings in connection with the third International Congress of Contractors for Building and Public Works, held in Paris from November 15th to November 19th, began with an evening reception at the headquarters of the French Federation of Building Trade Contractors. M. Soulé, the President of the French Federation, welcomed the numerous delegates.

The Opening Meeting.

Next day the Congress was formally opened at a general meeting, over which a representative of the Government (M. Chapsal) presided. The sitting was numerously attended. M. Soulé, as president of the Congress, mentioned that some 250 delegates representing fourteen European States, and 250 delegates representing the French provincial associations with, in addition, the Parisian members, were attending the Congress. He suggested that the progress that was being made indicated that the time was ripe for establishing an International Federation of Building Trade Contractors.

M. Villemin, general secretary of the French Federation, outlined the business which was about to occupy the attention of the Congress, and in particular emphasised the need there was for a solution of the following questions:—(a) The guarantees demanded by public bodies from contractors prior to their being allowed to tender, together with improved methods of tendering; (b) the difficulties which stand in the way of better arbitration methods; (c) the need for the proper training of apprentices.

The representatives of the various countries were in turn invited to say a few words, and the chairman wound up the proceedings by expressing the sympathy which the Minister he represented (the Minister of Commerce and Industry) had for the objects sought by the Congress.

Conference and Visit to Tube Railway.

In the afternoon a short conference was held, when the contractor for the Paris Tube Railway (M. Chagnaud) explained the plans and methods of work of the section passing under the Seine, near Notre Dame Cathedral, then in course of construction. Afterwards the works themselves were visited. The plans showed a tube with double lines of rails instead of the twin tubes usual in this country, but in other respects and in principle did not differ from the practice here. The work was being carried out under serious difficulties in the shape of water and running sand, which has to be frozen to enable it to be removed.

Real Work of the Congress Begins.

The following day the real work of the Congress began. Three sections had been constituted, and sat simultaneously. The meetings were very well attended, and the debates well sustained, some of the speakers (notably MM. Galeoti and Villemin) being particularly effective.

Burning Questions.

The burning questions evidently were the methods of letting contracts by administrative bodies, the guarantees they demand from contractors both before and in connection with the letting of the contract and the question of the training of apprentices.

Methods of Letting Contracts.

The time-honoured method of letting contracts in France is that based upon a schedule of prices prepared by the administration for the work in question. Upon this as a basis contractors are expected to bid. The system appears to have given rise to serious abuses, the adjudication or letting being done in public, and the contractors allowed to underbid each other in a most objectionable manner. In short, the letting of a contract for a public work becomes a kind of inverted auction sale. By another method, the contractors are required to produce competition schemes complete in all details, and to undertake the works on a lump sum basis, the tender covering all eventualities. This method has certain advantages where the contractors are given a sufficiently free hand, but the onerous conditions imposed by the administrations, especially as to the wages payable to workmen and the hours and conditions of labour, and the lack of adequate relief in cases of strikes or lock-outs, has so far deprived the contractor of his liberty of action as to make it very difficult now for any responsible contractor to tender under this system.

The desire appears to be to adopt a system akin to that in general use in England, and also by railway companies in France, where the administration specifies its requirements, and issues bills of quantities, upon which the contractors base their tenders. It is significant, however, of the newness of this method in France that it does not seem to be expected that the quantities should be guaranteed, or in any case made part of the contract; on the contrary, it is suggested that the approximate quality of the quantities will necessitate a serious study of the nature of the works by the contractor before venturing to submit a tender, and have for result, therefore, the submission of well-considered tenders by men who know their business. In England, building contractors expect the quantities to be guaranteed, or, failing that, made part of the contract, so that any errors may be rectified at the completion of the works. It is not, however, desired to abandon entirely the earlier method, especially for large public works of a novel character; but resolutions were adopted tending to improved regulations and a combination of the methods referred to.

Contract Guarantees.

As regards the question of guarantees, some of these are merely annoying, as when a contractor is required to produce a certificate of good personal character and an extract from the judicial register to the effect that he has never been fined or imprisoned before permitting him to tender. Others are more serious, such as requiring the deposit of a sum of money, equal to 1-30th or more of the value of the proposed works, before permitting a tender to be submitted; further, requiring a similar sum to lie in the hands of the administration during the whole period of the contract, and, in addition, deducting retention money to the extent of fully 10 per cent. of the value of the work done. The English practice of sureties, either by personal bond or insurance bond, does not seem to be practised in France, at all events as regards contracts for public works. The resolutions proposed are, in effect, a sweeping away of the less serious annoyances, and for those that are more serious the substitution of moderate but reasonable reforms, such as being content with a promise to provide sureties if and when a contractor's offer is accepted, and the repayment at intervals of the guarantee in proportion to the amount of money retained as the works proceed; also that retention money never exceed ten per cent. of the amount of contract.

The Apprenticeship Question.

The question of apprenticeship seems, however, to overshadow the rest at this moment. As the result of ill-considered legislation in regard to the hours of labour by which the young persons, who may only work ten hours a day, are not permitted to work in the same workshops or on the same jobs as the workmen, whose day is one of eleven to twelve hours, the apprenticeship system formerly in vogue has been practically killed, and such a scarcity of good workmen has been brought about that the contractors find themselves forced into action. The chief speaker on this subject was M. Villemin, and his eloquent and masterly handling of the question, in a speech of over an hour's duration, and without notes, was a remarkable effort. His argument was that just as no employer would dream of asking the State to renew his labour-saving machinery when it wears out or becomes antiquated, so no employer ought to dream of asking the State to provide him with trained workmen who were, economically considered, in reality human machines in their services to industry. He, therefore, asserted, as a principle, that the employers in industries must rely upon their own initiative in the matter of training apprentices. He did not, however, suggest that the employers' associations should assume the sole responsibility for this work, because to do so would imperil their existence, since the cost would fall on those employers only who were members, and would, therefore, make it more advantageous to an employer to remain unassociated. Neither did he wish the State to take the matter up and establish manual schools, since that would mean the creation of expensive buildings and a technical staff, and would saddle industry with an enormous burden. In order that State interference should be as far as possible excluded, and yet every employer be compelled to do his share in the work of training apprentices, he proposed that to chambers of commerce or other similar bodies representative of every industry should be given by law the mission of providing such training; that the instructors should be drawn from the ranks of those employers and workmen practically engaged in the respective industries; and that their remuneration nd the other expenses should be provided for by a fund to which every employer should be bound to contribute. In some centres, manual training schools might be necessary, but the system he advocated was designed to be so elastic, and to leave in the hands of those responsible such latitude as would enable manual training to be given in every hamlet in France. The manual training to follow on as soon as the child leaves school (in France at about twelve years) and be continued until he is sixteen years of age. This system to be accompanied by an amendment of the existing law, so that apprentices may work in the same shops and on the same works as workmen, even though the latter work longer hours than are permitted to apprentices. That apprenticeship should be obligatory on those who desire to enter an industry, and that every apprentice should be obliged to produce a certificate of training and apprenticeship before being being admitted a journeyman. He praised the Danish system, which, he said, resembled that for which he now con-

tended, and required every apprentice at the end of his term to prove, by practical test before a competent jury, his title to be admitted a journeyman. The Danish system has proved so successful that the general practice there is for the workman to prefer to work by the piece rather than by the hour, and the supply of labour is ample and of excellent quality. The meeting strongly endorsed M. Villemin's views, and passed a series of resolutions to that effect.

Methods of Arbitration.

A question of subsidiary importance was that relating to methods of arbitration and the settlement of disputes connected with building contracts by experts. It appears that the existing system has given rise to a class of professional experts who make a living out of such disputes, and are more concerned to justify their existence than to render prompt and cheap justice to the parties; consequently arbitration is so expensive and unsatisfactory that employers resort to it with great reluctance. The resolutions passed ask for the right of either disputant to have disputes referred to arbitration, the establishment of panels of representatives drawn from the architectural, engineering, etc., professions, and from the associations of the various industries, from which panels all arbitrators are to be chosen. That there be no appeal allowed from the decision of such arbitrator or arbitrators. That when the assistance of experts is required, these are to be chosen from among similar panels, constituted from nominations made by the respective professional and industrial societies, and that professional experts be abolished. That all contracts for works be subject to an arbitration clause providing for the reference of disputes on the above lines.

Workmen's Compensation Law.

Consideration was also given to the question of some revision of the law as to workmen's compensation for accidents received during work. The growth of the demands for compensation has been very great, and now calls for insurance rates largely in excess of those prevailing in this country for similar risks; and, while agreeing that compensation for industrial accidents is rightly due to the workman, the system under the present law in France has led to great abuses, and modifications of the law are, therefore, asked for.

International Federation.

Finally, a proposal was outlined for the formation of an International Federation of those connected with building and public works, which proposal was referred to the existing permanent committee of the Congress for further study and elaboration. Proposals for such a federation will later be submitted to the existing building trade organisations in each European country. The ideas enunciated are very far-reaching, and merit the very serious consideration of all connected with the industry; but it would be premature to discuss them at the moment.

Utility of the Congress.

Certainly the proceedings of the Paris Congress showed how valuable such a combination may be. Being held in France, the matters under discussion were largely debated from the point of view of French employers. The result is likely to be that the discussion will excite so much attention in that country that opinion will be clarified and consolidated, and given a direction and force which is likely to yield substantial reforms. The representatives of the various countries will also take back with them clearer views in the problems they have at home, and be encouraged either to find solutions on the lines recommended by the Congress, or to bring their problems before a future Congress.

Venue of the Next Congress.

The next Congress will be held in Italy, when the building employers of that country will find their opportunity to invoke and proclaim the opinion of the building trade employers of nearly a score of countries on such abuses and grievances as may there press for alleviation.

The Language Question.

The language question, however, requires dealing with in future Congresses, if they are to fully attain their object. At present French is the language of the Congress. Some method is desired by which the papers may be published in at least four languages, and each speaker allowed to address the Congress in his own tongue. It is understood that some such change is contemplated.

Places of Interest Visited.

In connection with the Congress there were visits to the Hotel de Ville, to an interesting school for professional training of builders and architects, and to the Conservatoire of Arts and Crafts; also a theatre party, to which all who attended the Congress were invited. A banquet, at which some 400 persons were present, brought to a close a very successful gathering. The greatest attention and kindness were shown to the foreign delegates.

THE R.I.B.A. AND THE HOUSING AND TOWNS PLANNING BILL.

The subjoined letters on the subject of the Housing and Towns Planning Bill, addressed from the Royal Institute of British Architects to the President of the Local Government Board, and duly acknowledged, were published last week. The deputation referred to in the opening paragraph of the January letter had waited upon Mr. John Burns some weeks previously, and urged that provision should be made in the Bill for the formation of advisory committees composed of experts to be consulted in all matters connected with the preparation of town plans and plans for town extension.

January, 1908.

The Right Hon. John Burns,
President of the Local Government Board.

SIR,—You received our deputation on the 3rd December last with such frankness and courtesy that we venture once more to lay our views before you on certain points which escaped discussion at our interview. We fully admit the weighty reasons you gave for proceeding cautiously in this matter, the immense value of town sites, the necessity of considering the hinterland of great thoroughfares, together with political considerations, which lie outside our province; but we feel that in the preparation of any scheme for the laying out of towns there is a very intimate relation between the artistic aspect of the question and the dignity of civic and national life which is in danger of being overlooked. It seems to us that the problem of enlisting in the service of the State the most competent advice in dealing with such matters is worthy of the serious consideration of statesmen, the more so as the attempt has not been made in this country on any organised system. In this matter of the relation of public authority to trained architectural opinion this country is, and has always been, far behind others.

We venture to return to this matter, because, in the Bill of which you very kindly gave us a general outline, although there appears to be ample provision of powers of control and regulation, we did not gather that there is provision for preparing town plans as understood in other European countries, or for enlisting the assistance of architectural opinion. We venture to hope that the Bill will provide for these important matters on a comprehensive scale, for we submit that no satisfactory scheme of town planning can be drawn up without architectural advice, inasmuch as no other profession has the requisite training for dealing with such problems. Architecture is concerned not only with individual buildings, but also and very particularly with the proper placing of buildings in relation to each other, and with considerations of spacing, of vista, perspective and composition, problems which demand special study and powers of design of a high order. At the interview which you were kind enough to grant us, this larger aspect of municipal planning was hardly brought into sufficient prominence.

The point which we would put before you is that the satisfactory laying out of towns and planning of municipal improvements is in the main a question of design; that is to say, given the data supplied by the engineer, the surveyor, the sanitary and local authorities, there still remains the question who is to mould these elements into the best possible form—for the work of the engineer and surveyor is contributory rather than final. As the necessary complement to their work, another order of mind is required, and that in the initial stages of the scheme. We would urge that the practical and the artistic sides of town planning are inseparably connected, and that no scheme can be wholly satisfactory which does not satisfy both aspects of the matter. It is in regard to the artistic aspect that we make our suggestions.

We submit that the translation of the various practical conditions into the best possible scheme is a problem of architectural design, and as such should have the benefit of the best architectural assistance it is possible to obtain.

We would point out that in France special importance has always been attached to this power of laying out public spaces, which is an essential function of architecture. It does not fall within the scope of professions into whose training æsthetic considerations do not enter. It is generally admitted that for the last two hundred years or more the French have shown other countries the way in the handling of large problems of town planning, and the reason for this superiority lies not so much in individual ability as in a great tradition of design built up by the successive General Councils of Civil Buildings, which are composed for the main part of the ablest architects of their time in France. We suggest that, having regard to the constant development, rebuilding, and rearrangement of towns entailed by the changing conditions of modern civilisation, the time has come for a more systematic and comprehensive treatment of these problems, and that an attempt should be made to bring the best architectural opinion into play in dealing with these matters.

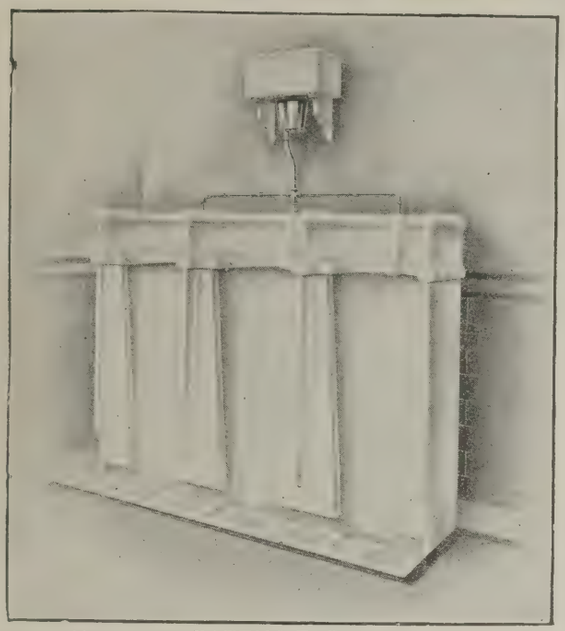
We feel that it would be greatly to the interest of the larger towns of this country that their development and extension should proceed on carefully considered general plans drawn up to meet local conditions and on lines sufficiently broad to admit of such minor modifications as may be necessary in succeeding generations. We feel that without some such provision the difficulties which already meet us, and are already beyond control, will recur in the future in an aggravated form. It is more particularly in connection with this aspect of town planning that we suggest to you the desirability of devising some machinery for the enlistment of competent advice.

Should you consider this desirable, the Royal Institute of British Architects will feel honoured by being permitted to submit suggestions for your further consideration.—We have the honour to be, Sir, your most obedient Servants,

THOMAS E. COLLCUTT,
President R.I.B.A.

ASTON WEBB,
Chairman of the Town Planning Committee R.I.B.A

17th July, 1908.



The Right Hon. John Burns, M.P.,

SIR,—I am desired by the Council of the Royal Institute of British Architects to refer you to their letter of January, 1908, on the subject of the Housing and Towns Planning Bill, and to request that the Royal Institute of British Architects should have specific permission to make recommendations or representations as "persons affected" at inquiries held by the Local Government Board before the approval of town planning schemes.

It is understood that this was indicated by the speech in which you moved the second reading of the Bill, and by paragraph 2 (c) of Schedule III., but it is considered desirable by the Council that it should be more clearly defined in view of the importance of the artistic side of such schemes being fully considered. The Council would also be glad to know if the Bill will require that, in the case of schemes for the laying out of estates by private owners (which may have received the approval of the local authority), there will be an appeal to the Local Government Board from the decision of the local authority.—I have the honour to be, Sir,

Your obedient Servant,
IAN MACALISTER,
Secretary, R.I.B.A.

Mr. Burns's stolid unresponsiveness seems to require explanation. The subject is dealt with briefly and tentatively in an editorial note that appears on p. 420 of the present issue.

No. 1530.—PATENT TAPER URINALS.

Urinal Ranges

DESIGNED AND MANUFACTURED BY

THE LEEDS FIRECLAY COMPANY, Ltd.,

ARE CHARACTERISED BY

(1) The minimum number of joints, thus reducing liability to leakage.
(2) The rounding of all internal angles, thus allowing no part to become foul.
(3) Easy accessibility to all parts.
(4) The open channels admitting of easy cleaning.
(5) Hardness and strength of the burnt material.
(6) Highly glazed impervious surface.

Designs and Estimates submitted for all kinds of Sanitary Ware for

Private Houses, Public Buildings, Railway Stations, Hotels, Schools, Offices, Workshops, &c

THE LEEDS FIRECLAY COMPANY, LTD.,

Head Office: WORTLEY, LEEDS.

LONDON OFFICES & SHOWROOMS: 2 and 3, Norfolk Street, Strand, W.C.

—ALSO AT—

LIVERPOOL: 21, Leeds St. HULL: Alfred Gelder St., South Side, Queen's Dock. BIRMINGHAM: 1, Edmund St.
NEWCASTLE: 4, Northumberland Street.

THE "RENTON" PATENT GLAZED FACING BRICK.

The "RENTON" Patent Glazed Facing Brick is specially adapted to form a durable facing to Ordinary Brick Walls at a period subsequent to their erection, also for lining Swimming Ponds and for export trade, where its great reduction in weight secures a large saving in cost of Freights, etc.

Brick Walls to receive this facing require only to be built in "Old English" bond with the Headers of their alternate courses brought forward an inch over the stretcher courses or snapped an inch short, and into the grooves thus left the "Renton" Patented Bricks (which are reversible on section) are built forming a facing of Glazed Bricks, constituting an integral part of the wall.

Considerable saving in cost is effected both for Home and Export Trade. Walls faced with the "RENTON" require only 48 bricks to the yard super., whilst ordinary "Flemish" Bond take 63 bricks and "Old English" Bond 72 bricks. It may be taken that 1 yd. super. of ordinary Glazed Bricks "Old English" Bond would weigh, without packing about 500 lb., whereas the approximate weight of the same area of "Renton" Patent Bricks would be 150 lb., a saving of THREE-FOUTHS in the COST OF CARRIAGE AND FREIGHT.

The LEEDS FIRECLAY, COMPANY Ltd.,

Head Office: WORTLEY, LEEDS.

Offices: ADVERTISEMENT, EDITORIAL AND COUNTING HOUSE—Caxton House, Westminster. PUBLISHING—6, Great New Street, Fetter Lane, E.C.

Telegraphic Address: "Buildable, London."

Telephones: ADVERTISEMENT, EDITORIAL AND COUNTING HOUSE—364, Westminster. PUBLISHING—2200 Holborn (six lines).

Date of Publication:—The BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER is published every Wednesday, price 2d.

A Special Section is regularly presented free with the ordinary issue, three weeks out of every four. These three regular monthly supplements are entitled "Contractors' and Federation Section," "Concrete and Steel Section," and "Fire-resisting Construction Section" respectively.

The Subscription Rates per annum are as follows:—

	s.	d.
At all newsagents and bookstalls	8	8
By post in the United Kingdom	10	10
By post to Canada	13	0
By post elsewhere abroad	17	4

The Index (with Title Page) for each half-yearly volume is supplied free on application to the Publisher.

Subscribers can have their volumes bound complete with Index, in cloth cases, at a cost of 3/6 each.

Advertisements for the current week, alterations to serial advertisements, etc., must reach the office not later than first post on Saturday.

Rates for Serial Advertisements, Special position etc., sent upon application.

Situations Wanted—
4 lines (about 28 words), one insertion - 1s. 6d.
Each additional line - - - - - 6d.
Three insertions* - - - - - 3s. 0d.

*This includes 6 weeks under Employment Register.

Situations Vacant. Miscellaneous, Drawings and Tracings, Educational, Competitions Open, Partnerships, etc., per 6d. line.

The above must be prepaid.

Property and Land Sales, Legal Notices, etc., 9d. per line

Advertisements for the above can be received up till 5 o'clock on Monday Evening at

CAXTON HOUSE, WESTMINSTER.

Tenders.

Addressed postcards, on which lists of tenders may be stated, will be sent free on application to the Manager, BUILDERS' JOURNAL, Caxton House, Westminster.

Information from accredited sources should be sent to "The Editor," at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Cambridge.—For the erection of a shop front, Fitzroy Street, Cambridge, for H. P. Tyler, Esq. Mr. J. W. Pate, architect, 16, Parker Street, Cambridge:—

J. Newman and Sons	£96 15 0
Clark and Sons	91 7 0
John Brignell	90 17 8

Architect's estimate, £108.

Cinderford (Glos.).—For erection of a new higher elementary school at Cinderford, for the Gloucestershire Education Committee:—

E. J. Flewelling, Lydbrook	£4,946 0 0

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Dec. 3. GUEFFORDD.—Erection of a new schoolroom, dwelling-house, and stabling, adjoining C.M. Chapel, Geufford near Guilsfield. Plan and specification, or copies of the same, can be seen at the house of D. Jones, Broniarth Hall, Guilsfield, or at the office of G. Dickens-Lewis, architect, Talbot Chambers, Shrewsbury. Estimates, sealed and endorsed "Tender for Schoolroom," etc., are to be delivered to Mr. Jones not later than 12 o'clock mid-day on Dec. 3.

Dec. 4. STOTFIELD.—Erection of dwelling-house at Stotfield. Estimates are wanted for the mason, carpenter, slater, plumber, plaster, painter, and glazier works. Plans and specifications may be seen with C. G. Doig, architect, 149, High Street, Elgin, and offers lodged with him not later than Dec. 4.

Dec. 5. NORTH RAUCEBY.—Erection of two small farm-houses and the erection and alteration of farm buildings at North Rauceby, for the Kesteven C.C. Builders willing to tender should make written application before Dec. 5, to W. Mortimer and Son, architects, Lincoln.

Dec. 5. ABERAVON, Port Talbot.—Erection of a parsonage house for the Vicar of Aberavon. Plans, etc., may be seen at the office of J. A. James, architect, Port Talbot, and bills of quantities obtained, upon receipt of a cheque for £2 2s. Tenders must be delivered not later than Dec. 5.

Dec. 5. MANCHESTER. — Pointing brickwork, coping, etc., and making good generally 122 cottages, Miles Platting, for the Improvement and Buildings Committee. Specification may be obtained at the office of city architect, Town Hall, Manchester, upon payment of £1 1s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Sealed tenders, enclosed in the official envelope, to be delivered at the above office not later than 9 a.m. on Dec. 5.

Dec. 5. PALTERTON.—Erection of proposed Council school at Palterton, near Chesterfield, to accommodate 120 infants, for the Derbyshire C.C. Persons desirous of tendering for the work may see the drawings, specification, agreement, etc., at the office of the architect to the committee, St. Mary's Gate, Derby, between the hours of 10 a.m. and 4 p.m., except on Saturdays, when they will be on view from 10 a.m. to 12 noon. A copy of the bill of quantities, specification, conditions of contract, and form of tender can be obtained at the architect's office upon payment of £1 1s. Sealed tenders, in envelopes provided for the purpose, endorsed "Tender for Palterton Council School," must be delivered to G. H. Widdows, A.R.I.B.A., architect to the Committee, County Education Office, St. Mary's Gate, Derby, not later than 1 p.m. on Dec. 5. Securities required.

Dec. 7. ALDERSHOT.—Certain works to be carried out at the cemetery, for the Burial Board. Plans and specifications can be obtained from Friend and Lloyd, architects, Aldershot. Tenders, marked "Tender for Work at Cemetery," to reach N. Clinton, clerk, Station Road, Aldershot, not later than Dec. 7.

Dec. 7. LEEDS.—Pulling down and rebuilding a portion of the retaining wall supporting the Leeds and Bradford Road, situated between the Leeds and Liverpool Canal, and the Midland Railway Company's station at Kirkstall. The drawings, specification, etc., may be seen, and bill of quantities obtained at the office of W. T. Lancashire, city engineer, Municipal Buildings. Tenders, properly endorsed, must be received at the town clerk's office not later than 10 a.m. on Dec. 7.

Dec. 7. GALWAY.—Erection of a new fever hospital at Galway, for the Board of Guardians, in accordance with drawings (amended), prepared by their architect, A. Cowlishaw, Brentwood, Saltihill, Galway. Plans and other particulars may be seen at the architect's office any day (Sunday excepted) between the hours of 10 a.m. and 4 p.m. Quantities will be supplied by the architect on deposit of £2 2s. Securities required. Tenders forms of which will be supplied by the architect), endorsed "New Fever Hospital," will be received by R. F. Mullery, clerk of union, Galway, up to, but not later than, 4 o'clock p.m. on Dec. 7.

Dec. 9. PORT TALBOT.—Erection of Masonic Temple at Forge Road, Port Talbot, for the "Afan" Masonic Lodge. Plans and specification may be seen at the offices of J. A. James and T. Gibb, joint architects, Port Talbot, and bills of quantities obtained on receipt of £2 2s. Sealed tenders, endorsed "Masonic Temple," to be sent to F. W. Page, Ael-y-Bryn, Pentyla, Aberavon, on or before Dec. 9.

Dec. 9. LAMLASH.—Repairs of Lamlash Timber Pier. Plans and specification can be seen and schedule of measurements obtained from D. and C. Stevenson, civil engineers, 84, George Street, Edinburgh. A deposit of £1 must be made for copy of schedule. Tenders are to be lodged with the above on or before Dec. 9.

Dec. 9. LONDON, E.—Works in connection with certain of the gutters to existing buildings at the Forest Gate Branch Workhouse, for the Guardians of the Poplar Borough, in accordance with specification prepared by their architects, J. and W. Clarkson, 136, High Street, Poplar, E. Persons desirous of tendering for the work must send their names to the architects not later than December 2. The conditions of contracts may be seen at the offices of the architects as above and a copy of the specification and form of tender obtained on payment to the architects of a deposit of £2 2s. Tenders, sealed and endorsed "Tender for Works to Gutters at the Forest Gate Branch Workhouse," addressed to G. H. Lough, clerk to the Guardians, at 45, Upper North Street, Poplar, E., must be delivered not later than 6.30 p.m. on Dec. 9. The successful contractor will be required to only employ the men whose names are on a list which will be supplied to him from time to time by the Poplar Distress Committee or the Poplar Employment Exchange. The contractor is at liberty, however, to choose and employ a foreman independently of the Poplar Distress Committee or the Poplar Employment Exchange. Fair wages clause.

Dec. 10. SEVEN SISTERS.—Erection of new hotel, stables, etc., at Seven Sisters, for E. E. Bevan, Neath. Plans, and specification, and bill of quantities may be seen at the offices of J. C. Rees, architect, Parade Chambers, Neath. Sealed tenders to be sent in by Dec. 10, endorsed "Tender for New Hotel."

Dec. 12. TRESWITHIAN.—Erection of new Sunday-school and renovation of the present chapel, for the Trustees of the Wesleyan Chapel, Treswithian, near Camborne. Plans, etc., may be seen by appointment at the residence of J. Holman, Treswithian, or at the office of S. Hill, architect, Green Lane, Redruth. Tenders must be sent in by Dec. 12.

Dec. 14. DARTON.—Erection of a new school at Darton, for the West Riding Education Committee. Plans may be seen and quantities obtained on application to Crawshaw and Wilkinson, architects, 13, Regent Street, Barnsley. A deposit of £1 must be paid to the West Riding treasurer, and sent to him direct at the County Hall, Wakefield. Tenders must be delivered by Dec. 14.

Dec. 14. BRIDLINGTON.—Erection of a pumping station at the Higher Waterworks, Bridlington, for the B.C. Specification, bills of quantities, general conditions and form of tender, may be obtained from, and the drawings inspected, at the office of E. R. Matthews, A.M.I.C.E., borough surveyor, Town Hall, Bridlington, on payment of a deposit of £1 1s. Sealed tenders, endorsed "Pumping Station," to be received by A. E. Matthewman, town clerk, Town Hall, Bridlington, on or before Dec. 14.

Dec. 15. LONDON, W.—Erection of proposed new public offices at Acton, for the Acton U.D.C., in accordance with plans prepared by and under the superintendence of W. H. Raffles and J. B. Gridley, architects, 10, Gray's Inn Square, London, W.C. Plans and specifications can be seen at the offices of Raffles and Gridley, and bills of quantities can be obtained, after Dec. 8, from Matthews and Coleman, 11, Old Queen Street, Westminster, S.W., on payment of the sum of £1 1s. Securities required. Tenders, endorsed "New Public Offices," to be addressed and delivered to W. Hodson, clerk to the Council, Council Offices, 242, High Street, Acton, W., on or before 3 o'clock p.m. on Dec. 15. Canvassing will disqualify.

Dec. 16. BIRMINGHAM.—Erection of additional workshops, etc., at the public lighting department, Park Street, Birmingham, for the Public Works Committee. The drawings and specification may be seen, and quantities and forms of tender obtained at the office of H. E. Stilgoe, M.Inst.C.E., city engineer and surveyor, the Council House, Birmingham, on deposit of the sum of £3 3s. Fair wages clause. Tenders, sealed and endorsed "Tender for Additional Workshops, etc., Park Street," and addressed to the Chairman of the Public Works Committee, will be received at the office of H. E. Stilgoe, as above, not later than December 16.

Dec. 18. MARGATE.—Erection of new post-office at Margate, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster. Bills of quantities and forms of tender may be obtained at the undermentioned address on payment of £1 1s. Tenders must be delivered before 12 o'clock noon on Dec. 18, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W., and endorsed "Tender for Margate New Post Office."

Dec. 21. PADIHAM.—Erection of a new elementary school at Padiham, near Burnley, to accommodate 620 scholars, for the Lancashire Education Committee. The plans may be seen and bills of quantities obtained at the office of H. Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on Dec. 21, sealed and endorsed, to F. Shutt, Education Office, Padiham.

Dec. 31. SOUTHEND-ON-SEA. — Construction of a new pavilion ward at the Sanatorium, Balmoral Road, Southend-on-Sea, for the Corporation. Plans, sections and specification may be seen, and bill of quantities and form of tender obtained, on deposit of cheque for £1 1s., upon application to E. J. Elford, M.I.M.E., borough surveyor, Southend-on-Sea. Sealed tenders, endorsed "Pavilion, Sanatorium," to be delivered at the office of W. H. Snow, town clerk, Town Clerk's Office, Southend-on-Sea, before 12 o'clock noon on December 11. No tender will be considered unless made on the prescribed form.

No date. ST. HELENS.—Erection of a new monastery at St. Helens Junction. Builders and contractors desirous of tendering can have quantities and particulars from R. Curran and Son, architects, Warrington, on deposit of £2 2s.

No date. ALDERSHOT.—Erection of two cottages and motor garage, Grosvenor Road, Aldershot. Plans and specifications may be seen and any further information obtained upon application to Friend and Lloyd, architects, Aldershot.

No date. STAFFORD.—Erection of a new mission hall, for the Trustees of the Wesleyan Church, Rowley Street. The drawings and specification may be seen, and bill of quantities and all particulars obtained, on application to C. W. D. Joynson, architect, Springhead, Wednesbury, upon payment of the sum of £1.

No date. FYNING COMMON.—Erection of a detached dwelling-house, at Fyning Common, within two miles of Rogate Station. Those desirous of tendering are requested to apply to Stride and Son, East Street, Chichester; or to W. R. Howell, A.R.I.B.A., 5, York Buildings, Adelphi, W.C.

No date. TREFRIW, N. Wales.—Erection of a new Welsh Calvinistic Methodist Chapel at Trefriw, N.W. (the estimates are to be in two parts, with and without a spire). Persons desirous of tendering are requested to send in their names to G. Dickens-Lewis, architect, Talbot Chambers, Shrewsbury, together with a cheque for £2, when they will be supplied with the bills of quantities, form of tender, and full particulars. Drawings, or copies of the same may be seen at the house of R. Roberts, secretary to the Building Committee, Bron Derw, Trefriw, or at the office of the architect. Tenders, sealed and endorsed, are to be sent to the secretary by the time mentioned in the particulars. The contractor whose estimate is accepted will be required, if necessary, to enter into a bond for the satisfactory completion of the contract.

ENGINEERING.

Dec. 7. BILLERICAY.—Supply and fixing of laundry machinery and fittings at their Workhouse laundry at Billericay, for the Guardians of the Union, to which alterations and additions are about to be made. Plans and specification may be seen, and a form of tender, on application to R. J. W. Layland, architect, of Billericay. Sealed tenders, endorsed "Laundry Machinery," to be delivered to C. E. Lewis, clerk, New Road, Brentwood, not later than Dec. 7.

Dec. 7. NEWCASTLE-ON-TYNE.—Supply and delivery of 660 yds. of 6 in. C.I. water pipes and

150 yds. of 12 in. C.I. water pipes, for the Bedlingtonshire U.D.C. Further particulars, specification, and form of tender may be had on application to J. E. Johnson, surveyor, Bedlington. Sealed tenders, marked on the outside "Tender for Water Pipes," to be sent to D. Forster, clerk of the Council, Clerk's Office, 24, Grainger Street West, Newcastle-on-Tyne, not later than 12 o'clock noon on Dec. 7.

Dec. 8. LONDON.—Supply of bridgework for the Secretary of State for India in Council. The conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that office by 2 o'clock p.m. on Dec. 8, after which time no tender will be received.

Dec. 8. CRUMPSALL.—Reconstruction of the bridge carrying Waterloo Street over the River Irk, etc., Crumpsall, for the Improvement and Building Committee of the Manchester Corporation. Drawing may be seen and specification, bill of quantities and form of tender obtained on application at the City surveyor's office, Town Hall, Manchester, on payment to the city treasurer of £2 2s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelope addressed to the chairman of the Improvement, etc., Committee, are to be delivered at the city surveyor's office not later than 10 a.m. on Dec. 8.

Dec. 8. BRIGHTON.—Laying of certain 6 in., 4 in. and 3 in. water mains, and other works, for the purpose of supplying water to the parish of Lancing, for the Brighton B.C. The specification and form of tender may be obtained on application at the office of H. Talbot, town clerk, Town Hall, Brighton, where sealed tenders, addressed to him and endorsed "Tender for Laying Water Mains," must be left before ten o'clock in the forenoon on Dec. 8.

Dec. 9. MANCHESTER.—Supply, delivery and erection at their Stuart Street Generating Station, of exhaust, steam, circulating water and air pump discharge pipes, for the Electricity Committee. Specifications and form of tender may be obtained on application to F. E. Hughes, secretary, Electricity Department, Town Hall, Manchester, on payment of a deposit fee of £1 1s. Further particulars and information can be obtained from S. L. Pearce, chief electrical engineer, Dickinson Street, Manchester. Tenders, duly endorsed and addressed to the chairman of the Electricity Committee, must be delivered at the Town Hall before 10 a.m. on Dec. 9.

Dec. 10. GLASGOW.—Construction and repair of the embankments on the north side of the river Clyde. Plans and sections may be seen and specifications and forms of tender obtained on application to the city engineer, at his office, City Chambers, 64, Cochrane Street. Sealed tenders, marked outside "Tender for Repair, etc., of Banks of Clyde," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than Dec. 10.

Dec. 18. CASTLE CARY.—Construction of the Castle Cary Water Co.'s works at Castle Cary, Somerset. The works include the building of engine house and reservoir, laying mains, and incidental matters. The work is arranged in two sections, and a tender for either section will be considered, as well as tenders for the whole. Plans and specifications, with bills of quantities, prepared by W. Phelps, C.E., the company's engineer, may be inspected at the registered office of the company, Bailey Hill, Castle Cary, on any weekday between 10 and 5 (Saturdays between 10 and 1). Copies of the specification and quantities will be furnished on payment of £2 2s. Sealed tenders, marked "Tender for Water Works," must be delivered at the said office by 10 a.m. on Dec. 18.

Dec. 22. NEWPORT, I.W.—Supply and fixing complete of:—1. A 110 b.p. continuous working load suction gas engine and suction plant at the Waterworks, Carisbrooke, I.W. 2. A vertical three-throw double acting pump of Hayward Tyler's pattern, for the Corporation. Specifications and conditions of contract may be seen and forms of tender obtained on application at the office of T. R. Pratt, town clerk, Town Clerk's Office, 19, Quay Street, Newport, I.W. The pumping station may be inspected by appointment with the engineer. Sealed tenders endorsed "Tender for ——" must be delivered at the town clerk's office by Dec. 22.

IRON AND STEEL.

Dec. 7. LONDON, S.W.—Supply of about 1,652 tons of Bessemer acid steel main rails, weighing 88 lbs. per yard, and fish plates, for the Crown Agents for the Colonies, acting on behalf of the Government of Ceylon. Forms of tender and all particulars may be obtained on application at the office of the Crown Agents for the Colonies, Whitehall Gardens, S.W., between the hours of 10 a.m. and 4 p.m. (Saturdays 10 a.m. to 1 p.m.), on payment of a deposit of £1. Tenders to be delivered in sealed envelopes, addressed to the Crown Agents for the Colonies, Whitehall Gardens, S.W., not later than noon on Dec. 7, endorsed "Tender for Steel Rails and Fish Plates, Ceylon Government Railways."

Dec. 10. NANTYMOEL.—Supply and delivery of about 225 yds. of 12 in. cast iron flange pipes, to be delivered at Nantymoel G.W.R. Station, for the Ogmore and Garw U.D.C. Full particulars and form of tender may be obtained from H. D. Williams, engineer and surveyor. Sealed tenders, endorsed "Tenders for Cast Iron Pipes," to be sent to him not later than Dec. 10.

Dec. 14. MELBOURNE.—Supply and delivery at Williamstown Railway Pier, Melbourne, of the following rails and fishplates: 6,914 tons of 80 lb. steel rails, 620 tons steel fishplates for 80 lb. rails, and alternatively for 13,828 tons 80 lb. steel rails, and 1,240 tons steel fishplates for 80 lb. rails, for the Agent-General for Victoria, Australia. Specification and forms of tender may be obtained at the office of the Agent-General for Victoria, 142, Queen Victoria Street, London, E.C. Tenders must be delivered to him not later than 10 a.m. on Dec. 14.

Dec. 15. LONDON.—Supply of fire hydrants during the three years commencing Jan. 1. Tenders must be upon the official forms to be obtained from the clerk of the Council, County Hall, Spring Gardens, S.W. No tender will be received after 11 a.m. on Dec. 15. Full particulars and also information as to the conditions to be observed by tenderers will be found in the "London County Council Gazette" of Nov. 23.

No date. MANNINGTREE.—Supply and delivery to Manningtree Station, Great Eastern Railway, of about 880 tons of 12 in. cast iron water pipes, for the directors of the Tendring Hundred Waterworks Co. Copies of the specification may be obtained on application at the offices of the Company, Mistley, Manningtree, Essex.

PAINTING.

Dec. 5. MANCHESTER.—Painting the outside of 122 cottages, Miles Platting, for the Improvement and Buildings Committee. Specification may be obtained at the office of the city architect, Town Hall, Manchester, upon payment of £1 1s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Sealed tenders, enclosed in the official envelope, to be delivered at the above office not later than 9 a.m. on Dec. 5.

Dec. 11. SHEFFIELD.—Plumbers' and glaziers' work required for general repairs during the year ending Dec. 31, 1909, for the Education Committee. Specifications and forms of tender, together with cover, may be had on application at the office of the Education Committee, until Dec. 7. Sealed tenders, which will only be received on the form and in the cover provided, should be sent to G. S. Baxter, secretary, Education Office, Leopold Street, not later than Dec. 11.

Dec. 14. LEEDS.—Painting, etc., the interior and exterior of the Meanwood Road baths. Specification may be seen, and forms of tender and schedules of work obtained at the office of W. T. Lancashire, city engineer. Tenders, properly endorsed, must be received at the town clerk's office not later than 10 a.m. on Dec. 14.

PLUMBING & SANITARY

Dec. 7. DAGENHAM.—Construction, etc., of certain pipe sewers and other works on the sewerage system and sewerage disposal works of the parish of Dagenham, for the Romford R.D.C. Specification and drawings may be inspected at the office of W. Fairley, civil engineer, 69, Victoria Street, Westminster. A copy of the bill of quantities and form of tender may be obtained at the office of the engineer on producing receipt showing that a cheque for £2 2s., made payable to the Council, has been deposited with the clerk. Sealed tenders, on the forms required, must be received by W. Smith, clerk to the Council, 13, North Street, Romford, on or before Dec. 7. Securities required.

Dec. 7. SOUTHAMPTON.—Construction of a soil sewer for the sewerage of the Terrace House Estate, for the Corporation. Plans, specification, and conditions may be inspected and bills of quantities and form of tender obtained at the borough engineer's office upon production of the borough treasurer's receipt for a deposit of £1 1s. Sealed tenders, endorsed "Tender for Soil Sewer, Terrace House Estate," must be delivered at the town clerk's office, Municipal Offices, Southampton, before 2 p.m. on Dec. 8. Every tender must be accompanied by the borough treasurer's receipt for a deposit of £10 (Bank of England note). If a contractor should withdraw his tender after the same has been recommended for acceptance, his deposit will be forfeited.

Dec. 8. ITCHEN.—Constructing a storm water sewer in the Bridge and Vicarage Roads for the U.D.C., in accordance with the plans, specification, and conditions, which may be seen upon application to T. A. Collingwood, surveyor, Council Offices, Portsmouth Road, Woolston, Hants, from whom also bills of quantities and form of tender may be obtained on the deposit of £2 2s. Tenders endorsed "Tender for Storm Water Sewer," to be delivered at the office of W. H. Bell, clerk to the Council, Clerk's Office, Woolston, on or before Dec. 8.

Dec. 9. RIPLEY.—Construction of sewage disposal works at Northern Sewage Farm, comprising subsidence tanks, percolating filters, storm water filter, and other appurtenant works, for the U.D.C. Plans and specification may be seen and bill of quantities and form of tender obtained on application to H. Walker, consulting engineer, King Street, Nottingham, or to G. N. Bird, surveyor to the Council, Town Hall, Ripley, Derby. A deposit of £1 1s. will be required. Sealed tenders (upon the form to be supplied) must be delivered at the office of G. M. Capon, clerk, Public Offices, Ripley, Derby, not later than 12 noon on Dec. 9, endorsed "Tender for Sewage Works." No tender will be considered unless made upon the above-mentioned form. Fair wages clause.

Dec. 10. ST. ALBANS.—Supply of two gas engines (13 b.h.p.), suction plant, air compressors, receiver, shafting, and certain other alterations and additions to their present pumping plant situated at the Sewage Outfall Works, near Park Street (L. and N.W. Railway), St. Albans, for the Town Council. Further particulars, specifications and forms of tender may be obtained, and plans may be seen, at the offices of H. H. Humphreys, engineer, 28, Victoria Street, Westminster, on Dec. 2 and 3, only between the hours of 10 a.m. and 5 p.m. Intending contractors will be required to deposit a sum of £3 3s. prior to particulars being furnished. Tenders, endorsed "Contract 3 (Mechanical)," must reach A. H. Debenham, town clerk, St. Albans, not later than 4 p.m., Dec. 10.

Dec. 10. WALSALL.—Laying and jointing of about 1,092 yds. of 12 in. and 1,486 yds. of 9 in. stoneware pipe sewers, in deep tunnel and open cutting; the construction of manholes and lamp-holes, screening and distributing chambers, septic tank, and the laying out of irrigation area, including carriers, sludge lagoons, and other works, incidental thereto, for the R.D.C. Plans may be seen, and copies of the specifications, bills of quantities, and form of tender obtained, at the office of W. P. Young, surveyor and engineer to the council, District Council Offices, Rushall, Walsall, on payment of a deposit of £5. Sealed tenders, endorsed "Streetly Sewerage," to be delivered to me at the office above named, not later than 12 o'clock noon on Dec. 10. Securities if required.

Dec. 10. UCKFIELD.—Construction of sewerage and sewage disposal works for the village of Buxted, for the U.D.C. The works comprise about 1,700 yds. of stoneware pipe sewers, from 6in. to 8in., all necessary manholes, flushing arrangements, ventilation, etc., a small pumping plant, with about 250 yds. of 4in. rising main, sewage and storm-water disposal works, tanks, percolating filter, and irrigation works, etc., in accordance with plans and specification, which have been prepared by J. Taylor, the surveyor to the Council. The drawings and specification may be seen at the office of the surveyor, Henley House, Uckfield, from whom copies of the bills of quantities, schedules of prices and forms of tender may be obtained on payment of the sum of £2 2s. Sealed tenders, endorsed "Buxted Sewerage Works," must be delivered at the office of F. Holman, clerk, 86, High Street, Lewes, on or before noon, Dec. 10. Tenders will not be considered unless they are on the form above referred to, with the quantities and schedules properly filled in.

Dec. 12. MOLD.—Construction of new stoneware and iron pipe sewers, Dortmund tank, filter beds, and all appurtenant works at Mold, Flintshire. The plans may be seen and quantities and form of tender obtained at the office of W. H. Radford, engineer, Albion Chambers, King Street, Nottingham, on deposit of £2 2s. A copy of the plans may also be seen at the surveyor's office, Town Hall, Mold. Sealed and endorsed tenders must be sent in to R. S. Kelly, clerk to the Council, on or before Dec. 12.

Dec. 15. LONDON, W.—Construction of a sewer, mainly of cast-iron, lined with concrete and blue brick, of 7 ft. internal diameter, and of a total length of about 14,770 ft. to be formed in tunnel, together with weir chambers, manholes, side entrances, ventilators, etc., between Grosvenor Crescent and Warwick Road, Kensington, for the L.C.C. Persons desiring to submit tenders may obtain the drawings, specifications, bills of quantities, form of tender, and other particulars, on application to M. Fitzmaurice, C.M.G., chief engineer, County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of the sum of £10. Full particulars of the work may be obtained on application at the County Hall, before the payment of the fee for the specification, etc. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall in a sealed cover, addressed to G. L. Gomme, clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Low Level Sewer, No. 2, North Side, Contract No. 5." No tender received after 11 a.m. on Dec. 15 will be considered.

ROADS AND CARTAGE.

MANCHESTER. — Sewering, draining, paving, etc., passage behind the temperance billiard hall, and 78, Wilmslow Road, Rusholme, South Manchester; passage behind 38-48, Rushford Street, 2-40, Hatton Street, 1-37, Hopkins Street, and adjoining 2 and 38, Hatton Street, and 1 and 37, Hopkins Street, Newton Detached; passage behind 50-60, Rushford Street, 1-39, M'Farren Street, 8-42, Hopkins Street, 1-3, Newton Bank, and adjoining 1 and 39, M'Farren Street, 8-40, Hopkins Street, and 3, Newton Bank, Newton Detached; and passage behind 62-72, Rushford Street, 1-43,

Smart Street, 2-42, M'Farren Street, and adjoining 2 and 42, M'Farren Street, and 1 and 41, Smart Street, Newton Detached, North Manchester, for the Paving, Sewering and Highways Committee. Forms of tender may be obtained on application to the surveyor's office, Paving, etc., Department, and must be returned to the chief clerk, Paving, etc., Department, Town Hall, Manchester, not later than 10 a.m. on Dec. 4.

Dec. 5. HARBORNE.—Widening and reconstructing a portion of Ravenhurst Road, Harborne, for the Society of Harborne Tenants, Ltd. The drawings and specification may be seen at the Works Office of the Society in Moor Pool Avenue, Park Hill Road, Harborne. Tenders, sealed and endorsed "Ravenshurst Road," and addressed to the Chairman of Harborne Tenants, Limited, 106, Colmore Row, Birmingham, will be received not later than Dec. 5.

Dec. 5. BEXHILL.—Making up Collington Avenue with tar macadam (length about 1,100 ft.) and other works, for the Corporation. Plans may be seen, and bills of quantities, specification and form of tender obtained, upon application to G. Ball, borough surveyor, Town Hall, upon deposit of £20. The amount deposited will be forfeited if any tender accepted is withdrawn. Tenders, endorsed "Collington Avenue," must reach T. E. Rodgers, town clerk, Town Hall, Bexhill, not later than noon on Dec. 5.

Dec. 7. LONDON, E.C.—Paving carriageways as granite, syenite, basalt, or similar stone for road purposes during the year 1909, for the B.C. Particulars and form of tender may be obtained on application to the borough surveyor, Guildhall, Cambridge, to whom tenders should be sent so as to reach him not later than 9.30 a.m. on Dec. 7.

Dec. 7. LONDN, E.C.—Paving carriageways as undermentioned, for the Finsbury B.C.: King's Cross Road (part of), with 3 in. by 4½ in. by 8 in. creosoted deal blocks. King's Cross Road (part of), with 3 in. by 6 in. Aberdeen granite cubes. The specifications can be seen, and forms of tender obtained, at the borough surveyor's office, Finsbury Town Hall, Rosebery Avenue, E.C., any day except Saturday between 10 a.m. and 4 p.m., on deposit for each form of tender of £1 1s. Tenders must be delivered to G. W. Preston, town clerk, Finsbury Town Hall, E.C., not later than 4 p.m. on Dec. 7. Only those made upon the official form and properly filled in, will be entertained.

Dec. 7. LONDON, S.W.—Making up and paving of the following new streets, viz.:—A. That part of Franciscan Road, Tooting, which lies between No. 102, Franciscan Road (inclusive) and the North Eastern boundary of No. 148, Franciscan Road, described as "Franciscan Road (3)." B. That part of Franciscan Road, Tooting, which lies between the North-Eastern boundary of No. 148, Franciscan Road, and No. 168, Franciscan Road (inclusive), described as "Franciscan Road (4)." C. That part of Effort Street, Tooting, which lies between Recovery Street and Hoyle Road. The specifications and drawings may be seen, and forms of tender obtained at the borough engineer's office, New Streets Department, 56, East Hill, Wandsworth, S.W., between the hours of 9 and 4 (Saturdays 10 and 12). Tenders, enclosed in separate sealed envelopes, and endorsed "Tender for Paving ——," must be delivered at the Council house, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose, not later than 4 o'clock in the afternoon of Dec. 7. Securities if required. Fair wages clause.

Dec. 8. LONDON.—Roadwork and platelaying required for the electrification, on the underground conduit system of traction, of the existing tramways from Hackney Road via Mare Street and Lower and Upper Clapton Roads to Stamford Hill, for the L.C.C. Full particulars, and also information as to the conditions to be observed by tenderers, will be found in the "London County Council Gazette" of Nov. 30. Tenders must be upon the official forms to be obtained from M. Fitzmaurice, C.M.G., chief engineer of the Council, County Hall, Spring Gardens, S.W., upon payment by the cashier of the Council of the sum of £5 for the specification, etc. Full particulars of the work may be obtained on application at the County Hall before the payment of the fee. No tenders received after 11 a.m. on Dec. 8 will be considered.

Dec. 9. STROOD.—Supply of a high-grade 12-ton weight steam road-roller, with scarifier attached, and also a water-cart, for the R.D.C. Specification, with form of tender, may be had on application to L. Randerson, district surveyor, District Surveyor's Office, Meopham, near Gravesend. Tenders to be sent to J. E. Povey, clerk to the Council, Strood, Kent, not later than 4 p.m., Dec. 9, endorsed "Tender for Steam-Roller Plant."

Dec. 9. CARSHALTON.—Making up of Salisbury Road and Bernard Road, for the U.D.C., within their district, in accordance with the plans, sections, and specifications, which have been prepared by W. W. Gale, Assoc.M.Inst.C.E., Council's surveyor. Bills of quantities and all particulars may be obtained on application at the office of H. P. Lovelock, clerk, District Council Office, High Street, Carshalton, and on deposit of £1. Sealed tenders, accompanied by a priced-out bill of quantities, addressed to the chairman, and endorsed "Tender for Salisbury Road, and Bernard Road," to be delivered at the clerk's office, before noon on Dec. 9. Securities required.

Dec. 10. ENFIELD.—Making up the following private streets in the district for the U.D.C.:—Holtwhite Avenue, Enfield, Manor Road, Enfield. Plans and specifications can be seen, forms of tender and all information obtained, on application to R. Collins, Council's surveyor, at the Public Offices, any day except Saturday, between the hours of 9 a.m. and 5 p.m. Fair wages clause. Separate tenders for each road (on the forms supplied only) to be sent in to T. W. Scott, clerk to the Council, Public Offices, Enfield, Middlesex, not later than noon on Dec. 10, endorsed "Tender for ——." The tenders must be accompanied by a schedule of hours of labour, and of prices and wages to be paid for different classes of work, which schedule will be embodied in the contract.

Dec. 12. LEEDS.—Paving and flagging of the following streets:—Station Terrace, Station Mount, Station Place, Henley Road, East Park Parade, and Ivy Street, for the Highways Committee. Drawings may be seen at the city engineer's office, Municipal Buildings. Forms of tender and bills of quantities may be obtained, and copies of the documents forming the contract inspected, on application at the Highways Office, 155, Kirkstall Road. Sealed tenders, endorsed "Tender for Private Street Works," and addressed to the Highways Committee, must be delivered at the town clerk's office, Town Hall, Leeds, not later than 10 a.m. on Dec. 12.

Dec. 12. MAIDSTONE.—Supplying between April 1, 1909, and March 31, 1910, 65,000 tons (more or less) of broken road stones, such as:—1, Rhenish basalt; 2, Guernsey, Jersey, or Alderney granites; 3, Glee Hill basalt; 4, Leicestershire granite; 5, Penlee, St. Keverne, or other Cornish granites; 6, Penmaenmawr or other North Wales granites; 7, quartzite; 8, Norway granite; 9, quenast or lessines; 10, or other equally durable material. Also the following local materials:—3,000 yds. (more or less) of Sevenoaks rock, unbroken; 20,000 yds. (more or less) of surface-picked or grubbed flints; 2,000 yds. of Kent rag. Specifications and forms of tender can be obtained upon application to the county surveyor, Maidstone. Sealed tenders, endorsed "Tender for Road Metalling," must be sent to W. B. Prosser, clerk to the Council, Sessions House, Maidstone (upon the prescribed form) not later than 12 noon on December 12

Dec. 16. CHELMSFORD.—Widening of the carriage-way, relaying the wood paving and reconstructing of footpath in Duke Street between the Golden Lion and Threadneedle Street, for the B.C. Specification, bills of quantities, forms of tender and full particulars may be obtained, and the plan may be inspected at the borough surveyor's office, 16, London Road. Tenders (which must be on the form provided) enclosed in sealed envelopes and endorsed "Duke Street," must be delivered at the office of W. Smith, town clerk, Municipal Offices, 16, London Road, Chelmsford, not later than 4 o'clock on Dec. 16.

Dec. 31. TROWBRIDGE.—Steam rolling on 316 miles of main roads during the financial year ending March 31, 1910, for the Roads and Bridges Committee of the Wilts C.C. Specifications, schedules of approximate quantities and tender forms can be obtained on application to J. G. Powell, county surveyor, County Offices, Trowbridge. Sealed tenders, addressed to the clerk of the County Council, and endorsed "Tenders for Steam Rolling," must be delivered on or before Dec. 31.

Dec. 31. TROWBRIDGE.—Supply of road metal for the financial year ending March 31, 1910, for the Roads and Bridges Committee of the Wilts C.C. The materials required will consist of granites, basalts, flints, limestones, gravel, etc., particulars of which are set out in specifications. Schedules of approximate quantities and forms of tender to be obtained of J. G. Powell, county surveyor, County Surveyor's Office, Trowbridge. The bulk of the material will be required to be delivered at railway stations or wharves, except in the case of local material. Sealed tenders, to be addressed to the clerk of the County Council, County Offices, Trowbridge, must be delivered on or before Dec. 31. All tenders to be endorsed "Tenders for Road Metal."

No date. NEWCASTLE-ON-TYNE.—Supplying, breaking, and carting stone for the maintenance of main roads during the year ending March 31, 1910, for the Northumberland C.C. For forms of tender, condition and specification, apply to J. A. Bean, county surveyor, Moothall, Newcastle-on-Tyne.

MISCELLANEOUS.

Dec. 4. WORCESTER.—Supply and erection of about 500 yds. of unclimbable wrought-iron fencing by the side of the main road, near Bromsgrove Railway Station, for the Highways and Bridges Committee of the Wilts C.C. Full particulars and forms of tender will be forwarded on application to J. H. Garrett, county road surveyor, Shire Hall, Worcester. Sealed tenders, endorsed "Tender for Iron Fencing," must be delivered at his office on or before Dec. 4.

Dec. 7. SOUTH HETTON.—Supply of iron, castings, wire rope, oils, and other colliery stores, except timber, for the South Hetton Coal Co., Ltd. Forms of tender and specification, with full conditions, may be obtained from J. R. Lambert, South Hetton, near Sunderland, and applicants for forms must state the kind of stores for which they wish to tender. Tenders, addressed to the South Hetton Coal Co., Ltd., Sunderland, will be received up to Dec. 7.

Dec. 9. LONDON, E.—Supply of materials for fencing, and garden requisites. The guardians of the poor of the parish of Poplar Borough will, at their meeting to be held on Dec. 9, proceed to open tenders for supplies, as above, to the Farm Colony, Sumpney's Farm, Dunton, nr. Brentwood, Essex. Printed forms of tender, containing full particulars of requirements, which alone can be received, may be obtained by personal application at the office of G. H. Lough, clerk to the Guardians, Guardians' offices, 45, Upper North Street, Poplar, E., or on request will be forwarded by post. Sealed tenders must be delivered at the clerk's office, not later than 6.30 p.m. in the afternoon of Dec. 9.

Dec. 10. NOTTINGHAM.—Supply of (1) cement, (2) blue lias lime, (3) red bricks, (4) blue bricks, (5) timber, (6) earthenware pipes, etc., (7) earthenware pipes, etc. (patent joints), (8) iron castings, iron gullies, etc., (9) Yorkshire flags, kerb, etc., (10) granite setts, kerb and broken granite, (11) broken slag, chippings, etc., (12) broken gravel, (15) ironmongery, for the Works and Ways Committee, to commence Jan. 1 for one year. Forms of tender may be obtained by applying to A. Brown, M.Inst.C.E., city engineer, Nottingham, on payment of 5s. each. Patterns and samples may be inspected at the Eastcroft Depot, London Road, Nottingham. The committee will not consider any tender except those on the authorised form of tender, which must be sent to J. A. H. Green, town clerk, Guildhall, Nottingham, on or before Dec. 10. Fair wages clause.

Dec. 12. FARNHAM.—Execution of all or any of the following works at Hale Cemetery, near Farnham:—1.—Fencing additional ground. 2.—Setting out and forming paths and laying out additional ground. 3.—Repairs, painting, etc., to chapels and caretaker's lodge, entrance gates, fences, etc., for the Joint Burial Committee. Specifications can be seen at the office of A. J. Stedman, surveyor, South Street, Farnham, and quantities can be obtained from him upon the deposit of £1 1s. Tenders, which may be in respect of the whole of the work or any of the above portions thereof, to be sent to H. Potter and E. Crundwell, joint clerks, Farnham, on or before 9 a.m. on Dec. 12.

Dec. 19. LEEDS.—Supply of fireclay retorts, firebricks, lumps, and fireclay, for the gas committee. Specification and form of tender may be obtained on application to R. H. Townsley, general manager, Gas Offices, East Parade, Leeds. Tenders, endorsed "Fireclay Goods," addressed to the Town Clerk, Town Hall, Leeds, to be delivered not later than Dec. 19.

ARCHITECT'S Assistant (21), seeks re-engagement; Probationer R.I.B.A.; 5 years' church and domestic experience, in large Provincial office; good draughtsman and colourist. — Box 4726, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant, age 27, desires engagement, permanency preferred; good draughtsman, and capable at working drawings, details, perspectives, water-colour, and pen and ink, assistance with specifications, quantities and general work, levelling and survey; salary 30s.—Apply Aubrey Leonard Pritchard, Bryn Derwen, Rhyl, North Wales. 4709

ARCHITECTS', builders', estate agents', assistant, 19, working drawings, colouring, etc.; energetic draughtsman, assist in office work; good references from architect.—F., c/o C. J. Williams, 89, Shrubland Street, Leamington Spa. 4708

ARCHITECT'S Assistant (23), student R.I.B.A., 5½ years' experience, working drawings, details, levelling, surveying, drainage, specifications, knowledge of quantities; excellent references; salary moderate.—Bernard A. Dyer, St. Peter Street, Hereford. 4723

ARCHITECT'S Junior, 5 years' experience (23) desires immediate engagement; good references; neat draughtsman, colourist, etc.; assist quantities.—Apply Box 4727, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's junior assistant desires situation; 4 years' experience; good draughtsman, plot from sketches; certificates, building construction; also shorthand (100) and typewriting; good testimonials; energetic; would go on trial; age 19; salary £1. — Box 4674, BUILDERS' JOURNAL Office.

ARCHITECT renders assistance, competition, or contract drawings, quantities, surveys, etc.; own office or out. Terms low.—50, Elm Park Road, Finchley, N. 4731

ARCHITECT'S junior assistant (20), seeks permanent engagement, town or country; shorthand.—C. Weston, The Laurels, Rotherfield, Tunbridge Wells. 4734

ARCHITECT'S assistant (23), over 7 years' London and Provincial experience; excellent references; Inter.R.I.B.A. Exam. — H. J. Wilson, "Brinkdale," Park Road, Peterborough. 4670

ARCHITECT and Surveyor's Assistant (24); 8 years' London exp.; working drawings, specifications, superintendence, prizeman and medallist, testimonials; mod. sal.—W., 20, Holmewood Road, Streatham Hill, S.W. 4669

ARCHITECT'S, builder's, estate agent's assistant, 10 years' practical experience; good draughtsman; details; quick tracer; used to general routine, builder's office.—E. H. S., 13, Maidstone Road, New Southgate. 4729

ARCHITECT and Surveyor's junior assistant desires engagement; probationer R.I.B.A.; good draughtsman; 4½ yrs.' general exp; moderate salary.—F. G. C., 46, Franklin Road, Gillingham, Kent. 4641

ARCHITECT'S and Surveyor's Assistant, 15 years' good practical experience; excellent draughtsman, designer, and colourist; working drawings, details, specifications, surveying, levelling, and general routine; excellent references; moderate salary.—A. R., 1, Ivy Villas, Cheam, Surrey. 4698

ARCHITECT'S Junior Assistant, over 4 years' London experience, competition work, contract drawings, details, perspective; honours construction, Prelim. R.I.B.A.; very moderate salary.—Box 4661, BUILDERS' JOURNAL Office.

ARCHITECT'S son, 10 years' office experience, wishes to take up agency or post as representative in Lancashire, or North of England, to well-known firm in any special line of Building trade.—Apply Box 4585, BUILDERS' JOURNAL Office.

AS Clerk, cashier, depot manager, or any position of trust, 11 years' experience, builder's and coal merchant's trade; age 25; good penman; also reference; moderate salary.—Box 4659, BUILDERS' JOURNAL Office.

BUILDER'S or surveyor's assistant (20), 4 years with quantity surveyor; quantities, estimating, correspondence, plans, tracings, measuring up, levelling, etc.—H. Priddle, 4, Sumatra Road, West Hampstead, N.W. 4705

BUILDER'S general foreman, advertiser seeks engagement; 16 years' service as above with first-class London firm on important and various works; good references.—Address H., 150, Effra Road, Wimbledon, S.W. 4703.

BUILDER'S and Surveyor's Assistant (24), practical experience in construction and surveying; also quantities and levelling, supervision; assist estimating; draughtsman; well up in costs, accounts, wages, etc.; moderate salary.—Box 4684, BUILDERS' JOURNAL Office.

BUILDER'S Assistant desires situation; age 23; thorough office routine; can take charge; experienced in estimating; quantities; accounts; p.c. invoices; good draughtsman; moderate salary.—F. Webber, Cranfurd Rise, Maidenhead. 4701

BUILDER'S general foreman desires re-engagement; just finished large schools; town or country; thirty years' experience; thoroughly practical in all branches; good manager; steady and reliable. First-class testimonials.—W. R., 85, Grove Lane, Handsworth, Birmingham. 4702

BUILDER'S Assistant disengaged, 21 years' experience; office routine, plans, specifications, quantities, supervision, measuring up, levelling, and surveying; good references; abstainer.—L. J. Greaves, Prestwood, Great Missenden, Bucks. 4717

BUILDER'S Foreman, with good London experience of all trades, seeks position of trust; estate or business firm; correspondence invited.—H., 150, Effra Road, Wimbledon, S.W. 4716

CLERK of Works, just finishing large schools, wants situation, 15 years' experience; expert timber, good all trades; plans, surveying, levelling, etc., etc. Country estate preferred.—Caswell, New Council Schools, Biddulph, Staffs. 4720

CARPENTER and Joiner (age 32) wants job. Bench, fixing, alterations, or jobbing. Could take charge if required. Good references. Life abstainer.—Pearson, 53, Hartham Road, Isleworth, W. 4681

DOMESTIC Engineer, young, energetic, thoroughly practical, seeks sit as estimating or working foreman, used to taking charge; large heating and sanitary, installation; good refs.—Box 4707, BUILDERS' JOURNAL Office.

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, BUILDERS' JOURNAL Office.

ENGINEER, general, wants permanent appointment, official or private staff; thorough all-round experience; electrical, plumbing, smith, married, 34; good testimonials.—86, Bathurst Gardens, Willesden. 4704

FIREPROOF Engineers and Concrete Specialists. Advertiser, connected with above trades for 10 years, and whose name is well known in connection with same, desires position as manager, traveller, or head clerk; first-class book-keeper; aged 33; very moderate salary.—P. W. Potter, 73, Penshurst Road, Thornton Heath. 4719

GENERAL Foreman, 30 years' experience; man of ability; good references.—Foreman, 200, Francis Road, Leyton, N.E. 4685

GENERAL foreman, shortly disengaged, just completing large schools in North Stafford; abstainer; age 34; 12 years management of men.—Burchall, Crow Lane, Earlestown, Lancs. 4666

GENERAL foreman, disengaged, thoroughly practical and reliable; 20 years' experience; new or alterations; first-class reference.—F. C., 3, Crewdson Road, Brixton, S.W. 4668

GENERAL Foreman (or foreman of carpenters and joiners, either inside or out), seeks situation. Country or colonies preferred. Good references. Age 30. Life abstainer.—A. White, 51, Alexandra Avenue, Southall, W. 4730

IMPROVER, brass-finisher, etc., requires situation, 3 years' varied experience with well-known London firm; energetic, steady, and reliable; first-class testimonials. Abstainer. — Apply Box 4550, BUILDERS' JOURNAL Office.

JUNIOR Assistant desires situation, home abroad; good practical knowledge of constructi and details; competent draughtsman and colo ist, working drawings, measuring and supervisin surveying and levelling; moderate salary.—B 4613, BUILDERS' JOURNAL Office.

PLUMBER (26), abstainer, well up in all sanita or lead-laying; will do piecework; town or count Can do zinc and hot water.—W. E. B., Sch House, Muriel Street, Barnsbury, N. 4

PLUMBER (Reg. by Exam.), well up in hot wat and heating systems, capable of taking ent charge; 6 years' ref.; age 38.—H. P., 11, N Buildings, Hampstead, London. 4

PLUMBER (aged 30); gas and hot water fitte well up all branches, new or jobbing; wages m Town or country.—11, Glaskin Road, Hackney. 4

QUANTITY Surveyor, London, first-class expe ence, and qualifications, wishes to arrange w architects or others for preparation of bills quantities, adjustment of variations, etc.—B 4675, BUILDERS' JOURNAL Office.

QUANTITY Surveyors.—A builder wishes place his son (18) in above office; has had so experience. No premium, but can introduce bu ness.—Apply H., Ashford House, Wimbled Common. 4

REINFORCED concrete foreman, disengaged, lo and varied experience, especially in Kahn bars a expanded metal, timbering a speciality; carpen by trade; good refs.—G. C., 59, University R Tooting, London. 4

SLATE MERCHANTS AND BUILDERS' ME chants.—Experienced traveller (with 14 years' c nection Midlands), desires re-engagement; liberty middle of December; or could arran earlier.—Address, Slate, c/o Secretary, Builde Exchange, Sheffield. 4

SLATING and tiling wanted (labour only) day piece; any quantity, large or small; distance object.—Mack, Slater and Tiler, 3, Granville tages Tower Hamlets Street, Dover. 4

SHOP or General Foreman, long West-end ex rience, used to alterations and repairs; un stands stairs; used to good jobbing work. Addr A., c/o Mr. Seymour, 14, Allsop Place, Rege Park, N.W. 4

STONEWORK wanted (piecework).—Stone dre ings, Bath stone fronts to villas, etc.—Apply Powell, mason, 15, Elm Lodge Avenue, Readi 4

TO Builders.—Situation as improver wanted young man just out of his time; technical stude neat draughtsman; assist with quantities, su vision, etc.; abstainer. — Box 4662, BUILDI JOURNAL Office.

TO Estate Owners.—Builder (38), varied ex ence, desires position as agent or clerk of wo surveys, plans, quantities, setting out, acco and supervision; country preferred.—Box 4 BUILDERS' JOURNAL Office.

TRAVELLER.—Architect desires post as re sentative to good firm. — Address Box 4 BUILDERS' JOURNAL Office.

Appointments Vacant

AGENT, with slight knowledge structural e neering, wanted by well known firm to introc sale of speciality on commission, in Southam and district, gentleman having connection am architects, surveyors, and engineers preferre Write Reinforced Concrete, c/o Brown's A tising Office, 17, Tothill Street, Westminster.

CARPENTER and joiner wanted in provin good all-round and able to work saw bench, pla and moulding machine; gas engine; constanc suitable man; state wages, etc. — Box BUILDERS' JOURNAL Office.

WELL educated youth, to learn routine of a tect's office; some knowledge of shorthand typing desirable; commencing salary.—E. C and Co., 11, Bermondsey Square, S.E.

WANTED, immediately, a first-class active round architect's assistant, with considerable e rience in public, elementary, and secondary sc planning. He must also be an expedi draughtsman, capable of writing specifications checking accounts. Preference given to capable of preparing a complete bill of quan (London system), up to at least £10,000. S not to exceed three guineas per week, pa monthly. Apply stating full particulars and timonials (copies) to D. Pugh - Jones, C (School) Architect, 62, Charles Street, Ca

ıe Rise of Art in Rome.

The rise of Roman art—or, rather, its elevation to the level of a fine art, for the old city walls, the arcer Mamertinus, and the Cloaca axima, prove that Romans of remote mes could carry out constructive works pon a grand scale, whilst they had also quired the rudiments of the art of sculpıre—synchronises with the fall of Athens hich, previously sacked by Sylla, came, on the termination of the civil ar between Pompey and Cæsar, a Roman ovince. It is true that before the period nen Rome was thus included within the here of Greek influence and Greek cultre, the city had been, for many years st, constantly acquiring various works art, the result of conquests in countries ore highly civilised than her own. But ese trophies of national prowess were ized by the inhabitants of the city rather evidence of Roman valour than from y real appreciative feeling for the reed art which they embodied. Indeed, in e Roman view, the general study and ltivation of the fine arts could only tend weaken and render effeminate the aracter of the nation—now so long ured to a life of strenuous labour and nger; and as the national existence was pendent upon the continuance of its litary supremacy the development of istic taste was not encouraged by the vernment. The fine statues and other rks of art, obtained by conquest, were, wever, lavishly applied to decorate the blic buildings and streets of Rome, hough it was not until later times that, th the increased wealth and luxury of Romans, there came an ardent desire sumptuous edifices. The magnificent ult eventually achieved was not the outne of native genius. Much of the ndeur of ancient Rome was due to the te and skill of alien artists—chiefly eeks—who had sought an asylum in the y of the conquerors of the world. But is transplanted to a strange land, and ojected to new influences, customs, and vironments, Greek art lost many of its ional characteristics, and the monuntal works of Roman origin had little common with the best examples of se to be found in Hellenic towns. Few, eed, of the monuments of the eternal can be cited as evidence that their igners possessed that faculty of high iginative fancy (or poetical conception) ch was typical of Greek art at its ith. Despite many praiseworthy efforts de by contemporary Roman writers and ts, to direct public attention to the ner artistic triumphs of Athens, they do not appear to have been particularly successful in exciting the real interest of the nation at large. In fact, there is no doubt much of the monumental grandeur of Rome was due rather to the personal taste and liberality of successive emperors and private individuals (who were wont to patronise artists—not always for art's sake)—than to any acquired national instinct for aestheticism. Thus, although many temples, baths, aqueducts, amphitheatres, and other buildings, some of which are still in existence, bear witness to the unrivalled constructive and creative power of the Romans, yet there can be no doubt that all that was best in Roman art was either directly Greek or evolved from Greek prototypes. But, as the earlier Greek art had deteriorated since it left its native land, the ancient artistic memorials of Rome rarely contained more than a suggestion of those subtle refinements and poetical fancies which are the unique characteristics of the best monuments of the age of Pericles.

The Carmelites & Architecture.

Messieurs les Architectes, there is yet hope for you! The Carmelite fraternity have discovered you, and though it is not yet certain whether—being discovered—you are lost or found, yet the eyes of the Carmelites are upon you, and, just at present, upon your sins of omission and commission. So be well assured that through the medium of giant circulations your misdeeds and your merits shall be known to all the world, and in no wise shall you escape the penalties of such fame. For the "Daily Mail" critic finds but two buildings in all modern London possessed of beauty, and these, mark you, be alien buildings, by an alien hand. Thereafter, transferring his attention to modern Birmingham, he chastises it with whips and scorpions—yea, every bit of it, from its terra-cotta triflings to the badly-planned and factory-fashioned University. So now we know! Not that we would quarrel with Mr. Konody's conclusions about some of the Birmingham Bantlings, or about the very excellent work of M. Charles Mewès and his partner; but his panegyric on the Ritz Hotel and "The Morning Post" offices, and his inability to find good in aught else, raises in us a mood of philosophic doubt as to his qualifications for criticising English architecture. The storm thus raised, it was inevitable that the weakness of our present position should be given away by some stout protagonist of the Gothic Revival, to whom the style of Louis Seize would be as much anathema as any work of Inigo Jones or Christopher Wren. Yet, despite Mr. Weatherley, we take leave to assert that the Ritz is at least as truly indicative of its purpose as, say, the St. Pancras Hotel. What was not inevitable in such a controversy, and, therefore, all the more welcome, were the few sly digs by which Mr. Ernest Newton established the necessity for discrimination in the critics. Certainly, for a critic, Mr. Konody has an unfortunate penchant for labels. Mr. Belcher is doubtless searching for those Assyrian, Byzantine, and Egyptian elements that we learn are manifest in his latest works; and other worthy gentlemen will wonder how Flemish and Moorish motives have crept into buildings that they fondly hoped and believed were Renaissance of the real English brand. Nor do we quite know why the Netherlands gable should come in for such castigation, seeing that Inigo Jones, the father of the moderns, did not disdain its use for his Royal patrons abroad. Following this excellent lead of one branch of the Carmelite fraternity, the "Evening News" made a bold request in asking London architects to pillory the ugliest modern building in their city. Needless to say, very few had the temerity to do so, for ugliness is the cloak that covers a multitude of London buildings. One fearless individual, whose name is not familiar to us, found beauty in Whitehall Court, and ugliness in the British Medical Association Building; but there are dozens of others who would transpose the relative positions of these two. The hatred of the Goth for the Classicist will always appear in any architectural controversy; the fanaticism which brought the Gothic revival into being seems still to linger in its mouldering bones, and prevents a mutual understanding and appreciation.

R.I.B.A. as House of Lords.

In a breezy after-dinner speech the other evening, Mr. Paul Ogden, F.R.I.B.A., president of the Manchester Society of Architects, said that in some respects the R.I.B.A. was to the allied societies as the House of Lords was to the House of Commons. That looked like a very pretty compliment. But then Mr. Ogden went on to explain his comparison. The R.I.B.A., like the House of Lords, was something which, in the opinion of the other institutions, required revision, but resented interference with its aristocratic history. They all had, and always would have, a profound respect for their Institute, for it had undoubtedly done, and was doing, excel-

lent work in all that appertained to architecture, and to the education of an architect; but the latter work, as far as the training of young architects was concerned, would in the near future be carried out by the universities, and the Institute would be, or would have to be, content with the final examination qualifying for practice. Mr. Ogden's essay in prophecy was greeted with a chorus of "Hear, hears," and it may therefore be presumed that Manchester architects are with him in this matter; and it is, perhaps, not a far-fetched inference that they had all read with profit the articles in THE BUILDERS' JOURNAL on "The Architect of To-day." We would rather inspire prophecy than indulge in it; having, indeed, as much respect for the American proverb, "Never prophesy unless you know," as Mr. Odgen professes for the R.I.B.A. Mr. Edwin T. Hall, V.P.R.I.B.A., speaking to the same assembly, said that "the action of the Institute with regard to competitions was directed towards ensuring that all architects who took part in them should receive just and fair treatment." So mote it be; and, for our part, we are always glad not only to cheer them on in so excellent a work, but to render them all the help in it that lies in our power.

Standardising Trade Circulars.

Trade catalogues and circulars, in the aggregate, embody almost every item of practical information that the architect or the builder can desire to possess. But starvation in a land of plenty is not a rare incident, and few things are more exasperating than the knowledge that a particular item that one requires is so near and yet so far as yonder stack of catalogues, each of them compiled on an independent plan, some of them orderly and systematic, others exactly the reverse, some of them meagre in the extreme, others bewilderingly encyclopædic. In such conditions the search for data is apt to consume much precious time, and to ruffle the most equable of tempers. Clearly, some system of standardising the arrangement of catalogues would be an immense boon; and a general index to their contents would be a benefaction to business men. It would be an inestimable advantage to have at hand all the important trade catalogues bound into one volume, and furnished with a complete general index. The idea is by no means Utopian. It is not even novel. The booksellers long ago gave it practical effect. Perhaps the Architects' Technical Bureau is feeling its way towards a similar consummation. It is, at all events, taking an important step in the same direction. Standardisation of size and form is, of course, essential for catalogues that are to be bound together; and the Bureau is adopting a standard form of circular, and is providing folios in which the circulars can be filed and classified for ready reference. It should not be difficult to convince manufacturers and traders of the advantages of standardisation, since the chief object in view is that at which they all aim—to gratify the client, who would be only too glad to preserve circulars and catalogues that could be conveniently stored and comfortably handled, but who, as a rule, has a most decided objection to littering his office with pamphlets and leaflets that, being of almost every conceivable size and shape, defy the best efforts to keep them tidy, and are, therefore, as often as not, contemptuously cast into the waste-paper basket immediately on receipt. Hence both the trader and the would-be client suffer considerable loss; the former having to deplore the poor returns for his expenditure on printing, the latter the lack of information that he would have preserved if it had been put before him in a form rendering it convenient of storage. Those traders who have a firm belief in individuality of presentation may indulge it within reasonable bounds in the design and display of their advertisements in the trade Press, which, while allowing free scope for originality of appeal, furnishes also a rather apt example of the advantages of uniformity of size and shape. The trade journal is, at all events, easily filed and kept. If the Architects' Technical Bureau can do as much for catalogues and circulars it will economise the forces of all concerned. It will eliminate much worry and waste.

Problems of Unemployment.

A very careful systematic study of "Problems of Unemployment in the London Building Trade" has been made by Mr. Norman B. Dearle, Scholar of Brasenose College, Oxford, and Shaw Research Student of the London School of Economics, and the results of his investigations have been published in a volume that has just been issued at 3s. 6d. by Messrs. J. M. Dent and Company, of Aldine House, 29 and 30, Bedford Street, W.C. It is an extremely interesting book, but its practical value to any but students of economics and sociology is not very clear. The author, being an expert economist, does not fall into the popular error of saying, in effect, "Lo! here is the cause, and lo! there is the cure." That would be mere quackery. Instead, he makes use of every available source of information, carefully examines all the data, and proves nothing so clearly as that the causes of unemployment, being highly complex, do not admit of a simple remedy. His main concern is the ascertainment and statement of the problem, or rather series of problems, and he does but little more than indicate the directions in which the remedies may be sought. The various tendencies making for lack of or irregular employment are thus briefly summarised: Changes in the demand for labour that are irregular, but temporary, such as cyclical and other changes over a period of years; changes within the year, whether climatic and seasonal, or due to the consumer; while irregular but more permanent variations depend on changes of methods, processes, or materials, or migrations of trades or of particular processes, and on fluctuations of fashions and similar changes in demand. Then there is the failure to adjust the supply of labour to the demand for it. This results from leakage between one job and another, or between one firm or one district and another; or from the effects of changes among employers. A third group of causes are those that are inherent in human nature, such as physical and moral defects or other peculiarities in the individual; or, again, the collective defects of want of trade organisation, the immobility of labour, and the defectiveness of industrial training. The interaction of certain of these causes must also be reckoned with; and variation of locality gives them a fresh complexion, and necessitates special study. It will be seen, therefore, that the subject has many ramifications, and it must be admitted that Mr. Dearle has traced them not only with trained skill, but with admirable patience. One of the most interesting chapters in the book is that on "Long Period Variation," in which it is shown how cycles of prosperity and of depression interact, and how the intensity of the one is in proportion to that of the other. A "boom" usually coincides with a low bank-rate, cheap and plentiful money, and few opportunities for investment. The reverse conditions may cause depression, which is intensified by the locking up of much capital in municipal enterprises. Then it is found that "among the results of the recent boom has been an over-production of commodities—that is, of houses—and an over-supply of labour. Trade conditions caused everything to be built that could be built, especially the smaller work, the present shortage of which is one great cause of bad times." This is a comparatively simple view, and conveys no news to the builder; but the author, in his searchingly thorough survey of the situation, deals luminously with many matters that are far more recondite, his book being, indeed, crammed with eminently useful and very interesting data. No aspect of the subject seems to have escaped attention, and the student of industrial economics, as well as the architect and builder who take an intelligent interest in the phenomena of unemployment, will be glad to enjoy the fruits of Mr. Dearle's conscientious if necessarily inconclusive labour in a difficult field of inquiry.

The "Earthscraper."

What is to be "the most remarkable modern building in the world" will have, when complete, we read, "thirty-eight storeys scraping skywards and six storeys scraping earthward." This soaring and burrowing building will be situated at No. 50, Broadway, New York. It is to cost £775,000, and is to be faced with white enamel brick and terra-cotta. "There will not be enough wood in the building to make a toothpick." Hardware's your only wear. The new building code that comes into force next year in New York limits the height of skyscrapers, so that Mr. Hazlitt's example is sure to be extensively copied and developed. Unless some meddlesome code-maker steps in and limits the depth, these New Yorkers, in their new *vaulting* ambition, may get right through to their antipodes: when the enterprising American may be easily able to escape the—for him—desperate tedium of "coming out of the same door he went in at."

Our Special Issue.

As our Special Issue grows under our hands, its value becomes increasingly evident. The very numerous illustrations comprise first-class half-tone engravings of some of the most beautiful and most interesting buildings in the kingdom. The issue, which will be ready on December 30th, will be in reality a volume of considerable bulk; as, besides the abundance of historically and architecturally interesting pictures, there will be a large amount of reading matter, introducing many features of special interest. Regular readers are again urged to place their orders without delay, so as to prevent disappointment, as there is every indication that the demand will greatly exceed the supply, as it did very considerably in the case of last year's Special Issue, copies of which were soon at a premium.

PUBLIC BUILDINGS IN ENGLAND AND FRANCE.*

An Appreciation of French Buildings.

By A. R. Jemmett, F.R.I.B.A.

I assume the superiority of French public buildings, and I state this quite simply as a fact needing no demonstration and admitting of no discussion. The only thing left to discuss is the reason why it is so.

Racial Distinctions.

Certain racial distinctions of character and temperament have produced the result we see. I would take as the first example the stubborn individuality which seems to me to be a dominant racial characteristic of the Englishman. I do not wish to belittle this excellent quality; but every quality has its defects, and the defects of this one have produced results which it were well to examine. It has produced a passionate love for individual liberty of thought and action, and for the development and the free expression of individual character which has profoundly affected our political, social, and artistic development. It is no doubt one of those qualities which, as they say, have made us what we are; but it is precisely what we are that I am about to deplore.

The Englishman's Individualism.

Individualism tends to exalt the individual at the expense of the State; carried to extremes, it destroys the state and spells anarchy. It tends to make a man self-centred and selfassertive, unsympathetic and narrow; to confine his enthusiasm in life to himself and his own achievements, his own home, and his own business interests. Such a man approaches all public questions from his own personal standpoint. If he sees no personal profit, he will make no personal sacrifice. This attitude affects his buildings. He will spend money with pleasure on his own house, with satisfaction on his own business premises, but grudgingly and of necessity only on a public building, which he regards in the light of a painful public necessity or even that of a public nuisance. Naturally, therefore, we find the artistic energy of the country expended on private, not public, buildings.

The Subjective Architect.

This same characteristic in our architects gives to them, too, the personal point of view, and drives them on, unconsciously, perhaps, to express themselves, not the nature of the buildings; to seek inspiration from the depths of their own inner consciousness, and not from a sympathetic insight into the ideas and feelings of the communal life, and the special characteristics of that special section of the community whose life they are supposed to interpret and express. Our public buildings tend, therefore, to be only the expression of their authors' personality, influenced more or less by such necessities of the case as cannot be ignored, though greatly resented, and by such considerations as are firmly forced upon them.

The Communal Frenchman.

Now, with the Frenchman it is different. He is not so stubbornly individualistic; his social instincts are more strongly developed. With him the communal life tends to develop at the expense of the individual. He has an enthusiasm for the corporate life of the nation; his country is to him a poetic abstraction, a sacred ideal. The artistic energy of the country is expended less on private than on public buildings, which fitly express the dignity of the national life, and neither time nor pains nor money is spared. The Englishman may give grudgingly and of necessity, but in this the Frenchman is a cheerful giver. Their architects, less self-centred or self-assertive than ours, approach their work in a different spirit; they take the impersonal attitude and endeavour to express the building, not themselves. Their more sympathetic outlook enables them to enter more fully into the communal ideas which the buildings typify, and these buildings tend to be a more adequate expression of these ideas. The personality of the author is apparent only as a subtle flavour in the dish, but it is never aggressive, not the dominant flavour: that is given by the personality of the buildings. With us the personality of the author is the all-pervading flavour, while that of the building is difficult to taste.

When we in England come across a new public building by one of our well-known masters, we exclaim: "Ah! one of Blank's buildings; I wonder what it is." In France they say: "Ah! a town hall; I wonder who designed it."

Love of Open-air Life Affects Buildings.

Another point to which I will just briefly refer is the Englishman's greater love of the open air and of country life. Owing in part to this and in part to our insular position, our country life was made more secure and was, therefore, more fully developed at an earlier date than in France. This has tended to enhance the relative importance of the French towns and their public buildings. But although this is most interesting from an historic standpoint, I would prefer to pass on to a point which is to me the most interesting of all, and one to which reference is not so often made.

It begins with a question of temperament. We are told that the average Englishman is a reserved, shy, self-conscious person who hates what he calls making an exhibition of himself or his feelings, and that the one thing in this world that he really fears is the idea of making himself ridiculous; that he dislikes ceremonies and public functions of all descriptions, at which he always feels self-conscious and ill at ease.

The National Self-consciousness.

Now whether it is really the natural expression of our temperament under modern conditions, or the effect of the outbreak of Puritanism in the seventeenth century, when the beauty of life was denied and the natural instincts of the heart were considered vile, and their expression in all forms and ceremonies was condemned as ridiculous, childish, or worse (a corrosive acid that would bite deep into a temperament predisposed to self-consciousness), or whether again it is the result of the predominant position in our public life of the serious and sober-minded Scot—whichever it may be, the fact remains that since Puritan times we seem to be losing all interest in what might be called the decorative side of communal life—the pageantry, the ceremony of life—the poetic aspect of human relationship in public affairs.

A certain amount of ceremony in the relations of man to man is, of course, necessary to the mere existence of even the lowest form of civilisation; in fact, ceremony is civilisation: that we seem to admit; but we have reduced it to minimum, reserved it for exceptional occasions, and starved our civilisation accordingly.

It is not my object, however, to point out how this neglect of the poetic interpretation of life in the daily conduct of our public affairs lessens the value of life to us all, but rather observe its effect on our public buildings.

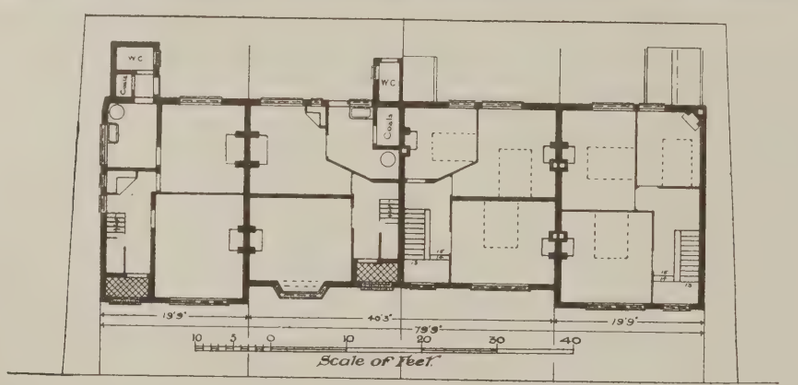
The Poetry of Public Affairs.

It is evident that if you desire no ceremony in the conduct of public business you desire no ceremonious arrangements and lay-out in the buildings in which this business is conducted. It is useless to create spacious entrances, staircases, and halls, in which public functions can be performed with a stately dignity and a symbolic decorative grouping typifying their importance, if all those who have to take part in the function feel miserably self-conscious and unhappy, and shuffle through it awkwardly, with the sole idea of getting done with it as quickly as possible—any sort of shed is good enough for that. If a judge of the high court is intent to arrive surreptitiously at a back door, slink up a back stair, and creep into court through a hole in the panelling behind his seat, and if we feel that his procedure is in accord with the dignity of the duties he performs and the sublime idea of divine justice which he typifies, of course we do not want him to be received with stately ceremony and conducted in solemn procession through a grand processional avenue to the seat of judgment. The practical Englishman may say that he gets there in the end, and that the criminal gets hanged all the same, and that that is the essential thing. It may be the essential, but it's not the only thing. If it were so, why not adopt the procedure of some of the backwood despots in America, where the judge lounges in his shirt sleeves and smokes a big cigar behind an upturned packing case in the back yard of the local saloon? There the criminal gets hanged all the same, generally on the nearest tree, while the court adjourns for drinks, and the procedure is altogether as effective and in every way more practical, expeditious and economical than ours, but they do it without ceremony, and they get no building.

Decency and Order.

The general sense of civilised humanity, however, demands that such proceedings shall take place with at least some decency and order; so decent and orderly procedure in our courts produces decent and orderly buildings. But there is something more even than decency and order, and that is the point I want to make.

If we regard the administration of justice from the practical point of view alone, the mere extermination of criminals for the public convenience—an affair as disgusting and prosaic as the extermination of vermin—the procedure in our courts and the attitude of mind and behaviour of those engaged in them tends to become prosaic also, and decency and order in your building may be sufficient to express adequately the function, and to satisfy your ideas. A sessions house or assize court may be the fitting name for it. But if you regard justice as something more than this: if you see in it a sbulime moral idea worshipped in greater or less degree by the whole of mankind, something that appeals most powerfully to the spiritual side of your nature, the whole tone and temper of the procedure in your courts are changed; the attitude and actions of all those engaged in it, influenced by the gravity of their duties and their sense of the immanence of the spirit of Justice, take on a different aspect; the spontaneous expression of their natural feelings tends to a more expressive symbolism of grouping and arrangement, a more characteristic and stately ceremonial, which in its turn modifies the general conception of the plan, the relative sizes and position of entrances, corridors, and halls, and moulds the form of the building to permit that ceremony to be properly performed, and to be aptly and truthfully expressed in the whole structure. You have now a building which has been influenced in arrangement and general lay-out by an abstract idea; you have taken all practical and material considerations, and lifted them up into the realm of the spiritual; you have arrived at a poetic conception: Justice enthroned—you express it in a moment—a Palace of Judgment.



The Frankness of the French.

This is, to my mind, the one great distinction between French and English public buildings—French buildings are monuments, ours are not; they express abstract ideas, ours do not.

I would not infer from this that the

*Paper by A. R. Jemmett, F.R.I.B.A., read at the Architectural Association Debating Section on Friday, November 27th, 1908.

GROUP OF FOUR COTTAGES ERECTED AT MERRY HILL MOUNT, BUSHEY, HERTS.
G. M. McCORQUODALE, ARCHITECT.

The material used is brick, rough cast. The roof is covered with red sand-faced tiles with half-round ridges and hips. Part of the partition walls are half-brick in cement, and part plaster slabs. The windows are wood casements, glazed with leaded glass. The hill slopes steeply, and the floors are at different levels. The two centre cottages have floors at the same level, while one end has floors 18-in. higher and the other end 18-in. lower than centre two. The builder was Mr. F. P. Bliss, Bushey.

French feel more deeply than we do, though they probably see the poetic side of more aspects of life, but only that they are not ashamed to show their feelings and express them by acts and ceremonies. If we were not ashamed to show ours, what a monument we might raise to Justice; for so sincere is our worship of this idea that a temple rather than a palace might more fitly express our feelings; but so pitiful is our self-consciousness, so abject our fear of ridicule, that our feelings never find expression in any spontaneous acts or ceremonies that would supply the architect with the necessary *motif*.

While we, as a nation, continue to make a boast of the suppression of our feelings, and pride ourselves on preserving in each and every circumstance of life, and in every public act we are called upon to perform, the same calm, unruffled attitude of dignified reserve and aloofness, or (as I might put it for my purpose) the same blank expressionless aspect of wooden jointed automata, we may do great things, but not in architecture; we may build empires, but not monuments; a sessions house, perhaps, but not a palace of justice.

Palaces of Justice.

As an example of a palace of justice I would cite that at Brussels, and ask you to compare it with any law court in England. This building is not French, perhaps, in the technical sense, but it is French in spirit and inception, and was designed by a man who had been trained in France, and its fundamental qualities are to be found in greater or less degree in all French palaces of justice. I instance it because it is the best known example, because it most forcibly illustrates the point, and, I suppose, because I have recently seen it and retain a vivid impression of its effect. I am not asking you to consider its immense size or cost, or even the artistic qualities of its features or detail, but to note the general conception and lay-out, the relative positions of the courts grouped in accordance with their relative importance and the approaches to the same. If this building were a mere brick shell without features or detail, it would still be a monument, and would express in its general arrangement and the resultant grouping and outline the idea of justice, although robbed of much of its proper impressive effect. Now here again our unfortunate temperament comes in from another point of view. This building is really most impressive—to the impressionable. The cumulative effect on the imagination, as one mounts the broad flight of steps to the immense central entrance, flanked by open-air colonnades and staircases on either hand, and passes through the great central hall, and so directly on, slightly rising as one goes, finally to find oneself face to face with the judgment seat of the supreme court of assize, is really tremendous. One enters the court with the mind attuned; one feels it must be really quite difficult for an impressionable witness to perjure himself in that court. But when you are dealing with a people so stubbornly individualistic and self-centred as to regard impressibility as a weakness, what can you do? What is the good of creating impressive effects for people who will not be impressed, who refuse, on principle, to be impressed?

Sessions House!

I have purposely contrasted these titles, a sessions house or a law court, with a palace of justice, as the very names express the different point of view; and I would add by way of further contrast a picture gallery and a palace of art—Covent Garden Opera House and the National Academy of Music (Paris Opera House), municipal offices and Hotel de Ville; and this last title brings me to my last illustration. I would like to relate an incident which seems to me to illustrate most aptly French ideas of the value of ceremony, and how they may affect the lay-out of a building to express an idea.

The Hotel de Ville.

It concerns the Hotel de Ville at Paris. This, as its name implies, is the house or the home of the city, and as such it is laid out with a due regard to the dispensing of the city's hospitality and the proper reception of its guests. Although accommodation for this purpose is most lavish and magnificent, and its arrangement, therefore, modifies the general conception to some extent, yet this idea of hospitality does not entirely dominate the general lay-out of the building; it is only allowed to assert its relative importance.

For many years after its re-erection this building was considered to be entirely adequate for the reception of the most exalted guests; but now comes an unusual circumstance.

After a period of national isolation and depression, France concludes a treaty with Russia which relieves her of anxiety and reaffirms her position among the nations. To crown the event, the Czar comes to Paris and is to be received at the Hotel de Ville. The occasion is altogether of exceptional national importance: enthusiasm is at fever heat, and Paris rises to the occasion.

Now the interesting point is that it was not so much the size or the decoration of the reception rooms of the Hotel de Ville which were felt to be inadequate, as their arrangement and the method by which they are approached; not so much the spaciousness of the entrances and stairs (which are quite in proportion to the magnificence of the reception rooms) as their arrangement their position in the peneral lay-out of the whole building. They are arranged more for the reception of a great number of persons than for one august personage. It was not in acordance with the sentiment of the occasion that the Czar should enter anywhere but by the main entrance front to the Place de l'Hotel de Ville, or that he should use either of the two archways on this front (why one more than the other?), and cross a court diagonally, to be set down under the archway and one end of the Salle St Jean, from which he would have to take too many turns and destroy the dignity of his progress to the centre of the reception rooms on the first floor. It was felt that the Place de l'Hotel de Ville was naturally the place for a grand spectacular climax to the outdoor procession—the culminating point in the whole ceremony to the man in the street—and that the Czar must be taken direct from this square by a straight processional way to the centre of the Salle des Fetes on the first floor on the opposite side of the building. This was effected by making the Salle des Prévots the entrance hall, roofing in the central court and building a staircase to land in the central committee room on the first floor (which was redecorated as a reception room), and so through the hall of the caryatides to the centre of the Salle des Fetes.

We have now a principal reception entrance to the whole building—for the use of the guest of the evening—while the two permanent entrances become secondary ones for the use of the company assembling to receive him, and we get a building whose general lay-out is entirely dominated by the arrangements for reception, by the idea of civic hospitality.

The Guildhall.

Contrast with this the reception arrangements at our own Guildhall, where for centuries we have made a speciality of the reception of foreign potentates and the most famous of our citizens, and have made this so prominent a feature of our civic life that the fame of it has spread abroad to all lands, and the Guildhall stands as the symbol of civic, or even national, hospitality. How do we find this expressed in the building? It is not expressed at all. We cannot consider the arrangements, for there are none. But what does it matter? By using a library as a reception room, a Guildhall as a banqueting room, and a picture gallery as a retiring room, we are able to offer just as good a dinner—the lack of arrangement does not affect the cooking, and the guest is not supposed to mind how he arrives to his seat so long as he finds a good dinner when he gets there. But it is curious that during all the years in which alterations and additions have been made from time to time to council chamber and offices, that no attempt has been made to bring the reception arrangements more in accord with the national sentiment.

If you compare the importance, in the popular imagination, of the civic hospitality with the relative insignificance of its administrative functions, you would expect to find a building entirely dominated by this idea of hospitality and with a permanent Sovereign's entrance such as was created in Paris for a special emergency.

Now I don't suppose for one moment that if we had such a magnificent building as the Hotel de Ville in which to receive a specially honoured guest, such an idea as I have described would ever have occurred to us; or if it had occurred to some official accustomed to ceremonies, that the public would have approved such expense in structural alterations for one night only and for a mere sentiment. It is not our way of looking at things. I do not mean that we would grudge expense on such an occasion, but we should have spent the money another way—flowers, gold-hangings, and tapestries, or something especially nice for dinner; but, if I understand the French point of view aright, they would have brought their guest in a direct line from a central entrance if they could only have afforded a rough deal stair with a strip of red baize down the centre. It is the arrangement of the ceremony, the method of receiving him, that does honour to the guest, not the costliness of the surrounding. It is the arrangement of a building that expresses their sentiments, not merely its features and details.

An Instinct for Ceremonial Grouping.

It seems to me that it is this instinctive sense of the need of ceremony, of spontaneous grouping and arrangement, that supplies the *motif* for the more gracious and artistic lay-out of their plans. The plan alone rightly handled, has feeling and expression, and this brings us to the technical aspect of our subject, in which the proper imaginative handling of the *motif* is everything. Here they have the advantage of us. They have been taught how to take any *motif*, and from it build up a monument that expresses or elaborates the *motif* by the logical application of a systematic method of architectural expression, which is the outcome of a respect for the principles of architecture.

It seems to me that until we study these principles and upon them build up for ourselves a method of expression suited to our national character, that we are not in a position to make a true comparison possible. We are groping about without method or system to find a language of expression; they possess one in which they are writing poems. So the matter would seem to stand thus: not only has the Frenchman a finer *motif* to work from, but he also knows far better how to develop it.

The Philosophy of the Matter.

Taking into consideration, then, these various aspects of the case, I am reluctantly forced to the conclusion that the whole philosophy of the matter might be summed up in our well-known proverb: "You cannot make a silk purse out of a sow's ear." If you want gracious and stately and beautiful public buildings, you must lead a gracious and stately and beautiful public life; but if from peculiarities of character and temperament such life is impossible, then so are the buildings. If we, as architects, from the same reasons, are not content to work freely within the limits of a principle, and cannot rise to the conception of architecture as an impersonal art, and adopt the impersonal attitude in which all great monuments have been created, we shall never create monuments except to our own limitations.

NEWPORT'S PROPOSED NEW TECHNICAL INSTITUTE.

The site of the new Technical Institute, Newport, Mon., for which tenders were recently called in, is situated at the corner of Clarence Place and Rodney Road, and has three important street frontages. The exterior of the building is in a severe modern classic style. The principal entrance will be approached through a portico built in Cornish granite, with massive Doric columns. The building will have a granite plinth, capped by a granite sill course round the main street frontages. The art rooms, on the second floor, lit by large windows in a Mansard roof, will have embossed copper panels between the necessary large plate-glass windows. Above the main entrance there will be a large reinforced concrete dome, 26ft. in diameter, covered with copper. The walls of the building will be built with local stock bricks, with external facings of pressed brick.

The entrance hall will be octagonal in shape, and the main corridors leading from three sides of the octagon will give immediate access on the ground floor to the pupil teachers' centre, engineering workshops, and class-rooms. The main staircase will be so arranged as to give easy access to the various floors and departments. Near the main staircase are the cloak-rooms.

The building will be constructed of fire-resisting materials throughout. On account of the nature of the site, the building is placed on a concrete raft reinforced with expanded steel. The raft is so arranged that, as far as possible, hard clay will be the subsoil. The walls throughout will be constructed of good hard, sound local stock bricks. The floors will be constructed of coke-breeze concrete and rolled steel joists.

The cubic content of the building is 1,121,414 cubic feet, measured from the bottom of the footings to half-way up the roof. The architect's estimate for the building, as approved by the Board of Education and Local Government Board, was £36,500. The Council have now accepted a tender for £36,130, and it is anticipated that the whole of the buildings will be erected within the original estimate.

The building has been designed by Mr. Charles F. Ward, A.R.I.B.A., borough architect, and the building contractor is Mr. W. E. Blake, of Plymouth.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Dec. 14	BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos, Town Clerk, Town Hall, Blackpool. Deposit £1 1s
Dec. 19	WHITTINGHAM. ANNEXE TO ASYLUM FOR PAUPER LUNATICS, for the Lancashire Asylums Board. Limited to Architects who are in practice and are ratepayers in the County of Lancashire. The new building is to accommodate 700 inmates. Premiums of £100, £50, and £25. Particulars and plan of site from Leonard Colman, Law Clerk to Committee of Visitors, 8, Lune Street, Preston. Deposit £5 5s.
Dec. 31	*CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50. £20 and £10. Premium for successful design to merge in Commission. Particulars from C, L. Cowlard, Clerk to County Council, Bodmin. Deposit, £1 1s.,
No date.	SWINTON. New Schools in Cromwell Road for the Swinton and Pendlebury U.D.C. Limited to Architects having offices within ten miles of Manchester. Premiums of £50, £25, and £10. Instructions may be obtained by letter on or before November 5th, to W.T. Postlethwaite, Council Offices, Swinton, Manchester.

* *This competition has been unfavourably reported upon by Correspondents.*

Brighouse New Secondary School.

Two days after the announcement of the result of the competition for this building, reported in our issue of November 25th, we received a letter from one of the competitors complaining of the almost indecent haste with which the drawings submitted were assessed. Fifteen sets were received, each comprising eight double-elephant sheets, and our correspondent very rightly observes that it is hardly to be believed that the merits of the respective designers could be fully appreciated in two or three hours. We learn from the report of the Education Committee meeting in the Brighouse "Echo" the same idea occurred to one of the Councillors; but the assessors stated that the same decision would have been reached even if they had taken more time. Acting on this complaint, we sent our Special Northern Commissioner to examine the drawings, and we have received from him a serious report, not dealing, however, with the assessment of the designs, but disclosing in connection with this competition certain matters which seem to us to call for careful investigation by the proper authority. We have accordingly handed our Commissioner's statement and the papers forwarded by our correspondent to the R.I.B.A. Competitions Committee for consideration.

Cardiff: Glamorgan County Hall.

The result of this competition, assessed by Mr. W. D. Caröe, was received by us on Friday last. The design placed first is that of Messrs. Harris and Moodie; that placed second is by Messrs. Pearson and Milborne, and the design placed third is by Mr. Henry T. Hare, of London. We are informed that 198 sets of designs were received.

Poster for Building Exhibition, 1909.

In this competition, promoted by Mr. H. Greville Montgomery, M.P., about 200 designs have been received. The assessors are Sir Aston Webb, R.A., Sir George Frampton, R.A., and Mr. Ernest George, Pres. R.I.B.A. We are informed that yesterday (Tuesday, December 8th) was

the day appointed for judging, though, when the information was given, it was not certain that all the assessors could attend on that day. If the designs were not assessed then it is probable that the result will not be known before Christmas.

Bakewell Baths.

The accepted plans for the proposed new baths and pump-room are those submitted by Messrs. Boyden and Walton, of Buxton. At a meeting of the Urban District Council at which this announcement was made, it was stated that applications had been received from several newspapers for loan of the plans for reproduction. Several councillors objected to the plans being lent pending further consideration, but the representative of a Sheffield newspaper informed the chairman that he had already photographed them. The objection to publication is not easy to understand.

EARLY STUDIES & FUTURE PRACTICE.*

By William Dunn, F.R.I.B.A.

Studying Old Buildings.

I do not think I need urge you to study old buildings; the young architect takes to that as naturally as a duck to water. But in your study do not waste too much time in making sketches and views. Rather measure and plot in the field what you measure; by that means you come to learn scale, one of the chief, as it is one of the most subtle, factors in our success. You will learn the relation between the scale drawing, by which we must express ourselves, and the actual building.

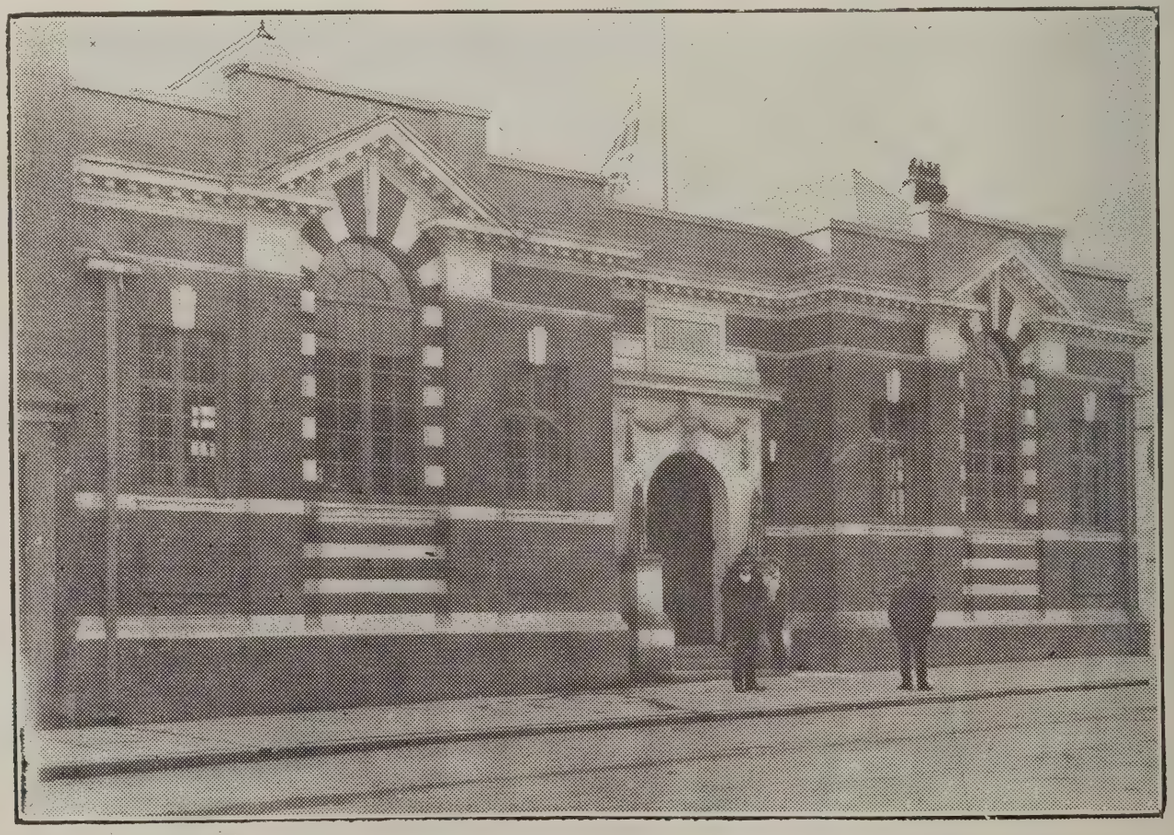
*Abstract of a paper read to the Architectural Association on December 4th.

Need for Width of Knowledge.

Our profession is so wide-reaching and so multifarious in its ramifications that there are few branches of useful knowledge which you won't find use for. But whether you study water-colour drawing or drainage, modelling or mathematics, surveying or sanitation, or even read law cases, or become acquainted with machinery or gardening, your future work will find use for such learning.

Making Sections.

I would have you never take your section through that part of the building which shows least, but through the part which shows most; make sections and elevations of every part upon which there is the least uncertainty; leave nothing to be settled by the builder, and if you do not know how to construct this or that part, find out from your seniors or from the builder or the clerk of works, or the foreman, or your books, how it should be done, and show it on the drawing. You may at first err by putting in unnecessary detail, and make mistakes which will give you trouble, because you have not judged rightly, but these errors will correct themselves.



Theory and Practice.

I am amazed by the opinion of the Board of Architectural Education, which I find in the Institute Kalendar, that while the rudiments of mathematics and applied science should be taught to architectural students, no more than is necessary should be given. But what differentiates our practical knowledge from that of the contractor, if it is not in the application of theory? However much we may advocate the learning of a craft, or actual handiwork at the bench or on the bank, we cannot hope to have that intimate knowledge of the actual processes which the workman's years of training have given him. We cannot equal a good house painter in the understanding of the workmanlike quality of his work; we cannot rival the bricklayer or the mason in a knowledge of what constitutes good mortar, save by the application of that science of which we are told we require but the rudiments. I say emphatically that we require much more than the rudiments if we are to be really architects. The builder has an accumulated store of experience to tell him whether this construction is safe or that is unsafe; but with a good knowledge of mathematics and applied science the architect can transcend experience in a large degree, and proceed to combinations beyond experience with confidence and safety.

I have no scruples in asking advice from builder, foreman, or clerk of works as to practical processes; these men must know more than I do in their own lines. But I must be capable of dealing with the larger problems of design and construction.

Practical Knowledge.

When you have arrived at the stage of starting practice, you will find that practical knowledge seems much more important to your happiness and welfare than all your artistic powers. Your powers of design are certainly important, as enabling you to scheme out your plans for varying requirements and in cultivating that invention for which there is con-

NORTH BRANCH CARNEGIE LIBRARY, BIRKENHEAD. A. W. STREET, ARCHITECT. *Liverpool Post.*

This Library, recently erected at the corner of Price Street and Pensby Street, is faced with Ruabon bricks, and Storeton stone dressings. The squ entrance hall has a panelled ceiling and a centre glass dome; the newspaper and reference rooms on either side are well-lighted, and the distribution counter, which is immediately opposite the main entrance, has the usual provision for book indicators. The vestibule and hall floors are laid with Italian marble; the woodwork is of mahogany, oak, and pitch-pine; and the floors of the inside rooms are of wood blocks. The contractors were Messrs. Hall & Sons, Liverpool.

stant scope in your work. One may grieve to see the blatant and vulgar work of successful men, and wonder how the world can confer the title of architect on them, but you will find it withheld from you unless you study drains and hot water and how to make a house dry. I believe that a thorough knowledge of the principles and practice of sanitary science could be acquired by any smart junior who could draw, in about three months' study, in making drawings of drainage schemes and plumbing details. There is nothing very abstruse or difficult in the subject until we come to the higher branches, such as sewage disposal on a great scale, and a knowledge sufficient for the smaller problems is simply invaluable to us.

Hot Water Work.

With hot-water supply and hot-water heating it is the same, and I suggest to those who have not yet done so that they should take a set of plans for a moderate-sized house, say, and make drawings to one-eighth scale, showing the position of the boiler and the runs of pipes for both supply and heating, adding to it sketches of the boiler and main connections, then submit such drawings to any hot-water engineer of your acquaintance, and discuss the proposals in detail. You will, in a few such lessons, learn enough about it to enable you to form an opinion on, perhaps enable you to discover defects in, the schemes submitted to you.

The Constructive Instinct.

All manner of construction should be the object of your attention. The right use of the material is essential to every artist, but I do not limit this to debating on the proper design of plaster mouldings or the difference in the planning of ornament in cast metal or in wrought. I say that in your beams and your roof trusses there is a right and there is a wrong use of the material, which takes a great deal of thinking to discover. A great mind like Wren's or like Da Vinci's or like Brunelleschi's has a fine constructive instinct, but in every case this must be sedulously cultivated.

Glorious Discontent.

I want specially to remind you that in thus urging on you the importance of what is called practical knowledge I do not wish you to become only what is called *practical men*. Unless you have that love of all things good and beautiful —that glorious discontent with the gross, the ugly, and the mean, which impels you in your day and generation to make them better, and make the hut of the labourer or the mansion of the rich man fit settings for noble lives—unless you cannot help but throw yourself heart and soul into architecture, as the art of making kirk, or mill, or mansion, or all that man builds for use or pleasure, and all the accessories in gardens, furniture, hangings, no amount of practical knowledge will avail you.

Inertia of Men and Things.

Everything seems arrayed against the architect. The inertia of men and things which is so appalling must be overcome; you have to go out to do battle with your human material, which is as hard and stubborn as your brick and stone. Your county councils and local authorities rise up against you, with their universal objection to everything that makes for beauty. When you feel that oak is the right material your purse keeps you to deal; or when you want for grouping and composition a high-tiled roof, a certain noble lavishness of brick and mortar, the quantity surveyor reminds you of the increasing cube; when you want a cornice of 5 ft. projection to make that deep shadow on your street front, the charm of which you had brought from Florence, the county councils, treating you like a child, says you can't have it, and that's enough. But it is in this kicking against the pricks that the value of our early studies as well as our late practice comes in.

Let your early studies be so directed that prospective employers may instinctively realise "Here is a man whom I can trust, who is in such sympathy with my own ideas that I can trust him as myself," and you find, sooner or later, that future practice will justify them.

Meeting.

Sir Brumwell Thomas presided, in the absence of Mr. Walter Cave. Before Mr. Dunn's paper was read, the following gentlemen were unanimously elected:—A. E. Maxwell, 109, Uxbridge Road, W., proposed by H. L. Samson and A. Potter; C. Rowntree, 11, Hammersmith Terrace, W., proposed by A. Potter and H. L. Samson; A. C. Harbottle, County Chambers, Exeter, proposed by E. J. Harbottle and hon. sec. (by order of the Council).

Discussion.

Mr. Gerald Horsley, in proposing a vote of thanks, congratulated Mr. Dunn upon producing such a very human, sympathetic, and kindly paper.

Mr. H. P. G. Maule hoped that he could say without impertinence that they had listened to an eminently sane paper; a paper that not only preached commonsense, but held up an ideal.

The following gentlemen joined in the discussion:—Mr. Walter Millard, Mr. Curtis Green, and Mr. Louis Ambler. Sir Brumwell Thomas having summed up the discussion generally, Mr. Dunn briefly responded.

Correspondence.

Advice to Patentees.

To the Editor of THE BUILDERS' JOURNAL.

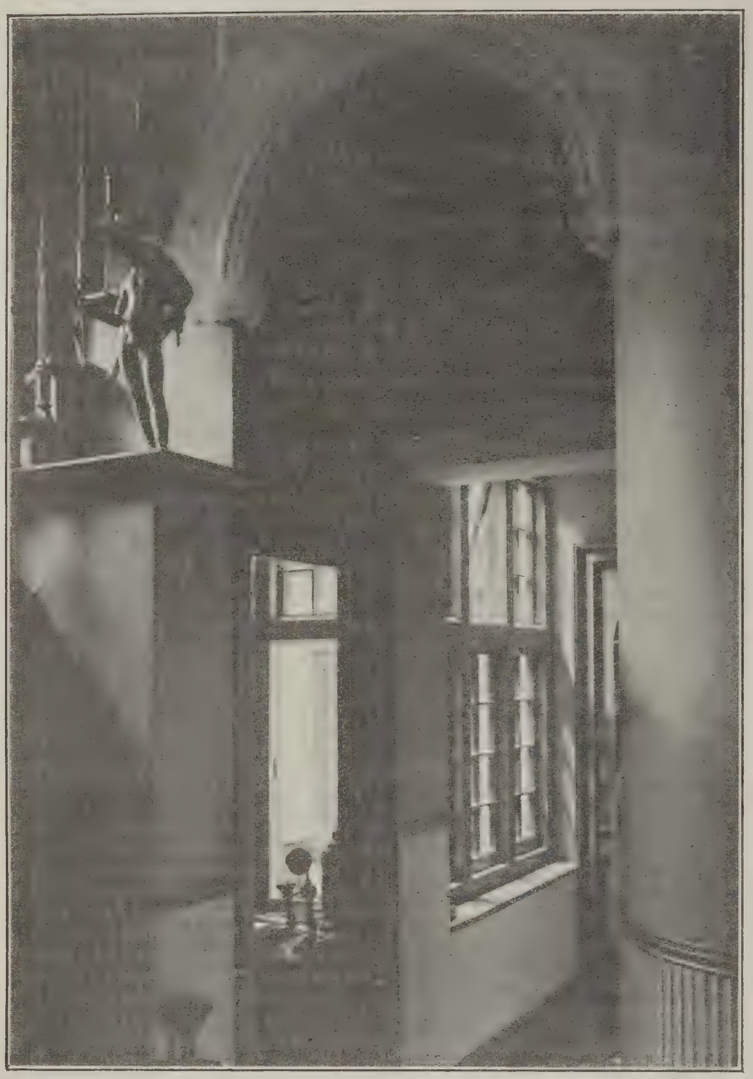
SIR,—I would like to give those of your readers who are interested in patents a word of warning with regard to the specious tales which some patent agents tell. I came across an instructive case a week or two ago. A young man, who had invented an article, had written several patent agents asking their best terms for the disposal of the patent. Each agent replied (with one exception) that they could not guarantee the disposal of the patent; the exception being an agency who replied that they were intensely interested in his patent, and that they thought they had a client who would give him £400 for the patent rights for Germany, £400 in France, and several other large amounts for other countries, subject to the patent being patented in these countries. They also stated that they did not want the job of procuring the necessary patents, but he could have it done through his own agent. This I consider was a subtle touch, because it was only natural for any man who is about to procure £2,900 (which is the amount these patent agents held out to him for the sole right of this simple device), that he would in that case place it with the agent who was going to get him this amount.

If any such hopes are held out to any of your readers who are inventors, I trust that they will reply that they are quite prepared for the agents to take out the patent abroad if the agents pays the fees himself, and deducts same from the amount to be paid for the patent rights. This young man had actually paid £70 for fees and patent rights.

I have personally invented and patented an article, and know what I had to go through, thinking that I should startle the world with my invention; but I was glad to sell it for £200 after working it myself two or three years. This was more years ago than I care to remember, but it exists very vividly in my memory, and I never come across an inventor but what I feel the greatest sympathy for him.

I remember ten years ago two young men came to see me with a model of a lift. These men were joiners employed at a flour mill, and as there had been an accident or two owing to men falling down the lift shafts, they had invented automatic doors which opened and shut as the lift went up and down the shaft. They had spent about £100 in making and patenting this lift, and the model they brought with them was about six feet high and made most elaborately of polished mahogany. They had a small arrangement by which they could fix it on to a gas engine, and it worked splendidly. They asked me whether I could undertake to put it on the market, which I had to decline to do, for as some of your readers are aware, my business is that of a builder and building material merchant, but I was so much in sympathy with these joiners that I sent the model to London and showed it to some of the bigger lift manufacturers. The manager at one place appointed an interview with us. He explained that most of the lifts nowadays were worked by electricity, and would be more and more so as time passed, and that speed was the desideratum; which would necessitate the gates opening and shutting so quickly as the lifts flew past that they would knock over anyone standing near to them, and that the gates would be very soon smashed to pieces by their own velocity. I could see at once when he said that the patent would be of no use to them, that he was correct, especially after our interviews with the other lift makers. It was most pathetic to see these two joiners. They could see that their savings of years had vanished. They had hoped that this lift would put them out of the reach of want and bring them a nice little competency in royalties. Altogether, I hope I shall never again have such a disheartening experience.

My object in writing this is to warn others to be careful of the agents—*i.e.*, always to choose a reputable agent of some standing, and to not let enthusiasm for their inventions carry them beyond the bounds of common sense.



J. H. KERNER GREENWOOD.

King's Lynn.

The Architectural Profession of To-day.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I heartily agree with "Registrationist" (writing in your issue of November 18th) in praise of the series of articles on the architectural profession, and further, I should suggest that these articles most certainly be continued. Results may not come at once, but they are certain to come in the end if we are only content to await the natural course of events. These articles,

ALTERATIONS TO NO. 19, UPPER BERKELEY STREET, LONDON, W. ALAN E MUNBY, M.A., A.R.I.B.A., ARCHITECT.

unlike fiction, do not only retain their interest while they are fresh; they gather interest as they go on, and when sufficient interest has been aroused we may expect to see the fruits beginning to show. Why, at present interest is only just awakening. Surely (when our expectations have been aroused) it would be a pity to damp them at so early a stage.

The subject is of such great width that the series of articles, able as they are, do not, I venture to think, cover more than a portion of the ground. The proper education of architects in matters of architecture is of primary importance, but it is certain they will not succeed unless they also know how to manage the business side of their profession. The public, too, will be influenced much quicker by business qualities than by probably any others, and the influence of an unbusiness-like minority would doubtless outweigh the counter-influence of the majority of business-like men. One notices defects so much more easily than good points. The public to-day, as we all know only too well, generally speaking, more or less ignore architects, and clients often treat them almost like a higher class of servants.

I am sure, therefore, that articles on the business aspect would be greatly welcomed. Architecture has got a value like any other calling demanding skill, talent, intellect, etc., though, of course no one can rightly estimate the true value of art. However, architects have as much right to their commission as the stockbroker to his, and yet, with all due deference to the stockbroker, the architect does infinitely more work for his money. When one thinks of the tremendous number of drawings which are got out in an office (some of which being for jobs which never go forward) and the large staff which is often kept, clerical and architectural, it is a marvel, especially in the face of bad debts also, that architects succeed so well as they do.

What it amounts to is this, that while there is a well-defined agreement between the client and the contractor, there is no provision whatever as between the architect and the client. I do not say there should be a similar agreement, but that the requirements of the client and the obligations of the architect should be made clear. Some clients are always calling at the office or writing, and generally making work or wasting time. We must not forget that each time a design is altered at the client's caprice, the result, as a rule, is not for the better, and that a house thus built simply brings discredit, not on the client, but on the unfortunate architect. True, he can always refuse such jobs; but, as a rule, that is just what he does not wish to do. If he did, it would not be a real remedy, but only a "get-out" expedient. An article which would throw light on this subject and make clear how far an architect is liable regarding a client, and how to deal with trying cases, would do much to place matters on a firmer business basis. Architects do not exist to be used as tools by those who often do not want to build at all, or if they do, have not the funds necessary to do so. Neither do architects supply plans and estimates free.

Another article which undoubtedly would be of use is one on the law in relation to the architectural profession. Most people, even the legal profession, seem to regard it as an exceedingly obscure question altogether. Perhaps someone may be found who will make clear to us the rights, status, and responsibilities of an architect. A selection of law cases might prove instructive in this connection. Yet another article, dealing with by-laws, might well be written. To urge the necessity of an entire revision of these and reconstruction on altogether new and progressive lines is to urge a commonplace. It is also unnecessary to say that building and architecture will not be stimulated till it is done. Apologising for the length of this letter, and trusting, if indeed I dare trust, that it may meet with some slight response.

A REGULAR READER.

Cleaning Down Old Stone Buildings.

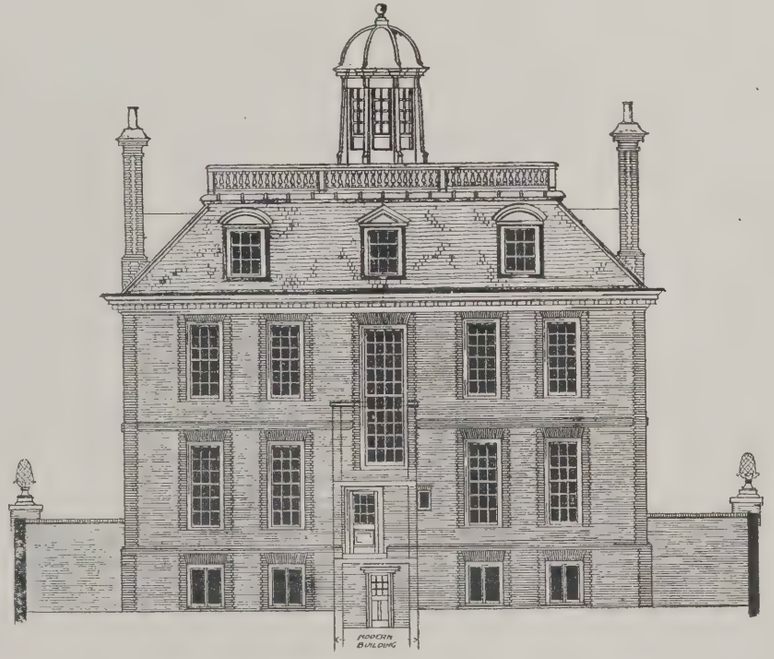
To the Editor of THE BUILDERS' JOURNAL.

SIR.—We have read the correspondence appearing in your journal on the above subject, and we notice that Mr. Bishop, who is presumably an architect, seeks advice as to whether or not he should recommend his client to clean an old stone building (which, judging by his description, has a decayed outer skin) by either of the processes where a considerable amount of force will be used. We feel tempted to offer him Mr. Punch's advice to those about to marry—"Don't!"

Our connection in the West End is considerable, and we are frequently consulted as to the advisability of cleaning down a front in the condition suggested, and our usual answer is "Don't." Nevertheless, we are strong supporters of the preservation of stone buildings when this is done properly. But there is a vast difference between "preserving" and "destroying," although we are sorry to observe that there are apparently large numbers of people who seem unable to make the distinction. BYWATERS AND SONS, LTD.

London, W.

SIR,—I have served about thirty years as clerk of works in various parts of the country, and have been employed on buildings which have been cleaned down by the steam brush, as well as the sand-blast processes, and my experience is that, provided the stone shows no signs of decay, no apparent damage is done to the face of the stone beyond making it more spongy; but that where decay has already commenced the cleaning shows up the bad spots very prominently, and then the trouble begins about who recommended it, and how the repairs are to be effected.



There is, however, one very annoying aspect of some of these cleaning-down jobs. I think I can safely say that on

MEASURED DRAWINGS. No. 2. EAGLE HOUSE, LONDON ROAD, MITCHAM, SURREY (CONTINUED).

MEASURED BY JOSEPH SEDDON AND L. F. JONES. DRAWN BY JOSEPH SEDDON.

every job with which I have had to deal, I have had to bear a large amount of abuse from the public, who either complained of being blinded with sand or of having their hats and coats damaged by the steam and dirt. Demands for redress and threats of law suits generally followed.

With respect to preservatives, I have seen many preparations that were so-called; but I am convinced that oils are of no use. The effect disappears very soon, and the stuff usually discolours the stone.

If there is in existence a perfect system of cleaning and preserving stonework, I, for one, would be very glad to hear of it. N. BAKER.

London. N.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Referring to a letter from Mr. Hungerford in the current issue (November 18th) of your excellent journal, I venture to send you a leaflet dealing with the preservation of stone by the Baryta treatment. This is a process which has now been in use for some years, and has proved very successful. The solution penetrates into the stone from 2 to 4 inches, and is not a mere wash for the surface, as are most so-called stone preservatives.

This treatment is inexpensive to carry out, and is not protected in any way by patents. You will, no doubt, recollect that it was referred to in the report of the Committee of Architects upon the condition of St. Paul's Cathedral.

I shall be pleased to give your correspondent any further information should he require it. HAROLD E. CHURCH.

130, Temple Chambers,
Whitefriars, E.C.

[The leaflet mentioned, of which copies have been kindly forwarded to us, is signed by Dr. A. H. Church, Professor of Chemistry in the Royal Academy Schools, Shelsley, Kew Gardens. In this it is explained that the baryta water is a solution in distilled water of barium hydrate, also known as barium hydroxide, and as hydrate of baryta.—ED.]

To the Editor of THE BUILDERS' JOURNAL

SIR,—With reference to the letter by Mr. Campion in your issue of November 11th, will you allow us to endorse his opinion that it does not do to clean stonework without covering with a protective coat or solution? We are using on many buildings in London a special preparation, which is apparently a great success, and we shall be pleased to send particulars of it to any one who so desires.

MARKHAM AND MARKHAM.

79, Essex Road, N.

Our Plates.

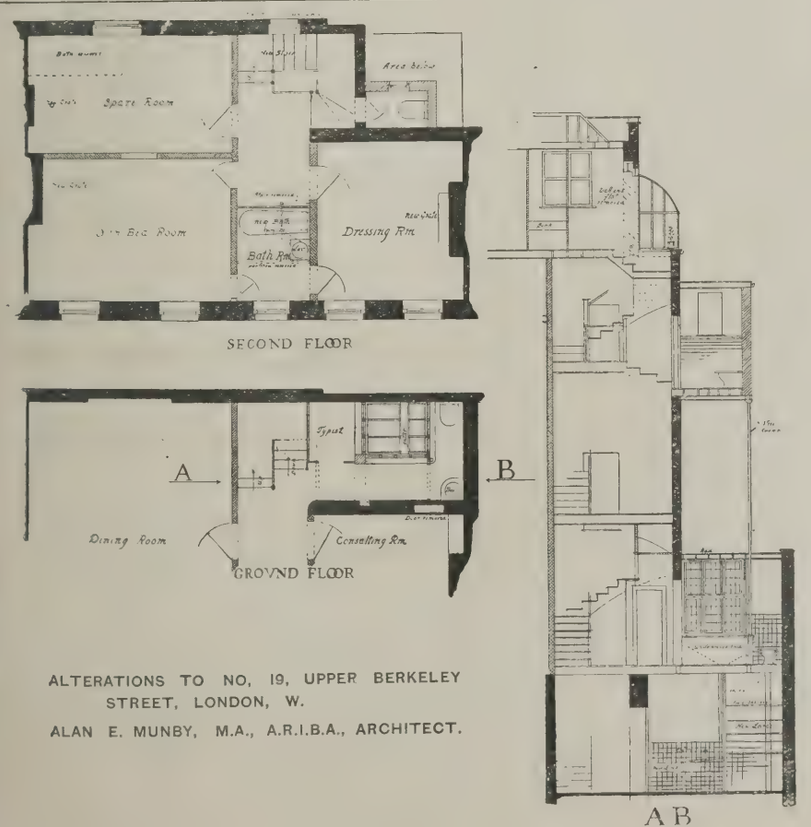
New Narthex Church of the Holy Angels, Hoar Cross.

Our illustrations show the elevations of the new narthex which has been placed at the West end of the Church of the Holy Angels, Hoar Cross. The late Mr. G. F. Bodley, R.A., made the rough sketches for this, which have been worked and carried out by his partner, Mr. Cecil G. Hare, 7, Grays Inn Square, W.C.

The narthex leads into the church with three arches pierced into the west wall, these being filled with very rich iron grylles, relieved with gilding. It is executed in red stone like the rest of the church, and the pavement is of black and white marble. The roof is of English oak, richly carved. The two figures on each side of the west entrance are St. Gabriel and the Blessed Virgin. The windows are filled with stained glass, with the family coats of arms.

A memorial has been placed inside to the late Mr. G. F. Bodley, R.A.

Measured Drawings, No. 2, Eagle House, Mitcham, Surrey.



We give this week the second plate of the measured drawing of Eagle House, particulars of which we published in our issue of November 25th. A photograph of the house is also given in the text. The interior panelling and details will be given in subsequent plates, accompanied by photographic views.

Alterations to No. 19, Upper Berkeley Street, London, W.

It often happens that professional considerations demand continued residence in houses in which space requirements have much outgrown accommodation, providing some interesting problems for solution by the architect. Such were the circumstances in this alteration. The problem to be solved was the provision of a bathroom proper which should release the bedroom so used, a ground floor lavoratory, and space for cloaks, a small typist's room, and improved sanitary accommodation.

Adjoining the approach to the new lavatory and under the stairs a typist's room was obtained. This enclosure ran out very awkwardly from under the stair soffit and cut into this rapidly rising soffit in a manner which made some treatment essential. The illustration shows the concealment of this soffit by a plaster arch.

By the removal of part of the main stair wall, the introduction of girders at two levels and the use of an iron framed skylight, it was found just possible within the light and air angle to continue the main staircase to the top floor and thus do away with the separate attic stair, which, while gutting one top floor room, provided two new rooms on the street elevation. That on the second floor, conveniently situated between the principal bedroom and dressing-room, provided the much needed bathroom. Other difficulties appeared, however, for all the internal walls of the house were mere partitioning, some of which was composed of 3in. by 2in. studs. As a fireclay bath weighing (empty) over seven cwt. was very much desired for electric bathing, this matter required consideration. Eventually a separate floor was made for the bath itself, and this was slung by steel rods concealed in the partitions and running up through two storeys to a steel joist in the roof spanning the space from wall to wall, which it had been found necessary to insert to carry a water tank displaced by the stair alteration. Finally the top rooms were remodelled and space found for a housemaid's closet on the top landing. The net additions to the house within the original area were thus a lavatory, cloak lobby, typist's room, bathroom, and housemaid's closet, while the top floor was converted from an attic into a suite with a well lighted landing on a par with the floor below. The whole alteration, which was carried out by Messrs. T. Henwood and Son, 7, New Quebec Street, Portman Square, W., and which included a hot-water installation and entire redecoration of the house, was completed in seven weeks under a penalty and bonus, part of which latter was earned. The architect was Mr. Alan E. Munby, M.A., F.R.I.B.A.

Notes and News.

Scottish Ecclesiological Society.—A joint meeting of the Edinburgh and Glasgow branches of this Society was held at Paisley Abbey the other day, when Mr. Macgregor Chalmers, architect, delivered an address upon the history of the building, describing the various changes which had been made upon the fabric in mediæval times. The origin of the plan was traced to Cerisy Abbey, in France, and the treatment of the transepts compared with that at Winchester and Ely Cathedrals. The party was then conducted round the Abbey, and the various periods of the existing structure explained by the lecturer.

* * *

The North-Eastern Centre of the Sanitary Inspectors' Association has held a general meeting at Cleckheaton, at which the chairman of the General Council of the Association (Mr. G. H. Anderson) made a statement as to the progress of a scheme for the establishment of an examining body other than the Royal Sanitary Institute, with whose position the association is dissatisfied.

* * *

The Bishop of London's fund for church extension has, the bishop stated the other day, built, during the past forty years, 220 churches. At least five new churches every year, he said, are required within his diocese in order to keep pace with the growth of population. At the present time, he added, forty new churches are in course of erection in London.

* * *

A stained glass window of unusual interest has been unveiled in the north aisle of the parish church of St Stephen's-by-Saltash, Cornwall, corn and birds in a beautiful landscape being represented with more than ordinary success in form and colouring. It is erected to the memory of the late Mr. George Adams, J.P., and has been designed and constructed by Messrs. Fouracre and Son, of Plymouth.

* * *

The Royal Sanitary Institute has just issued a list of the Fellows, Members, and Associates elected in November of the present year, from which it appears that there are six new Fellows, seventeen new Members, and ten new Associates.

* * *

The old Tudor House from Ipswich, which was erected in the grounds of the Franco-British Exhibition, has been purchased by the Hon. Ivor Guest for re-erection at Ashby St. Ledgers. The house bears the date 1563, and is regarded as a typical example of a well-to-do merchant's house of the days of Elizabeth.

* * *

London's New County Hall formed the subject of an interesting question at last week's meeting of the London County Council. The chairman of the establishment committee was asked whether, in view of the interest being taken outside in the matter, anything had been done to modify the plans already presented. The chairman (Mr. R. C. Norman) said the architect was at work on the plans, but the committee had not received a report from him.

* * *

Mr. W. Harvey Brown, M.S.A., has resigned his position as permanent architect to Messrs. Rowntree, for whom he has completed new factories at the cost of more than one hundred and twenty thousand pounds sterling, and also the redrainage of the Cocoa Works. Mr. Harvey Brown is now commencing practice at Standard Buildings, Leeds.

* * *

It is stated that by adopting reinforced concrete for their new 9-mile line of pipes, the Clydebank and District Water Trust will effect a saving of £550 per mile as compared with the cost of cast-iron pipes.

* * *

The coming timber famine, it appears, is to be considerably relieved by exploitation of the forests of Uganda and of Dominica. Concerning the latter, which is one of the larger islands of the British West Indies, it is announced that a company is being formed to erect there some sawmills and a railway. The forest lands of Dominica cover about 120,000 acres, and half of this may eventually be available as a source of supply.

* * *

The condition of many of the buildings in the Temple is said to be giving considerable uneasiness to the Benchers. The signs of decay are attributed to movements in the subsoil, and it is stated that many of the buildings will have to be either under-pinned or pulled down. A building in Essex Street, which is on the west boundary of the Temple, has had to be shored up.

* * *

"Nine sons and a father, builders," is the title to an interesting family group depicted in the "Daily Chronicle" of December 2nd. When the photograph was taken, Mr. Walter Ward, of Hammersmith, and his nine sons, were all working on one job.

At the recent bye-election to fill the vacancies on the Council of the Metropolitan Borough of Shoreditch, Mr. G. H. Lovegrove, of the firm of Messrs. Lovegrove and Papworth, 374-8, Old Street, E.C., architects and surveyors, was elected for the Moorfields Ward by a large majority.

* * *

Junior Institution of Engineers.—A large number of members of this Institution availed themselves of the invitation to visit Messrs. Siebe Gorman and Co.'s Submarine Engineering Works, in Westminster Bridge Road. After being received by Sir Richard Awdry, K.C.B., one of the directors, they listened to an address by Dr. Leonard Hill, F.R.S., on the physics and physiology of diving, caisson disease, etc. Demonstrations were then carried out in the large experimental diving tank to illustrate the following: diving apparatus as used in the British Navy, fitted with telephone, and electric lamps; self-contained diving apparatus employed in cases where the ordinary apparatus with pumps and air pipes would be impracticable; the Hall-Rees self-contained dress, enabling men to escape from disabled submarines. A glass-fronted, air-tight chamber, fitted with dense fumes, was brought into use for demonstrating the method of operating with the self-contained breathing apparatus in irrespirable atmospheres, for rescue work in mines, etc. Mr. H. A Fleuss, the inventor of the first apparatus of this description, also spoke, giving an account of his experience in connection with the flooding of the Severn tunnel, and other particulars of much interest. Some of the members donned the diving dress, and made descents into the tank; and at the concusion of the visit, on the proposal of Mr. J. Wylie Nisbet, seconded by Mr. Geo. T. Bullock, vice-chairman, a cordial vote of thanks was passed for all that had been arranged to render the occasion interesting and agreeable, Sir Richard Awdry responding.

* * *

A new lych gate at St. Andrew's Church, Ham Common, Surrey, which has been erected in memory of Queen Victoria's reign, from a design by Mr. George Widdowson, of Richmond, Surrey, was dedicated by the Archdeacon of Kingston, on Sunday, November 29th.

* * *

The Carpenters' Company, having in view the decadence of apprenticeship, has decided to give, in its Hall, a series of lectures on preliminary design in the constructive arts, in accordance with its ancient traditions, for the advancement of the best work in the arts connected with building. The lectures will, in the first place, be for all craftsmen and those engaged in actual trades in connection with the constructive arts, but all of either sex and of any trade or profession are invited to attend. Admission will be free by ticket. The lectures will each last about three-quarters of an hour, and at the close questions on them may be asked. At the end of the course, prizes will be offered to those who have attended not fewer than eight lectures. Between January and April next the following gentlemen will give lectures on the various arts connected with building:—Messrs. Weir Schultz, Guy Dawber, Romney Green, Troup, Voysey, Baillie Scott, Spooner, Laurence Turner, and Starkie Gardner. Tickets of admission to the lectures can be obtained from Mr. J. H. Freeman, clerk, Carpenters' Hall, London Wall, E.C.

* * *

At the ordinary meeting of the Institution of Civil Engineers, held on Tuesday, December 1st, Mr. James Charles Inglis, president, in the chair, it was announced that 182 candidates had been admitted as students.

* * *

Doulton's patent pneumatic water-waste preventing valve for water-closets, as approved by the Metropolitan Water Board, is shown in various adaptations in a special illustrated pamphlet issued by the firm (Doulton and Co., Ltd., Albert Embankment, London, S.E.). Among the advantages claimed for the valve are: noiselessness; absence of chains, pulls, and ball-valves, which are all more or less likely to get out of order; automatic closing, whether or not the handle is kept raised; regulation of the amount of water passing each time; ease of operation, either by push-knob or lever handle; simplicity, so that no special knowledge is required for the fixing; and compactness, enabling it to be placed in positions that are insufficient for the accommodation of the ordinary flushing apparatus.

Mr. R. G. Kirkby, A.R.I.B.A., of Cardiff, has been appointed city architect for Bradford, in succession to Mr. F. E. P. Edwards, who is now city architect of Sheffield. It is stated that Mr. Kirkby is thirty-three years old, and is architectural assistant to the Glamorganshire County Council. There were 115 applicants for the post, of which the salary is £300 a year.

CONTRACTORS' SECTION

(MONTHLY.)

THE ARCHITECT'S CERTIFICATE: SOME LEGAL ASPECTS.*

By A. M. Brice.

(*Continued fom page* 426, *No.* 721.)

III.—The Conclusive or Final Certificate.

What manner of writing, then, may be necessary to make a certificate valid, and, in the case of a final certificate, conclusive? In the first place, any conditions imposed by the terms of the contract must be complied with. If the certificate is to be one of satisfaction, or of payment, or both, then one or the other or both it must be. But if one of payment is required and given, it will imply satisfaction; and if one of satisfaction is required, a certificate of satisfaction will secure payment. It will do this, although no balance is struck, and no particular amount is specified. Any payment for extra work, and, indeed, any amount that may be outstanding may be left for ascertainment, either by the method indicated in the contract, or failing any such, by the ordinary computations for quantity or value, and yet the certificate will be conclusive.

In Pashby *v.* Birmingham Corporation [1856, 18 C.B. 2], where the contract stipulated that certain payments should not be made "until within three months after the architect should have certified the completion of the whole work to his satisfaction, it was held that the architect's certificate of final completion was sufficient, without mentioning the amount remaining due in order to enable the contractors to recover what was right and proper." In delivering judgment, Chief Justice Jervis said: "I do not think that the architect's final certificate of the completion of the work need contain any mention of the amount; but I think that the plaintiffs may recover on a general certificate. . . . It seems to me that it is not a condition precedent to the plaintiffs' right to recover what may be due to them for the balance, that such balance should be ascertained and mentioned in the certificate of the final completion given by the architect." The three other judges forming the court concurred, Cresswell J. pointing out that "the certificate of final completion is clearly sufficient, without reference to the amount that may be due to the contractors, whether in respect of work done under the contract or of alterations or additions."

So, too, it has been held that the certificate that the last payment is due will satisfy the contractual requirement of a certificate; but if the contract in this case had required that the certificate should be couched in a specific and different form, it would have been inadequate. The terms of the contract, in fact, are the determining factors in all questions affecting the certificates, always supposing, of course, that the terms exist and are explicit.

*Substance of a paper read before the Institute of Builders, on November 11th, by Mr. A. M. Brice, of the Middle Temple, and Oxford Circuit, Barrister-at-Law; author of "The Legal Liability of the Architect."

The Right of the Builder to Recover Payment without a Certificate.

There is no proposition in building law laid down more clearly than that generally a builder is unable to recover payment from the building owner without a certificate from the architect, if it is a term of the contract that the issue of such certificate shall be a condition precedent to such payment.

The great exception, of course, to this rule is that if the certificate has been fraudulently withheld, and the building owner has either colluded with the architect in such withholding. or had made use of the architect's fraud to commit a breach of the contract, then the builder may dispense with the certificate and bring his action against the building owner.

In addition to this general rule, too, there are other grounds on which recovery can be had without a certificate—the prevention of the employer by the dismissal of the architect, the prevention by the employer of the performance of conditions imposed by the contract, prevention by the employer by failing to appoint an architect with power to certify, and, of course, recovery of payment without a certificate may be obtained when the employer consents to waive the condition which was clearly inserted for his own benefit and protection.

But the general rule remains. If the parties have agreed to be bound by the certificate of a third person on whom they have also agreed, it is not ordinarily competent for a court of law to intervene if that person should neglect to certify.

This was well stated by Lord Justice Mellish in Sharpe *v.* San Paulo Railway. "Whenever," he said, "according [1873, L.R. 8 ch. p. 612] to the true construction of the contract. the party only agrees to pay what is certified by an engineer, or what is found due by the arbitrator, and there is no agreement to pay otherwise, that is to say, in every case where the certificate of the engineer or arbitrator is made a condition precedent to the right to recover, there the court has no right to dispense with that which the parties have made a condition precedent, unless, of course, there has been some conduct on the part of the engineer or the company which may make it inequitable that the condition precedent should be relied on. If nothing of that sort has happened, then the parties are bound by that which they have made a condition precedent."

So, too, in the case of Scott *v.* Liverpool Corporation [(1858), 27 L.J. Ch. 641], where it was held by Chief Justice Erle that in law, where the engineer is interposed between the parties and made the absolute judge of the performance of the contractors, and where the contract gives no right to the contractors to demand payment and places no liability on the employers to pay unless the condition of obtaining the engineer's certificate has been fulfilled, the obtaining of such a certificate is a condition precedent to payment—save in the case of the agent's incapacity through collusion, corruption or otherwise. Similarly, in the same case, Vice-Chancellor Stuart held that neither was there in equity any right or power to impose on either of the parties to the contract any other terms than those they had prescribed for themselves, and by which they had agreed to be bound. "It is of the very essence of the contract," he said, "that no sum shall be considered due and owing to the plaintiffs on account of any of the works executed by them, unless the engineer shall certify the amount.'"

It is clear, however, if the employer has been guilty of any action which would amount to a prevention of the performance of the conditions of the contract affecting the delivery of the certificate, that the certificate may be dispensed with. It does not matter in such a case whether such action be in collusion with the architect or not. So, too, even where the architect be alone fraudulent in withholding the certificate, the employer can be proceeded against when it can be shown that he is utilising the fraud, or even the mere misconduct of the architect, in order to commit this breach of contract. Thus, in Smith *v.* the Howden Union [1890, Hudson, vol. II., p. 151, 3rd ed.], Lord Justice Vaughan Williams said: "The certificate of the engineer seems by the contract to be a condition precedent to the right to payment of the price and every part of it, and I find no case in which it has ever been held, either at law or in equity, that where a contract provides that the contractor, as a condition precedent to the right to payment, whether of intermediate instalments or of the final balance, must obtain the engineer's or the architect's certificate in writing, the price can become payable as such without the production of such certificate.

"The case of refusal by the engineer in collusion with the building owner to grant certificates is spoken of as an exception. It is not, however, really an exception. In such a case, the building owner and engineer fraudulently prevent the contractor from doing that which is necessary to obtain the price—namely, from getting the certificates, and what is recoverable by the contractor in such a case is not really the price, but damages." And the court held that while the employers had not colluded with the engineer they had adopted his acts, and the contractor's remedy was damages against the employer for wrongfully preventing the contractor from completing the contract work by wrongfully taking possession, the measure of damages being the amount to which presumably the contractor would have been entitled if the work had been completed, and had the engineer thereupon issued such a certificate as he ought to have issued.

But, passing from the cases where the employer is originally or becomes subsequently in fault, and those in which the architect acts fraudulently either by himself or in collusion, we reach the not unfamiliar case where, without evidence of fraud, the architect unreasonably or negligently fails to certify. It has been repeatedly said that in such a case the builder has no right of action against the building owner. Law insists upon the production of the certificate, and so does equity.

In Emden's text-book on "Building Contracts" (4th Ed.) it is stated on page 105 that "in cases where the certificate is negligently withheld by an architect, the usual clause, making his certificate a condition precedent to payment, places the builder in a very unfair position. It is always very difficult to prove collusion between the employer and the architect, and unless this can be done, or the particular case can be brought within the cases referred to at page 104 supra [of the text-book], the builder is practically left without a remedy."

The cases referred to at page 104 of the book do not deal with the point, but those on pp. 102 and 103 do; these are cases of collusion, fraud, or other prevention by the employer, which do not cover the case where the architect is not alleged to be acting fraudulently. This statement undoubtedly embodies the general impression, and it has been brought to my notice on several occasions in the course of my professional experience. I may add, too, that Hudson, in the 3rd (and latest edition of his work on "Building Contracts," states, on p. 418, that "mere unreasonable refusal of the architect to certify, acting on his own judgment without interference by the building owner, gives no ground of action to the builder against the employer."

From these statements it would seem that English law provided no relief for a person so hardly situated as a builder be if, owing simply to a negligent failure and omission on the part of the architect to certify, he should be unable to recover payment otherwise properly due and payable from the building owner. Somewhat curiously, however, amongst the cases collected in the 2nd vol. of Hudson's valuable work, but not included in Emden, is a case which appears to provide the remedy—Kellett *v.* New Mills Urban District Council, and it will be of interest to members of the building and allied industries to have this case brought to their notice.

In Kellett *v.* New Mills Urban District Council, the plaintiff had agreed to perform certain work for the defendant Council to the approval of the defendants' engineer, and it had been agreed by the defendants that they should pay the plaintiff upon the certificate of that engineer. Time went on, and the engineer never addressed himself to certify as to certain stages completed and amounts due, but, said the plaintiff, wrongfully refused or wrongfully and unreasonably delayed so to certify. The defendant Council was alleged to have taken advantage of their agent's refusal or his delay, and themselves deferred payment. No fraud was alleged. The case was heard on April 4th, 1900, and was tried by Phillimore J. and a special jury at the Manchester Assizes.

The defendants pleaded (in addition to other pleas) that by a clause in the agreement payments were to be made on the recommendation of the engineer only, at certain stated intervals and at an agreed ratio of the contract price, and the balance was to be paid after certificate of final satisfaction had been issued by the engineer; but no final certificate had been issued, nor had the engineer certified that the whole of the work was in a good and substantial statte of repair, and had been delivered up to his satisfaction as required by the contract.

The plaintiff's reply to this was that he had done all the work he had agreed to do; the engineer was the agent or servant of the defendant Council for the purpose of certifying; the engineer had not addressed himself to discharge his duty as such agent or servant by certifying what was the date of the completion of the work, and what was due to the plaintiff on such completion; but the engineer wilfully, arbitrarily, and persistently refused to so certify, and thereby became and was discharged from his position as engineer under the contract; and the defendants, knowing of such refusal, took advantage of it so as to prevent the plaintiff from recovering the amount due on such completion of the work. The plaintiff, while not alleging fraud, submitted that this conduct of the defendant Council amounted in equity to a fraud upon the plaintiff's right under the contract, and entitled him to the relief claim.

It was found by the jury that the plaintiff completed the work in December, 1897; that no certificate of completion had been given; that the engineer had not addressed himself to determine and certify, but had wrongfully refused or wrongfully and unreasonably delayed so to do; that the defendant Council was aware of such refusal or delay, and took advantage of the same by refusing or unreasonably delaying payment.

Phillimore J., in giving judgment for the plaintiff, pointed out that "the decisions are clear where the employer colludes with the engineer, surveyor or valuer, it is right to pass the engineer, surveyor or valuer by, and seek the determination of the courts as in an ordinary contract; and I see no difference between the misconduct of the engineer, surveyor, or valuer being procured by the employer, and by the employer knowingly taking advantage of the man's original misconduct. . . . I think they (the defendants) knew here not merely that their man was not certifying, but that he was going through the process of pretended enquiry, which was almost worse than his refusing to enquire; and I think that they were bound in those circumstances to have taken some very decided action on their part. I may add that it does not at all follow that the plainttiff is as well off if they do appoint another surveyor, because he may get his money, but get it only after very much greater delay. One of the grounds of complaint is the delay. One of the great grounds is that he does not get his money when he ought to get it and, at any rate, I think the verdict of the jury was right and that the answers of the jury are right."

Mr. Justice Phillimore, in his judgment, practically adopted the language which was made use of by Lord Chancellor Cottenham in 1850 in Macintosh *v.* The Great Western Railway [19 L.J. Ch. 374].

In that case the plaintiff could not obtain payment because the certificate of the engineer was a condition precedent and the engineer had refused to certify. "Their inability to do so," said Lord Cottenham, "has arisen from the acts of the defendants or their agent; and whether acts arose originally from any fraudulent motive or not, I think that to use them for the purpose of defeating the plaintiff's remedy would constitute a fraud which the court will not permit the defendants to avail themselves of, and that therefore they are precluded from raising any objections they rely upon to the plaintiff's equity."

It would, therefore, seem that where an architect unreasonably refuses or delays to determine and certify, and where, in consequence, the building owner also refuses or delays to make the payment which would have been due and payable according to the contract upon the issue of the architect's certificate, it is now possible in equity, if not in law, for a builder to plead that such refusal or delay on the part of the building owner amounts to collusion with the architect in that the building owner is knowingly taking advantage of his agent's misconduct and to a prevention by the building owner of the builder's right to receive or recover payment for the work done in accordance with the contract.

This decision is of great importance to the building and the allied industries, and, although Mr. Justice Phillimore pointed out that in a sense Kellett *v.* New Mills Urban District Council was a new case, and that he anticipated its going further, his judgment has not been taken to the Court of Appeal, and it stands to-day.

SCUMMED OR WHITENED BRICKS.

A Curious Preference.

By A. B. Searle.

In the course of an arbitration case, in which the evidence of a number of architects of good local reputation was taken, it was astonishing to find how many of these gentlemen believed that scummed or whitened bricks are harder than other bricks with a clean surface.

I am not prepared to specify the precise district where this opinion is rife, except by stating that it extends over almost the whole of one of the largest counties in England, but the facts are so interesting as to be well worth notice outside the limits of the arbitration case itself.

In the district referred to, the bricks are almost invariably produced in a slightly scummed condition, and this scum during the firing produces a thin glaze on the surface of the bricks, giving them a vitrified appearance, though on breaking them this vitrified portion is found to be about the thickness of a fly's wing. One enterprising firm installed a kiln of an entirely different pattern from any others used in the neighbourhood, and found to his dismay that the bricks produced in it were refused by a local architect, on the ground that their appearance showed them to be insufficiently burned. An investigation followed, in which it was shown that the bricks from the new kiln were actually harder and more completely fired than were any other bricks made within a twenty miles radius. They were also stronger, in spite of their not having this pseudo-vitrified appearance, which gave them a false resemblance to vitrified bricks.

The architect still persisting in his opinion, various others were called in, and the amazing opinion was elicited from almost all of them that "it was commonly understood among architects and builders that bricks having the appearance of the samples under discussion were harder than those having a dull face, like the bricks from the new kiln"! When the matter was explained to them more fully, they agreed that they were misled by appearances, but still held that most architects would have expressed a similar opinion.

If this is the case, it points to a curious misconception on the part of architects and builders generally on the relation between a slight glaze on the surface of a brick and its strength. To de-

termine whether a brick is partially vitrified, it is not sufficient to see that the surface is non-absorbent; the brick must be broken so as to expose a portion of the interior, and this must be examined before a definite opinion can be rightly expressed. It may frequently happen that with certain clays a slight scum of various salts will form on the brick during the drying or earlier stages of firing, and this is due to the soluble matter in the clay being drawn to the surface, and deposited there by the evaporating water which is removed from the bricks by the heat. This thin scum, on further heating, attacks the clay on which it is found, and produces a glaze not unlike the well-known "salt-glaze" on drain-pipes, but very much thinner. In some cases this glaze is so thin as to be unmeasurable. When it occurs in patches, no one is deceived, but when the scum-glaze is spread fairly evenly over the surface, it may mislead those who have not studied the subject fully, and may in some cases lead to serious injustice to the brickmaker or merchant. By chipping off a large fragment from a brick, and examining the fracture, the difference between a vitrified or partially vitrified brick and one which is merely surface-glazed in parts can be readily seen.

FRENCH SCAFFOLDING.

By A. G. H. THATCHER.

(*Concluded from page* 370.)

Painters' boats are constructed similarly to ours, but again with an important difference. The iron strap to which the hoisting fall is hooked is made much lower (Fig. 19) than with us. Consequently, when the boat is occupied, the point of support being lower in relation to the centre of gravity, it had an increased tendency to roll. Messeiur is, however, ready with an ingenious remedy. By fixing a padded arm, as shown in the diagram, to press against the building, the rolling tendency, which is increased when the workmen are on the inner side of the boat, actually keeps the whole arrangement steadier than it otherwise would be.

Fig. 20 shows a method of erecting raking shores. Each system is cross-braced with that adjoining, but it possesses a peculiarity which is novel to us. Each shore butts at its top end against a needle, but the wall plate is dispensed with.

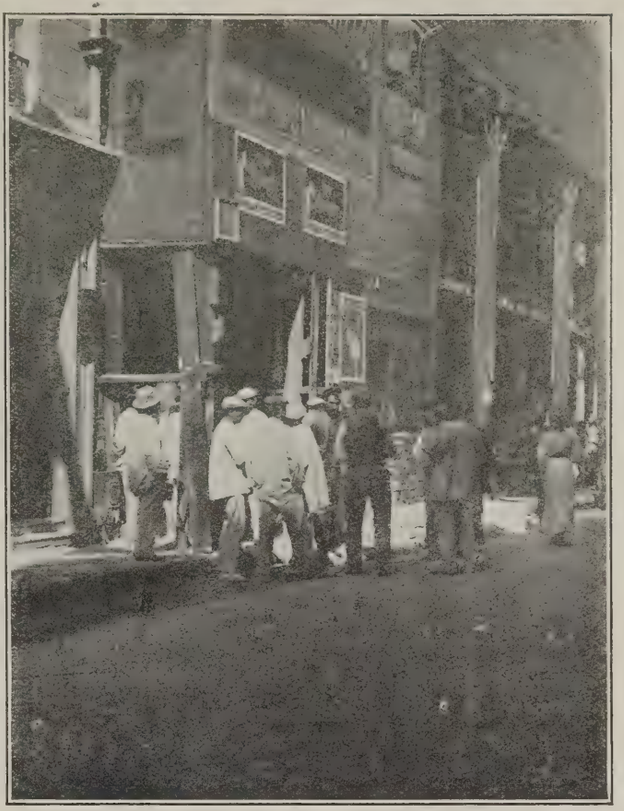

FIG. 21.

Fig. 21 shows a typical group of French workmen, taken during the dinner-hour. Notice will be taken of the blouses and overalls, a custom which bespeaks tidyness, if not cleanliness, and which is worthy of more general adoption.

In reviewing generally these details, one thing particularly impresses the observer. Although the dangers which always exist with temporary structures, such as scaffolding, cannot be greater in France than in this country, one fact is certain—that when calculating for the safe conduct of building operations a considerably less margin of safety is allowed for than with us. It is difficult to know why this should be so. Building accidents, which always draw attention to these matters, have been considered in France, and regulations provided to minimise the dangers. Nevertheless, materials are lighter and methods are not so finished. It leads, perhaps, to some extent, to the idea that building regulations should aim largely to prevent actual defined risks, such as men falling, than interfere with the more scientific side of the question. Scaffolding in France, whether or not it is governed by the rule of thumb methods which so largely obtain here, shows an observance to scientific principles which must be sufficient, or else the actual collapse of such structures would be more frequently heard of.

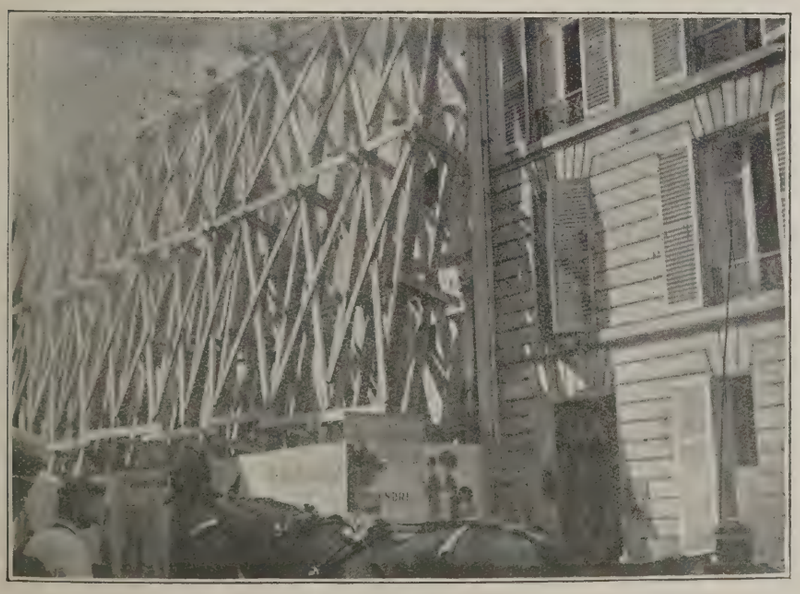

FIG. 20.

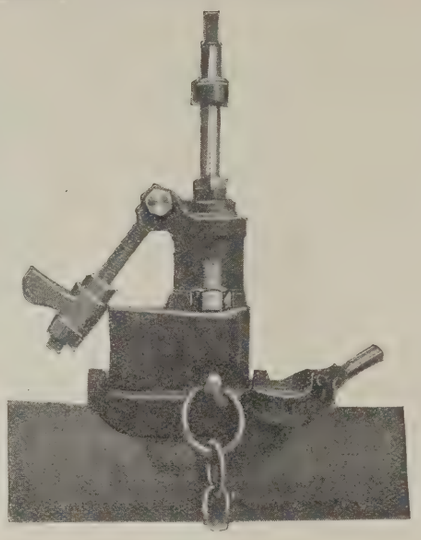
Law Case.

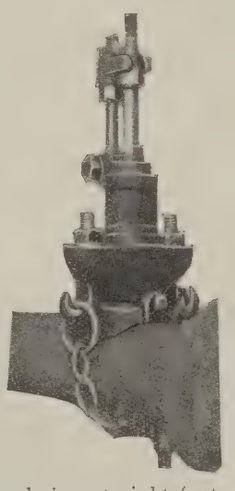
School Buildings and Notice to Surveyors.

At the West London Police Court, on November 24th, Mr. Garrett gave his decision in the case in which Thomas William Willis, district surveyor for Putney, summoned the London County Council for failing to give him notice of intention to erect a school building in Hotham Road, Putney. The defence was that the school building came within the exemption clauses of the Act dealing with public buildings, and that the district surveyor, being the servant of the Council, could not be in a position superior to his employers. The magistrate was of opinion that the County Council were bound to give notice, and he therefore imposed a nominal penalty of 20s., to enable the opinion of the High Court to be taken on a special case.

LABOUR CO-PARTNERSHIP & THE BUILDING TRADE.



The annual meeting of the Labour Co-Partnership Association was held on December 1st at the Church House, Westminster. Mr. Shackleton, M.P., presided. Mr. Vivian, M.P., the secretary, referred to the numerous letters approving of the objects of the association received from Cabinet Ministers, members of Parliament, dignitaries of the Church, and others. Mr. Balfour, as president, in his address, dealt with the value of labour co-partnership in not only removing the antagonism so often existing between labour and capital, but in going deeper than this by increasing the worker's interest in what was essentially his life's work. He was convinced that the real interest of a man's life was not in the money he earned by his work, but in the satisfaction he had in the general result of that work. The actual processes might be monotonous, and indeed the necessary sub-division of labour in modern productive methods made them so; but if a man could feel that he had an interest in the general result, and could take pride in it, that man felt a satisfaction which no mere money payment could afford him. In his opinion, this could be best done by means of co-partnership. He was also desirous of seeing the principle applied to agriculture, so that the agricultural labourer might be admitted to co-partnership with his employer.



Sir Christopher Furness, in moving a vote of thanks to Mr. Balfour, stated that as the result of an investigation in the concerns with which he was connected, the wastage in one year, due to sectional strikes in which the emloyers were not really concerned, amounted to 21¼ per cent. of the wages paid, and represented a loss of 9¼ per cent. on the capital employed. It was a consideration of these facts which had led him to propose a scheme of co-partnership to his workpeople. The annual report refers to some 28 industrial concerns which have adopted co-partnership arrangements of one kind or another with satisfactory results. Two of the concerns are engaged in the building trade. The building trade would appear to present unusual difficulties to the adoption of co-partnership because of the fluctuating character of the personal employee, and yet there is no industry where some system of interesting the men in the quality and quantity of the product is more needed. At this time, when many building businesses are being converted into limited companies, it might be well if this question of labour co-partnership received the careful attention of building trade employers.

CONTRACTORS' PLANT.

The "Donnelly" Under-pressure Gas and Water Main Tapping Appratus, with Ferrule.

This machine is very small, size of body, 8in. by 6½in. by 3½ins.; light, and handy; being of less bulk and weight than the ordinary "non-pressure" apparatus, the total weight, including saddle and bolts, being less than 22lbs. Notwithstanding that the casting is in ⅜in. cast-iron at its weakest point, it is exceptionally strong, on account of its small size and special construction, and is tested to over 300ft. head of water. It has fewer parts than any other "under-pressure" machine, there being no valve or lever to operate when placing the ferrule in position, the whole operation being actuated by the drill spindle. Any unskilled workman can use it without difficulty. The attachment for putting on pressure to drill spindle is handier and less cumbersome than the usual methods in vogue. The reduced size, and fewness of parts, makes it possible to place the machine on the market at a very low cost, it being unnecessary to use special metals to secure lightness. It is especially advantageous for gas tappings, an ordinary tapered gas nipple with a plug of cotton waste or hemp being used in place of the stop ferrule, or a stop nipple in "wrought iron" can be supplied at about 50 per cent. on the cost of ordinary W.I. nipples.

The ferrule is a straight (not a branch) full-way ferrule. It has no loose parts, (beyond the union for connecting to service pipe), at which leakage can occur. It is impossible for a careless workmen to leave the valve partly turned on. It must be on full to complete connection to service pipe. It can be used with equal facility for tapping either on side of main (which most engineers now favour) or on top, and gives a straight lead for service pipe in either position. Can be used at any time for repairs to service, and no special key or cover is needed in connection with the ferrule.

A demonstration of the apparatus, which has been invented and protected by Mr. S. H. Donnelly, one of the engineering staff of the First Garden City Co., Ltd., Letchworth, was given recently, in the presence of Messrs. H. D. Pearsall, M.I.C.E., W. W. Parkinson, A. W. E. Bullmore, W. E. Wort, E. Underwood, C. F. Ball, and a representative of the Metropolitan Water Board. A 4in. main was tapped and a connection made in 30 minutes.

SELF-SUPPORTING CURVED IRON ROOFS.

By T. McGill.

Iron roofs of this type, called "self-supporting" because no complete trusses are used, form a very economical covering where cheapness is desirable, and are largely used where temporary coverings are required, also in all classes of farm work, such as hay barns, shelters, etc. It will be observed that no rafters are used in the construction of these roofs, the galvanised corrugated sheets, together with light bracing bars, being all that is necessary for stability; special care, however, must be used during erection to ensure that the sheets are properly fixed, otherwise a very unsightly appearance will be given to the roof, owing to the sheets not being level.

Limitations of this Type of Roof.

Roofs of this type have been erected up to spans of about 60ft., but cannot be recommended beyond spans much exceeding 30ft., as it is better in such cases to use a proper truss or principal with curved rafter member, the sheets being used only as a covering. In "self-supporting" roofs, the "rise," or height from springing to the underside of the sheets at crown, is usually made 9-40ths of the span (*i.e.*, between 1-4th and 1-5th), and the "rise" or camber of the main tie-rods, about 1in. per foot of sloping tie, or, say, a total camber (measured at centre of span) of 1-30th to 1-40th of the span. The radius of the curve for the sheets may be found as follows:—Let

Let R = radius of curve; r = versine or rise; s = chord or span; then $R = \frac{S^2}{8r} + \frac{r}{2}$

Example: Span = 20ft. 0in., then $\text{rise} = \frac{20 \times 9}{40} = \frac{9}{2} = 4\text{ft. } 6\text{in.}$, and $\text{radius} = \frac{20^2}{8 \times 4\text{-}5} + \frac{4\text{-}5}{2} = 11\text{-}112 + 2\text{-}25 = 13\text{-}36 = 13\text{ft. } 4\frac{5}{16}\text{in.}$

Details of Construction.

A simple rule for finding the length round the curve where the rise is 9-40ths of span, quite near enough for all practical purposes, is l = span x 1.13, where l = length round curve from springing to springing. The spacing of the bracing is usually from about 8ft. to 9ft. centres, and should never exceed 10ft. for ordinary cases; the arrangement and sections of the various members being as given in Table No. 1.

The method of fixing the tie-rods to the sheets is shown in Figs. 1 and 2; the tie being passed through a hole in the sheets and fitted with double hexagonal nuts and two large galvanised corrugated washers curved to fit the corrugations, one outside and one inside the roof. The struts are fixed in much the same manner. The strut itself being what is termed "cut-kneed" to suit the curve of the roof, a large galvanised corrugated washer is placed on the outside, and the whole is bolted together with two ordinary hexagonal bolts and nuts, as shown in Fig. 3. The centre joint for the three different forms of bracing is shown in Figs. 4, 5, and 6, respectively, where two alternative methods are given,

the joint being formed either with or without plates. A good method of fixing the main tie-rod to rolled steel joist stanchions is shown in Fig. 7, the inner flange of the joist being cut away for a depth of 4 or 5 ins., and a jaw formed on the end of the rod, which is bolted to the web of the stanchion. Where the main tie is fixed to a timber eaves beam, a flat steel palm is welded on to the end of the rod, and screwed to the beam, as shown in Fig. 8; and in the case of a roof on brick walls, the main tie is passed through a steel plate bent to form a kind of stool, and fixed with a nut on the outside, the stool plate being fixed to the wall by means of an anchor bolt and washer plate, which is at first built in loosely, and afterwards grouted up with cement. The stool-plate also forms a support for the angle-steel eaves purlin to which the sheets are fixed, the purlin being broken over the centre of the plate and spliced at the joint, as shown in Fig. 9.

(To be concluded.)

SCALES FOR ENGLISH & METRICAL MEASUREMENTS.

By W. E. Barker.

It is now becoming a general practice in modern engineering drawing offices to prepare all drawings for export work with the dimensions clearly figured thereon both to English and metrical scales.

The usual method of calculating metrical equivalents is not only irksome, but takes up a good amount of time. Tables, of course, can be referred to, and this, perhaps, is what is generally done. Referring to tables, however, is not nearly so direct nor so handy as scaling from the drawing and reading the result either to English or metrical scale from the scale itself.

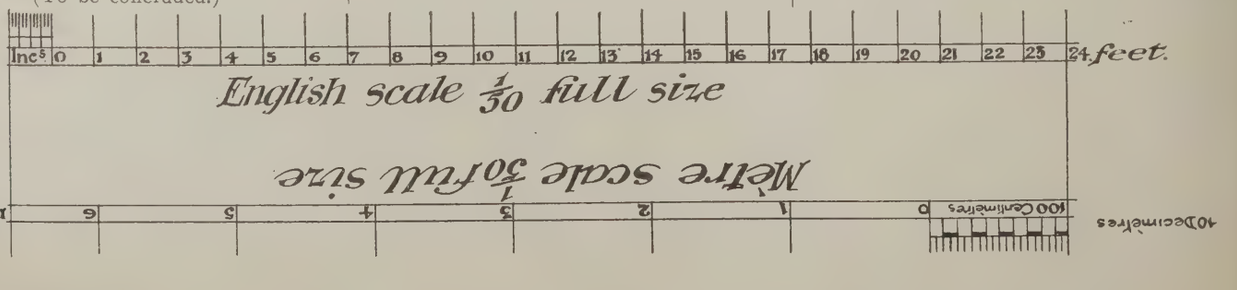
With the scales at present in use, this cannot be done, but by making two scales, one to metrical and the other to English measurements, both reduced, say, to 1/100 to 1/50 full-size, all difficulty disappears.

Suppose, for instance, that we decide to make a drawing 1/50 full size—which will mean drawing to a metrical scale of two centimetres equalling one metre. Plot a scale to this on the drawing, about 12in. long, then plot another scale underneath exactly 12in. in length. Divide this second scale into 50 equal parts, which parts will represent English feet 1/50 full size, *i.e.*, to the same scale in fact as the metrical scale, which is also plotted 1/50 full size.

Further divide the first foot and the first metre on the left-hand side of the scales into 12 parts and 10 parts respectively. The scales are now ready for use.

If a smaller scale is required, all that is necessary is to increase the scale values. For example, to make the scales read 1/100 full-size, each foot on the English scale will read as two feet, and each metre on the metrical scale as two metres, and so on.

If a larger scale is necessary, say, 1/25 full size, the process is reversed. Two feet on the English scale will then represent one foot, and two metres on the metrical scale will read as one metre.



The accompanying scale, drawn to a 1/50 full-size, clearly explains the scheme, which should prove useful to draughtsmen.

LIVERPOOL SCHOOL OF ARCHITECTURE.

The Council of the University of Liverpool had laid before them at their meeting on December 1st a generous offer made by Mr. W. H. Lever, M.P.

The object is to facilitate the study of town planning, and Mr. Lever offers to provide annually, for three years, a sum of not less than £500, and, subject to the needs of the case, not more than £1,000, to be expended on instruction and research as to methods in town planning and architectural landscape. It is suggested that, for the first year at any rate, the greater portion of the grant will go towards a commission of investigation, nominated partly by the University and partly by Mr. Lever, who will visit those countries where the subject has already made any progress. It is then believed that lectures, embodying the report of the commission, and treating of the subject generally, will be instituted. The conspicuous examples of successful town planning in our own country, in addition to Port Sunlight, are, of course, Bournville and Letchworth, and on a smaller scale the schemes of the Normanton Colliery Co. and Sir William Hartley at Aintree, near Liverpool.

The appeal for funds for the preservation of the ancient entrance to St. Bartholomew-the-Great, West Smithfield, is meeting with a fairly liberal response, £600 having been already subscribed towards the £2,075 needed.

Matters of Opinion.

No. 1 (continued).—The Increased Employment of Specialist Contractors.

The following opinion has been received from the BURY AND DISTRICT MASTER BUILDERS' ASSOCIATION:—

In connection with the above question, and the employment of specialists in architectural work, this is a matter that does not affect the town of Bury to the same extent as it probably affects very large towns. Nevertheless, it is a matter about which builders here, at times, get very sore. For instance, it is manifestly unfair to any builder to find items like the following in a set of quantities:—"Allow the p.c. sum of £50 for sanitary fittings, and allow for carriage of same, cartage, unloading, and return of empties."

"Add builders' profit and attendance on workmen fixing same."

Or, again, "Allow the p.c. sum of £50 for carving, and provide all scaffolding and protection to workmen engaged on the work, and add builders' profit."

The same remark applies to fibrous plaster work, electrical installations, etc. Many other parts of the building trade which in days gone by were all part and parcel of the craftsman's business, are to-day put under the name of "Specialists' Items."

If architects are determined to employ these specialists, then what we say they ought to do is, to make the p.c. sum cover the whole of the work in connection with such specialists' items, and not let the specialist go scot-free, as it were, and the builder have to guess at what he considers is a suitable allowance to make. The builder should be paid in the same way as the specialist for what he does. That is to say, the amount of p.c. items should cover all the work in connection with the particular item, and the specialist, if nominated by the architect, should be responsible for his own work.

Many other cases could be mentioned, all coming into the same category of objection, but these, we think, are sufficient for the present.

On the other hand, in the North of England the question of proper quantities often enough puzzles the builder—as, for instance, "One tracery window to detail, complete." Or, again, "One oak entrance door, with frame, casings, lock, etc., complete."

This is also a matter the builders think should be taken up if equitable and reliable tenders are to be obtained.

IN PARLIAMENT.

(By our Press Gallery Representative.)

Durability of Norwegian Timber.

A question recently addressed to the Postmaster-General with regard to telegraph poles has elicited the answer that experts support the view that home-grown is not more durable than Norwegian timber, and cannot be creosoted to the same advantage.

Composition of Royal Commission on Ancient Monuments.

Major Anstruther-Gray asked the Prime Minister whether he was aware that while societies, such as the Royal Archæological Institute, the Royal Institute of British Architects, and the British Archæological Association were formally invited to submit names to serve on the English Historical Monuments Commission, no such invitation was sent to the Society of Antiquaries of London. Mr. Asquith, in reply, said:—"As I was unaware who among the members of the societies referred to by the hon. member was best suited to assist on the Royal Commission on Ancient Monuments, I invited those societies to submit names to me. The prominent position of the Society of Antiquaries made it necessary for me to follow the same course in their case, and, in accordance with usual practice, I used my own discretion in the selection of members from the body to serve on the Comsion. The fact that out of eleven members of the Commission five are Fellows of the Society of Antiquaries, one of them having been President of the Society for many years, should, to my mind, be sufficient proof that neither in intention nor in practice has the Society of Antiquaries been ignored.

Extension of the Law Courts.

Mr. Bowles again raised the question of building additional law courts at an estimated cost of £95,000 on the open space at the western side of the existing Law Courts, and the consequent destruction of the open space in consequence. He wanted to know what circumstances had arisen which rendered the immediate erection of the new buildings necessary.

Mr. Harcourt, who has frequently stated the determination of H.M. Board of Works to carry out the scheme referred to, replied that the necessity arose owing to the inadequate accommodation afforded by the existing Law Courts. The open space had always been reserved for the purpose of erecting additional Law Courts.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
The querist's name and address must always be given, not necessarily for publication.
Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Right to Erect Hoarding.

KINGSTON-ON-THAMES.—A. G. T. writes: "A is leaseholder of ground occupied by premises shown on sketch plan (not reproduced). He is also owner of premises 1, 2, 3, etc. B is tenant, and has recently acquired the leasehold of corner premises. He has since erected the advertisement hoarding shown. Can A, by virtue of being ground landlord, legally compel B to remove this hoarding, or must he prove that light to rear windows of premises has been interfered with?"

The question is unfortunately not very clearly put, but I conclude that the premises marked "1, 2, and 3" are held by A *as leaseholder* (under another and superior landlord, who owns the freehold), and that A lets all three of the premises to B at rack rental. B has acquired the lease of the adjoining premises X, and holds them quite independently of A. If this be a true statement of the case, it follows that B holds two quite distinct properties, and each must therefore be dealt with as though belonging to, and as occupied by, two different persons; and it will be necessary to prove a substantial loss of light to the windows of premises No. 1, before the hoarding can be removed. The only other chance A has of remedying the nuisance is to appeal to the freeholder (if all the properties should happen to belong to one man); and even he cannot deal with it, unless the terms of the lease are violated by the erection of the advertisement hoarding. F.S.I.

KENT.—BROBEAT writes: "Please favour we with particulars as to climate, cost of living, etc., in the Argentine."

Salaries in the Argentine Republic are, we are given to understand, equal in purchasing power to about two-thirds of the same amount here. The extra cost of living and house rent makes the difference. There are a very large number of British, particularly Scotch, people living in the Argentine, mostly professional men. We believe that the climate is good. At Rio de Janeiro there are occasionally epidemics of yellow fever; but since the advent of European engineers, the sanitary condition and equipment of the Argentine towns has been greatly improved. These are all the particulars we can furnish our correspondent with at the moment. Perhaps some of our Argentine readers will oblige in greater detail.

Duties of Estate Steward.

MANCHESTER.—CONSTANT writes:—"What are the qualifications and duties of an estate steward? Please indicate a course of study to enable one to take a situation in this capacity. What are the prospects?

This is a very wide question, because the management of landed estate covers the whole range of the control of property of every kind, and it refers as well to the highly-trained professional man as to the working farm bailiff. Narrowing the question to refer to the control of a small country property, the duties of a steward would include the management of land in hand, as well as the control of the men employed in the woods and other departments, and possibly the game and park-keepers, gardeners, etc., etc., the purchase and sale of supplies and of produce, and the hundred and one things that are always occurring round and about a house in the country. In addition a steward will probably have to deal with the tenants of the farms that are let, and to receive the rents and pay the outgoings, and to do the repairs and so forth—a position calling not only for business training, but also for great tact and discretion. The course of study depends a very great deal on the exact position that is required, but, speaking generally, the only way to learn is to become actually engaged in the work itself—in the higher grades it is usual for a learner to enter the office of someone managing estates, either as a pupil or as a clerk; and in the lower capacities, one must engage as an assistant farm bailiff or wood reeve, etc., working one's way up as occasion serves. The Surveyors' Institution is the highest professional body which undertakes this educational work, and the syllabus of examination may be obtained from the Secretary, at 12, Great George, Street Westminster, on payment of one shilling and sixpence. There is work for really good men in all grades, but unfortunately there are numbers of "misfits" in other callings engaged in crowding this calling also. F.S.I.

THE ARCHITECT'S BUREAU.

Standardising Manufacturers' Circulars.

At the Holborn Restaurant, on November 24th, an interesting selection of building specialities was inspected by the committee of the Architects' Technical Bureau. A new feature is being inaugurated by the bureau for the purpose of alleviating to some extent the difficulty experienced by architects endeavouring to keep in touch with manufacturers' circulars sent through the post. It is recognised that more than three parts of these are consigned to the waste-paper basket without perusal. This waste represents not only a dead loss of money to the manufacturers, but it also implies that articles of considerable interest to an architect are frequently passed over. Even in those cases where the architect endeavours to read all the matter placed before him, the entire want of standarisation in shape and size makes it almost impossible to keep it in any form handy for reference. His difficulty in coping with manufacturers' circulars is further increased by the absence of samples or models, and also by the tendency of manufacturers to express themselves somewhat too freely as to the merits of their goods.

The bureau is adopting a standard form of circular, and providing its subscribers with loose-page filing folios for the various trades, to aid classification. Manufacturers submit the proposed form of circular, and also a sample or model to the committee, and are in attendance to give explanations. Should it be considered of sufficient interest to an architect, the circular bearing the bureau badge is sent out to all the subscribers. The manufacturers supply the circulars, and defray the cost of the postage. Twelve articles were in this way passed by the committee, the circulars of which will shortly be despatched to the subscribers, together with the folios for filing purposes

The subjects passed are, briefly, as follows:—

1. *"Burmantoft's Marmo Terra Cotta."*—Manufacturers, Messrs. The Leeds Fireclay Co., 2 and 3, Norfolk Street, Strand. This is a terra-cotta faced with an impervous leadless glaze, giving an appearance akin to marble. It can be produced in a variety of colours, and lends itself especially, though not necessarily, to ornamental work, in which case a considerable saving in the case as against stone would be effected by its use. The material is described as practically imperishable, its impervious nature rendering it not liable to be affected by weather or atmospheric conditons.

2. *"The Honeycomb" Draughtless Inlet Ventilator.*—Messrs. Comyn, Ching and Co., Ltd., 54-58, Castle Street, Long Acre, are the manufacturers of this ventilator. It is claimed to be draughtless, hygenic, and cleansing, and is made in pottery ware, with cast-iron frame and rim, and can be obtained in various colours. The air is split into fragments on passing through the ventilator, and is directed upwards. The fitting is easily taken out for cleaning purposes.

3. *"Moule's Earth Closet."*—Manufacturers, Messrs. Moule's Patent Earth Closet Co., Ltd., 5a, Garrick Street, W.C. This fitting is now made in thirty different forms, suited to various classes of users and the exigencies of position and required cost. They can be placed wherever a closet is desired. Absolute sanitation is claimed even where a water supply cannot be had, or where no drains exist.

4. *Silent Electric Clocks.*—Maker, Mr. G. B. Bowell, Terminus Chambers, Holborn Viaduct, E.C. This system is suitable for any building having a large number of rooms where uniform and correct time is desired, and is said to be the only make of electric clocks where complete silence is obtained in the movements. The system, we understand, has been installed in the Piccadilly Hotel (amongst other buildings) with 300 dials.

5. *The "Guild" Gas Stove.*—Manufactured by Messrs. the Birmingham Guild of Handicraft, Ltd., 7, Newman Street, W. It is a small, convenient fitting, in bronze or iron, of artistic design. It stands 16½in. high by 12in. wide, and is especially suitable for bedrooms, studios, or small rooms, where an occasional fire is required.

6. *Solignum Wood Preserving Stain.*—Messrs. Major and Co., Ltd., of Hull, supply this stain in a variety of colours. It is stated to be a sure preventive of decay, dry-rot, or fungoid growths in wood, and also renders stone or brickwork waterproof.

7. *Breeze Partition Blocks.*—Makers, Messrs. S. and E. Collier, Ltd., Reading. These blocks are suitable for partition walls, are light, easily fixed, and will hold nails, and are economical in construction.

8. *Patent Interchangeable Key Lock.*—Messrs. the Ratner Safe Co., Ltd., 51, Moorgate Street, E.C. This is a lock with nine levers so arranged as to change automatically the combination on being operated by a new key, said to be absolutely unpickable and secure. Many thousands of keys can be made to this lock, all differing, and any one of these keys will lock it, but no key except the one in use will unlock it.

9. *Luxfer Fire-Resisting Glass.*—Manufactured by Messrs. the British Luxfer Prism Syndicate, Ltd., 16, Hill Street, Finsbury, E.C. This system of glazing, consisting of plates of small squares of polished plate or other glass, ¼in. thick, is glazed in copper ribbon cames, and the plate made up in a metal channel frame. It is accepted by the L.C.C. where fire-resisting glass is required, will resist over 1,500deg. F., and is very strong and firm.

10. *Free Flow Drain Pipe.*—Messrs. John Knowles and Co., 38, King's Road, St. Pancras. These drain pipes are formed with a double rebated socket, which preserves the true alignment of the pipes when laid.

11.—*"Marmocrete."*—Manufactured by Messrs. Arthur Lee and Bros., Ltd., Hayes, Middlesex. This is a patent system under which building blocks are made of concrete with an outer casing of hard material, such as marble. The casing is made with dovetail grooves, which ensure a perfect key with the inner mass of concrete. Considerable economy in cost, especially in situations where iron girders play an important part in construction, will be effected, as the wall veil can be made to fit round stanchions without waste of material or cost of cutting stone.

12. *"Fluate."*—Supplied by Messrs. the Bath Stone Firms, Ltd., Bath. "Fluate" is a clear, colourless liquid, which is applied to building stones, marbles, bricks, etc., for the purpose of waterproofing and preserving. The effect is permanent, and does not require periodical renewal.

The "Edwardian" chimney pot is to be fitted to all chimneys at the New General Hospital, Ramsgate, the London Hospital Convalescent Home at Walton-on-the-Naze; and is to be substituted for the existing pots at the Hydro, Skegness.

Proposed New Works.

Aberystwyth.—The sanction of the Local Government Board to a loan of £3,000 having been obtained, it has been decided to invite tenders for the erection of eighteen houses for workmen, in Skinner Street and Poplar Row.

Blackrock, Co. Dublin.—Blackrock U.D.C. has given notice of a large improvement scheme involving demolition and reconstruction in the following areas: Temple Road and Sweetman's Avenue, 32 houses; courts off Sweetman's Avenue, 53 houses, and other houses adjoining; and 16 houses and premises in George's Avenue, and court off same.

Bootle.—A scheme for the erection of from twenty-four to thirty-six working-class dwellings to cost £7,000, has been passed by the Town Council.

Carlow.—Resolutions have been passed, at an influential meeting, in favour of constructing of line of railway from Castlecomer to Carlow, to open up the colliery districts of the Queen's County. A strong committee was formed and a guarantee fund opened and subscribed to for the furtherance of the project.

Dublin.—The paving committee of the Dublin Corporation are arranging for a loan of £100,000, for paving and repairs in the city.

Hull.—Mr. H. R. Hooper, an inspector for the Local Government Board, has concluded an enquiry with respect to the application for sanction to a loan of £24,000 for electricity undertakings, and to another, of £73,550, for the completion of the scheme for rebuilding and extending the town hall.

Inverurie.—For a new post office to be built here, the design by Mr. G. Bennett Mitchell, of Aberdeen shows a building of granite, with polished facings.

London, S.E.—The sorting office at the South-Eastern District Post Office is to be carried out at once, at a cost of £1,100.

Liverpool.—The City Council has passed a scheme for the formation of an athletic ground or "city stadium" on the Edge Lane estate. The stadium, as planned by the city surveyor, is to be 670 ft. long and 370 ft. wide. The total cost is estimated at £50,000, and is made up of £18,000 for the land, £7,000 for excavation, and £25,000 for the structure. "Twenty-three years ago," said the chairman in submitting a report on the scheme, "the Corporation spent £9,000 on filling-in the ground, and now it was proposed to spend £7,000 in excavating it again."

Rastrick, Yorks.—The Bishop of Wakefield's scheme for church re-organisation includes the division of the parish of Rastrick, and the erection of a church for the St. John's portion of the parish, with a new church on a site already secured near Brighouse railway station.

Stourbridge.—The Urban District Council have decided to apply to the Local Government Board for sanction to a loan of £3,700 for street improvements in Stourbridge

Scorton, Yorks.—The work of rebuilding of the House of St. John of God, is to be put in hand early in the new year. The cost is estimated at £10,000.

Totnes.—The Town Council is considering the desirability of erecting a town hall.

Walker-on-Tyne.—At a special meeting of the Estate and Property Committee of Newcastle Corporation, on Nov. 17, it was decided to make an survey of land at Walker, on which it is proposed to make two new roads, at an estimated cost of several thousand pounds.

Some New London Buildings.

The Building Act Committee of the London County Council recommended the Council, at its meeting on Tuesday last, to consent to the following works:—

Consent to an excess of openings on the Oxford Street and Duke Street and Somerset Street frontages of a building to be erected upon a site abutting upon Oxford Street, Duke Street and Somerset Street, St. Marylebone; to the erection of such building to the height, to the lines and with a projecting cornice, as shown on the plans, dated 6th June, 1907, submitted with the application of Mr. R. F. Atkinson, on behalf of Selfridge and Waring, Ltd.

Erection of a building on the south-eastern side of Orchard Place, Poplar, and erection of a boundary wall at less than the prescribed distance from the centre of the roadway of Trinity Road, as shown on the plan, dated 12th October, 1908, submitted in connection with the application of Messrs. W. Dunn and R. Watson, on behalf of Messrs. Donald Currie and Co.

Erection of buildings abutting upon Azenby Road, Camberwell, to the lines shown on the plan, dated 13th November, 1908, submitted with the application of Messrs. Deakin and Cameron, on behalf of Mr. G. H. Stelling.

Erection of wooden bay-windows, porches and barge-boards to twenty houses on the southern side of Wendell Road, Hammersmith, between Rylett Crescent and Hartswood Road, and three houses on the western side of Rylett Crescent, as shown on the plans, submitted with the application of Mr. F. E. Rosser on behalf of Mr. W. Binfield.

Erection of a building on the northern side of Hanover Square, Westminster, to abut also upon the eastern side of Harewood Place, with Oriel windows, balconies and bay-windows, as shown on the plans, dated 10th November, 1908, submitted with the application of Mr. G. D. Martin.

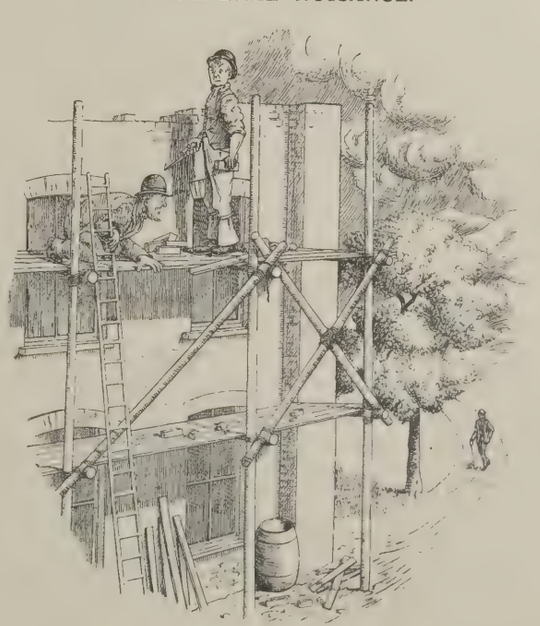
Views and Reviews.

Structural Design.

This book is a very valuable one for giving data upon many aspects of the determination of stresses in various parts of structures. Unfortunately the majority of books on applied mechanics do not deal with the architectural or civil engineering side of practice. Mr. Andrews has kept this aspect before him first and foremost, and he has tackled many of the difficult problems that arise in practice, and dealt with them on a thoroughly theoretical basis. Many of the little difficulties that we find glossed over or entirely avoided in the majority of books are here dealt with at length, and the book will undoubtedly be of great value to all those who study it carefully. Mr. Andrews, however, deals with each problem so liberally, often resorting to higher mathematics, that, for many engineers in practice, we are afraid the book is not quite arranged in a manner to be of the greatest service to them. In offering this criticism we do not wish to decry the great value of the work which Mr. Andrews has performed; we feel that he has done great service; but we wish that that service could be more appreciated by the architectural and engineering profession. The book, in its present form, is a little too theoretical, if we may so call it. It has not quite sufficient practical or commercial value. Another point, too, although apparently a smaller one, lowers its value, namely, the fact that the illustrations are not drawn and lettered so clearly as we are accustomed to expect in books on engineering theory. The book, just issued by Prof. Morley, is much better in this respect, though even in that work the lettering is not so clear as it is in many American books. A standardised form of lettering seems to be current in the United States, and unfortunately our authors do not pay sufficient attention to such little details. A crude diagram is very difficult to interpret; spidery lettering is not clearly read, and clearness of expression and economy of time are not to be lightly disregarded by an author. The problem may appear very clear to him, but these little set-backs weary the reader. However, the book is extremely cheap, considering its large size. Reinforced concrete, as well as steelwork, is dealt with, though it is treated rather in a summary fashion. The practical aspect of modern structural steelwork in buildings—i.e., as applied to the steel-frame building, is illustrated by photographs and drawings of recently executed works, several of the illustrations being borrowed from this journal. A special feature is made of dealing with problems by graphic construction, as many engineers have not grasped the principles of the infinitesimal calculus, and even for those that understand that method of mathematical reasoning, graphical construction leads to a very clear realisation of the nature of many problems, and a better understanding than would be obtained from a higher mathematical treatment. We may, in this connection, draw the attention of authors of engineering text-books to the great clearness which can be obtained by the drawings of stress strain diagrams in isometrical or geometrical projection. By these means the geometrical nature of moment of inertia can be shown and grasped more obviously. By Mr. Andrews' elaborate treatment we see that clearly there are certain aspects in the modern theory of subjects which raise grave doubts as to its fitting in sufficiently accurately with actual conditions. Also many deficiencies in regard to information on important points become noticable; for instance, the strength of slabs or plates, shear stresses and beams.

"The Theory and Design of Structures," by Ewart S. Andrews, B.Sc.Eng. (Lond.). London: Chapman and Hall, Ltd., 9s. net.

Weighty Work on Cranes.



Such a colossal monograph as Böttcher and Tolhausen on Cranes could only have been produced, one may suppose, by German thoroughness, industry and patience. It contains 510 pages, and its mere bulk emphasises the utility of cranes. Doubtless it deals with the subject most scientifically and most exhaustively, and is a work that most engineers and contractors, and some few architects, will find of inestimable service. The chief author, Herr Anton Böttcher, enjoyed exceptional opportunities for investigation. When the Stettiner-Vulcan workshops were converted to electric driving, the firm carried out the rebuilding of a large number of cranes of different systems, and a close examination of the construction and particulars of working, down to the smallest detail, and therefore, provided a rich fund of experience, of which Herr Böttcher appears to have availed himself to the fullest possible extent. But he extended his investigations much further afield. In the summer of 1902, he tells us. he "took a holiday," visiting the principal seaports and industrial centres to gather information; which strikes us as being a distinctively German idea of a holiday. English, American, and Continental practice are dealt with by the translator, Mr. A. Tolhausen. No phase of the subject seems to have been neglected, and the result is a truly monumental work, for which engineers will doubtless be grateful. Plates, diagrams, tables, a bibliography of important articles and papers on cranes, and a full index enhance the value of a work that reflects great credit on publishers as well as authors.

Cranes: Their Construction, Mechanical Equipment and Working. By Anton Bottcher. Translated and supplemented with English, American, and Continental Practice by A. Tolhausen, C.E. London: Archibald Constable and Co., Ltd., 10, Orange Street, Leicester Square. Price 42s. net.

The Heating of Habitations.

As M. Debesson remarks in his introduction to this stout volume, although heating and ventilation are among the most important of the problems that the architect and the engineer are called upon to solve in collaboration, and although from the remotest times man has felt the necessity for artificial heating, nevertheless, it was not until the middle of the eighteenth century that these vital needs were treated at all scientifically. Until then the means of supplying warmth had remained barbarously primitive. Nowadays we are perhaps nearing the opsite extreme; for means or systems of heating, as the 711 diagrams and 670 pages of descriptive matter in this book attest, exist in almost bewildering variety. There is therefore the greater need for such guidance as M. Debesson affords as to principles, systems, and details. The book contains thirty-one chapters, of which only the last is concerned with ventilation, which is dealt with in a gossiping and superficial manner. There are, however, a few general observations on the subject in the "preliminary notions" that occupy Chapter I. These notions strike one as being somewhat elementary. Take, for example, the following passages: "In 1789, Lavoisier wrote: 'Respiration is simply a slow combustion of carbon and hydrogen, entirely similar to that which occurs in a burning candle or in a lighted lamp; and, from this point of view, animals are veritable combustible bodies, which burn and are self-consumed.'" To this the author rather superfluously adds, "In respiration, as in combustion, it is

THE GENERAL NUISANCE.

First Workman to second ditto: "'Ullo, 'ere's the Architect a-coming. Let's 'eave a brick at 'im."

the atmospheric air that supplies the oxygen; but, as it is the organic substance itself that is the combustible material, therefore, if animals did not, by absorbing aliment, habitually feed the vital flame, it would die out like that of a lamp that lacked oil." It is a pity to burden so good and useful a book with such crude commonplaces of the elementary school. Then, again, in the "History of Heating," which forms the subject of the second chapter, the perhaps appropriately primitive pictures showing how primitive man kindled his sticks to set his pot a-boiling could well have been spared. These and other superfluities, however, may be indulgently regarded as evidence of the author's desire for thoroughness. Chapters III. to VII. deal mainly with the theoretical physics of heating, and except that Chapter V. contains a collection of formulæ, it is not until the eighth chapter that the author really settles down to practical work. Here his remarks on the construction of chimneys and fireplaces may be read with attention, if not always with profit. Thenceforward the book becomes more pertinent to practice, and affords, it may be supposed, a very complete account, which is at all events very copiously illustrated, of what is being done in France in the heating of buildings, whether by grate or stove or steam, by high-pressure or low-pressure, by gas or by electricity, by petrol or by alcohol. M. Debesson seems to be very well acquainted with what has been done by his predecessors in the same field, but he has not always got their names exactly right. We note, for instance, "Farenheit," "Frédérick Dye," and "l'Anglais Trégold." The book would gain greatly by compression, and by the rigorous rejection of every item of which the practical value is not obvious and indubitable. It is too comprehensive and diffuse for the heating specialist, but it may well serve the purpose of the architect who desires an all-round general collection of principles and practice in the various systems of heating.

Le Chauffage des Habitations. Etude théorique et pratique des Procédés et Appareils employés pour le Chauffage des Edifices, des Maisons des Appartements. Par G. Debesson. Ouvrage contenant 711 figures intercalées dans le texte. Paris: H. Dunod et E. Pinat, éditeurs, 49, Quai des Grands-Augustins. 25 francs.

Cobham, Salop.—At a special meeting of Shrewsbury Town Council, it was agreed to accept the tender (£6,883) of Messrs. Treasure and Son, of Shrewsbury, for the erection of proposed new elementary schools in Cobham, and to make application to the Local Government Board for permission to borrow £10,633 in order to push forward public works in view of the present distress from unemployment.

Bankruptcies.

Ashforth, Geo. Hy., builder, 79, Scott Road, Pitsmoor, Sheffield. Adj., Nov. 26.

Broadhead, Jas. Wilson, builder and contractor, Westfield Terrace, Tanshelf Drive, Pontefract, late Featherstone. First meeting, O.R.'s, Wakefield, Dec. 7. P.E., C.C., same, Jan. 14, at 11.

Cayton, Thos., and Geo. Johnstone Cayton (trading as T. Cayton and Son), painters, decorators, and plumbers, 58, late 40 and 13a, Kensington Road, Southport. First meeting, O.R.'s, Liverpool, Dec. 10, at 2.30. P.E., C.C., same, Dec. 14, at 11.

Edwards, Thos., plumber and decorator, Newbury, Gillingham. First meeting, O.R.'s, Salisbury, Dec. 8. P.E., Council House, Salisbury, Dec. 10, at 2.

Hall, Saml., and Herbert Wignall (trading as Hall and Wignall), builders, 11, Boundary Street, Lostock Graham, Northwich, late 10, Clarence Road, Birkdale, and on the Shore, Southport (the said Herbert Wignall, also trading as Edwd. Clarke, on the Shore, Southport). First meeting, O.R.'s, Liverpool, Dec. 8. P.E., C.C., same, Dec. 21, at 11.

Hodgkinson, Rchd., plumber and decorator, 25, Kenworthy Street, and Kay's Yard, off Kenworthy Street, late 37, Grosvenor Street, all Stalybridge. First meeting, O.R.'s, Manchester, Dec. 9, at 2.30. P.E., Town Hall, Ashton-under-Lyne, Dec. 17, at 12. R.O., Nov. 25. Adj., same day.

Hope, H., builder, Holly House, Farnborough Road, Farnborough. R.O., Nov. 21. First meeting, 132, York Road, S.E., Dec. 7. P.E., Town Hall, Guildford, Dec. 8.

Moore, Ralph Edwd., painter and decorator, 4, Ferndale Avenue, late 147 and 149, High Street East, and Eden Street, Wallsend. First meeting, O.R.'s, Newcastle-upon-Tyne, Dec. 9, at 12. P.E., C.C., same, Jan. 14, at 11. R.O., Nov. 25. Adj., same day.

Osborne, Hy. Jno. (described in R.O. as Osborne and Co.), builder and contractor, Hammond Road, Southall, late Briardale Road, Wavertree, Liverpool. Adj., Nov. 21.

Pillar, Herbert Stanley, builder, late Poplar Cottage, West End Lane, Pinner, and 8, Ross Parade, Ross Road, Wallington. First meeting, 14, Bedford Row, W.C., Dec. 9, at 12. P.E., C.C., St. Albans, Dec. 15, at 10.30.

Reed, Fredk. Hy., architect and surveyor, 9, John Street, Adelphi. R.O., Nov. 25. First meeting, Bankruptcy Court, Dec. 9, at 11. P.E., same place, Jan. 29, at 11.30.

Rhodes, Geo. Thos., builder, Lake Road, Portfield, Chichester. First meeting, O.R.'s, Brighton, Dec. 10, at 10.45. P.E., C.C., same, Dec. 10, at 11. R.O., Nov. 27, Adj., same day.

Seddon, Jas., sen., builder and contractor, 5, Clegg's Lane, Little Hulton. First meeting, 19, Exchange Street, Bolton, Dec. 8. P.E., C.C., same, Dec. 16, at 3. R.O., Nov. 24. Adj., same day.

Selby, Frank Anthony Smith, builder, Portland Road, Wyke Regis. First meeting, Crown Hotel, Weymouth, Dec. 7. P.E., County Hall, Dorchester, Dec. 18, at 12.30.

Sheppard, Thos., and Herbert Gordon Packham, builders and contractors (trading as Sheppard and Packham), 1, Quinton Street, Earlsfield the former residing at 27, Kyrle Road, Clapham Common, and the latter at 157, Brixton Hill, trading also as Humphrey and Turner, clothiers and outfitters, 573, Garratt Lane, Earlsfield. Adj., Nov. 27.

Staley, Wm., builder, 78, Brincliffe Edge Road, Sheffield. First meeting O.R.'s, Sheffield, Dec. 9, at 12.30. P.E., C.C., same, Dec. 17, at 2.

Stedman and Co., builders, 1 and 3, Shrewsbury Road, Romford Road, Forest Gate. R.O., Nov. 26. First meeting, Bankruptcy Court, London, Dec. 10, at 11. P.E., same place, Jan. 12, at 11.30.

Webb, Arthur Harry, builder, North View, New Street, Lutterworth. R.O., Nov. 26. First meeting, O.R.'s, Leicester, Dec. 9, at 3. P.E., The Castle, Leicester, Dec. 11, at 10.

Yeoman, Wm. Thos., painter and decorator, Perretts, Batson, near Salcombe. R.O., Nov. 28. Adj., same day.

Coming Events.

Thursday, December 10.

Edinburgh Architectural Association.—Prof. Charles Gourlay, A.R.I.B.A., on "Rheims Cathedral, and Some French Mediæval Churches," 8 p.m.

Friday, December 11.

Birmingham Architectural Association.—Mr. Edward S. Prior, F.R.I.B.A., on "English Parish Churches, chiefly of the Fifteenth Century."

Saturday, December 12.

Junior Institution of Engineers.—Visit to the Garage and Shops of the London General Omnibus Co., Black Horse Lane, Walthamstow, 3 p.m.

Saturday, December 12.

Northern Polytechnic Architectural and Building Students' Association.—Annual Dinner.

Monday, December 14.

Royal Institute of British Architects.—Mr. T. R. Spence on "The Elements of Design in Internal Decoration," 8 p.m.

Monday, December 14.

University of London.—Mr. Banister Fletcher, F.R.I.B.A., on "French Renaissance (and Modern) Architecture."—XI., 8 p.m.

Tuesday, December 15.

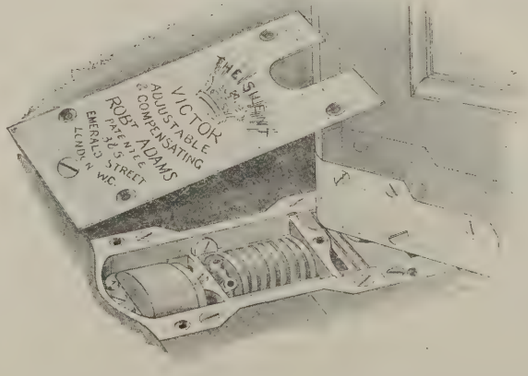
National Federation of Building Trades Employers.—Meeting of the Journal Committee, and of the Administrative Committee.

Wednesday, December 16.

Glasgow Institute of Architects.—Annual Dinner.

Northern Architectural Association.—Students' Meeting. Mr. H. A. Wilson, A.R.I.B.A., on "The Transitional Period," 7.30.

Hampton.—The Bishop of London has just consecrated a new church which Prebendary R. Digby Ram, vicar and rural dean of Hampton, has built to serve the out-lying part of his parish, known as Tangley Park, situated two miles from the parish church, where there is a large and rapidly growing population. The owners of the building estate gave the vicar the site 18 years ago, and it is now valued at £600. The architects, Messrs. F. H. Greenaway and J. E. Newberry, AA.R.I.B.A., of Queen Anne's Gate, Westminster, have designed a church which represents an attempt to carry on the traditions of English Gothic architecture, and at the same time to make the building express not only its purpose but its date. The portion of the church at present completed consists of the chancel, the side chapel, three bays of the nave, the north and south transepts, and one bay of the aisles, giving accommodation for 400 people, including the choir; and the sum spent on it to date is £4,000. When finished it will be two bays longer and will seat 638 people. The vicar has found the money to enrich the communion table with an inlay of ivory and ebony. The memorial stone was laid by Princess Christian on June 13th, and it is estimated that to complete the building will require another £3,000. Prebendary Ram recently completed 25 years' ministry at Hampton, and was presented with a large sum of money by his parishioners. This money he has devoted to the work of putting in the south aisle of the parish church fine new stone windows of delicate tracery from designs by Sir Arthur Blomfield and Sons.



Ellesmere Port.—For the erection of new council schools for Ellesmere Port and Whitby, sixteen tenders were submitted, ranging from £7,337 to £9,500. The former tender, which was submitted by Messrs. Duthie and Dobson, of Liverpool was accepted.

POINTS FROM THE FEDERATION, CENTRE, AND ASSOCIATION REPORTS.

The fair-wages clause in contracts has been the subject of special enquiry by the Secretary of the National Federation, who has collected information as to the forms in use by twenty-four London boroughs, and offers to place the information at the disposal of any association that may need it. The National form of contract has been formally introduced to the notice of the respective secretaries of the Builders' Institute and the R.I.B.A.

* * *

The Yorkshire Federation have had the pleasure of tendering to Councillor J. Birch, a member of the York Association, their felicitations on his having been unanimously elected Lord Mayor of York.

* * *

The Northern Counties Federation have agreed to draw up an appropriate form of sub-contract for members. The question of the direct tendering of electrical contractors has been under consideration, and a committee of this federation is prepared to meet a committee of the Electrical Association in order that the matter may be threshed out. Reference is also made to the correspondence in the "Builders' Journal" on the increasing employment by architects of specialist contractors.

* * *

The Midland Centre report considerable difficulties with respect to the question of area and radius.

* * *

The subject of the sub-contracting clause in the National form of contract has been very fully considered by the Bristol Association, whose views are to be placed before the National Federation.

* * *

The Plumbers' Committee of the Liverpool Association have succeeded in convincing the city water engineer that the water regulations should be altered, and a new code is to be drafted and submitted to the Association.

* * *

The Sheffield Association is able to report, in spite of the prevailing depression, a record amount of subscriptions and levies—£66 8s. 10d. more than for the whole of 1906, and nearly £30 in advance of last year. This success is partly attributable to the persuasiveness of the inter-trading rule, and partly to the personal magnetism of an exceedingly able secretary.

* * *

Sunderland and District Association, in view of the distress in the town, will not this year hold the usual annual dinner, but are looking forward instead to a summer excursion. The Barrow-in-Furness Association has also resolved not to hold the dinner this year, and instead will send a donation of £10 to the Mayor's distress fund.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

Model Rules.

Following the wish of the Conference of Secretaries, the amendments suggested during debate have been made, and a copy of the rules as amended has been sent to each Federation secretary for consideration and report.

Several have replied approving of the rules as amended. The report will, if possible, be printed and presented to the next meeting of the Administrative Committee, and after approval by the Committee circulated among the associations.

Model Rules for a Federation

have been drafted, and are at present under consideration by one of the Federation secretaries. They will be submitted to each in turn.

Circulars to Federations.

Circulars relating to the Local Government Board inquiry on the use of intercepting trape, and on matters connected with the Journal, have been issued.

Fair Wages Clause in Contracts.

The Oldham Association, having this question under consideration, and having requested information as to the form of clause used by the various London boroughs, these were written to, and 24 of them replied. The information will be available later on for any other association that may need it.

International Congress of Builders at Paris.

The secretary, accompanied by Mr. E. Archer, of the Northampton Association, attended this congress, and were well received. The proceedings were interesting, and it is a pity more representatives did not avail themselves of the opportunity. A full report has already appeared in the Journal. (See the issue for December 2nd.)

Birmingham.

The secretary attended the annual dinner of the Birmingham Association. The most interesting incident was the announcement by Mr. Whittal that the inter-trading rule has been adopted by this association. It is expected that in the near future this association will show a similar advance in numbers to what has taken place in every other place where this rule has been adopted and acted upon.

Form of Contract.

A number of reports have been received from the Federations and local associations giving the names of public bodies, etc., to whom it is desired that representations in favour of adopting the above form shall be made. The secretaries of the Builders' Institute and the R.I.B.A. have been interviewed, a suggested letter to the aforesaid public bodies submitted, and support asked for. Further action will be taken immediately after the Administrative Committee meeting.

Conciliation Board.

The National Board has considered appeals from Manchester re joiners' demand, and from Leicester re dispute as to area in which the joiners, bricklayers, and labourers were interested. In the former case it was decided that the wages of Manchester joiners remain as at present, and that notice and counter-notice be withdrawn except as to clauses on which the parties are agreed. In the Leicester case, it was decided that the operatives' contention as to the area of Leicester was the correct one, and that a note should be added to the rules to make this clear for their unexpired time.

Meetings.

A meeting of the Journal Committee and of the Administrative Committee will be held on December 15th. The annual meetings will be held on January 26th and 27th, 1909. Secretaries are reminded that returns of elected members, resolutions for general meetings, particulars of demands and concessions for annual report, and nominations for National Board of Conciliation, should be sent in as soon as possible, and certainly by December 31st.—A. G. WHITE.

THE NORTHERN CENTRE OF THE NATIONAL FEDERATION

COMPOSED OF

The Lancashire, Cheshire and North Wales Federation, The Yorkshire Federation and The Northern Counties Federation.

Secretary: JAMES DENVER, Cromwell Buildings, Blackfriars Street, Manchester.

Northern Centre Conciliation Board.

The Northern Centre Conciliation Board met at the Employers' Boardroom, Blackfriars Street, Manchester, on Thursday afternoon, November 11th, to consider the appeals from the Manchester local board with reference to the joiners' overtime rule, and to decide a question that had arisen under the worked stone rule. The joiners' appeal was the first considered, the local operatives desiring a rule whereby employers would not be permitted to work overtime, except in cases of absolute necessity, such as breakdowns, etc. The evidence given by the operatives in support of their case was, that they were desirous of such a rule being adopted with a view to finding work for some of those unemployed. The local employers, in explaining their case, stated that it was impossible for them to agree to a rule placing such a restriction on overtime. The matter was given full consideration, and the board, after taking a ballot, decided that the rule should remain as present, with the addition of a clause for the employment of "night shifts," whenever found practicable, the men thus employed to receive 1d. per hour above the standard rate of wages. It was also decided to extend the discharge notice for joiners employed on outside jobs from one to two hours; for those employed inside, the shops to remain at one hour.

The appeal of the operative stonemasons was to decide whether the job of an Atherton firm of contractors was in the Manchester or in the Oldham district, and as the exact position of the job could not be pointed out on several maps produced, the chairman (employer) and vice-chairman (operative) were appointed to ascertain by surveying the district whether the job was in or out of the Manchester area, and the meeting terminated.

The court appointed met and surveyed the district the following day, together with the employers' secretary, a representative of the firm and of the local operatives' society, and declared the job to be outside the Manchester district, and the decision was given in the employers' favour.

THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION

Secretary: JOHN TOMLISON, Cromwell Buildings, Blackfriars Street, Manchester.

The monthly meeting of the Administrative Committee of the Lancashire, Cheshire and North Wales Federation was held in the Boardroom, Manchester, on Friday, November 13th, at 2.30 p.m., the president (Mr. William Bullen) being in the chair. Thirteen representatives were present.

Communications were received and considered from the National secretary with reference to the Census of Production Act, and the Building Operations and Engineering Works Bill, and resolutions were passed thereon.

A lengthy discussion took place on the question of architects, Government departments, and large firms seeking to obtain tenders without supplying quantities, contrary to the usual practice in most towns in this district, and it was decided that, failing satisfactory assurances from the Government officials, the employers' Parliamentary Council should be approached in the endeavour to have the question raised in Parliament with a view to getting the practice discontinued so far, at least, as Government work is concerned.

A sub-committee was appointed to consider the question of "Architects and the Employment of Specialists," and no doubt their report will appear in these pages shortly.

The proposals of the Northern Centre for alterations to the Conciliation Board rules were agreed to.

The question of corporation fair contracts clauses was under consideration, and the secretary was instructed to obtain copies of the clauses in force in all the principal towns in the country for consideration at the next meeting.

The quarterly meeting of the Plasterers' Trade Committee was held at the "Café Monico," Oldham, on Wednesday, November 25th, when several matters of trade interest were considered, including the question of the fixing and finishing of plaster and other partitions, and a small sub-committee was appointed to consider and report on this subject. After the close of the meeting, the representatives were entertained to tea by the local employers, to whom a vote of thanks was recorded for their hospitality.—JOHN TOMLISON.

LOCAL ASSOCIATIONS AFFILIATED TO THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION.

ACCRINGTON AND DISTRICT.

Organising Secretary: R. Hall.

A very representative meeting of employers in the building trade of Accrington and district was held at the Railway Hotel, Accrington, on Wednesday evening, December 2nd. The meeting had been called and was held under the auspices of the Organisation Department of the Lancashire, Cheshire, and North Wales Federation, and was attended by Mr. Wm. Bullen, president of the Federation, who addressed the meeting on the advantages and benefits to be derived from an Association. Mr. Tomlison, the general secretary of the Federation, and Mr. Robert Hall, organising secretary for the district to the Federation, also addressed the meeting.

Considerable discussion ensued as to the advisability of forming an association, the members, amongst whom may be mentioned Mr. Jas. Waddington (who was appointed chairman for the evening), Mr. H. Ramsbottom, Mr. Richard Nuttall, Mr. R. Stewart, Mr. J. Cowell, Mr. J. Douthwaite, Messrs. Foden Bros., and Messrs. J. Berry and Sons, together with the rest of the employers present, expressed themselves unanimously in favour of forming an association.

It was then decided to appoint a committee of one representative from each branch of the building trade, together with Mr. Waddington as chairman, to draw up the rules and regulations, and issue summons for a general meeting for the purpose of adopting the rules, and for the election of officers to carry on the work of the association.

The chairman and committee fixed Wednesday, December 16th, as the date on which to hold their first meeting, the organising secretary promising to supply Mr. Waddington, the chairman, with copies of various rules belonging to other local associations.

On behalf of those attending, the chairman expressed his thanks to the president of the Federation, the two secretaries and all those who had helped to bring together so many employers in the building trade of Accrington and District, and hoped his expression of thanks would be communicated by the general secretary to the president and members of the executive of the Federation.

ALTRINCHAM, SALE & DISTRICT ASSOCIATION.

Secretary: W. Moody.

The ordinary monthly meeting of the Altrincham, Sale, and District Association, was held on the afternoon of Thursday, November 26th, the date of meeting having been altered to suit the arrangements of the Lancashire, Cheshire, and North Wales Federation.

The committee are supporting the action of the Federation in giving notice to the joiners, plasterers, and stonemasons for alterations to the working rules. They are also in favour of the proposed Board of Trade Court of Arbitration, provided the building trade is more adequately represented in the employers' panel.

The proposed alterations to the rules of the National Conciliation Board have the approval of the committee, who, however, think that the proposed majority of three cross votes, as defined in rule 13, will be difficult of attainment.

ASHTON-UNDER-LYNE, STALYBRIDGE, AND DISTRICT ASSOCIATION.

Secretary: G. H. Tonge, A.S.A.A.

The Ashton-under-Lyne Association has approved the scheme of proposed arbitration between sole and sub-contractors. The matter of the proposed Court of Arbitration to be formed by the Board of Trade has been discussed, but as it is understood that where trades federations have their own conciliation boards, the Board of Trade would not include them in their scheme, no action was taken.

Local builders report that there is no difficulty in getting architects to adopt the national form of contract. The Association approves of labourers being admitted to local conciliation boards, where rules are recognised and signed; but labourers should not sit on Centre and National Boards to adjudicate on cases from districts where their unions are not recognised. The proposals for amending rule 2 and rule 13 (made by the Lancashire, Cheshire and North Wales Federation) of the National Conciliation Board rules have been supported by resolution of the Executive.

Notice has been received from the Amalgamated Carpenters and Joiners for an increase in wages and alterations in working rules, and the matter is to be dealt with early in the new year. A deputation of the local master plumbers has met the association executive, and as a result it is very probable that a scheme will be completed for the admission of plumbers as members of the Builders' Association.

BARROW-IN-FURNESS ASSOCIATION.

Secretary: J. Baker.

At the November meeting of the association, it was resolved not to hold the annual dinner this year, owing to the prevailing distress in the town, but to send a donation of £10 to the Mayor's distress fund instead.

In order to meet with the views of the Lancashire, Cheshire, and North Wales Federation, *re* the simultaneous holding of monthly meetings of local associations, it was decided to change the

ROBERT HALL,

Building Surveyor,

52, Frederick Street, BURY.

With over 35 years practical experience of the Building Trade, and during the last 15 years a very varied experience in measuring up and adjusting contract and other accounts, is prepared to undertake and submit quotations for the following work:—

The Measuring-up and Adjustment of Accounts, Collection and Settlement of Accounts, Assistance given in Estimating, Annual or other Periodical Stocktakings, Private Enquiries and Arbitrations undertaken, or any other special work incidental to that a Builder or Contractor.

52, Frederick St., BURY.

J. B. JOHNSON & CO.,
FIBROUS PLASTERERS,
Crown Street, LIVERPOOL.

Contractors for the Thomson Scenic Railway, Franco-British Exhibition, Shepherd's Bush, the first and most successful side show on the field.

D. LORDEN,
Plasterer,
Plaster and Cement Merchant.
Worker in Fibrous Plaster &c,
Tom Brown Street, RUGBY.

Space in these Columns can be reserved for advertisements of Firms who wish their announcements to appear opposite any Association Report. Prices are as follows:—

	Per Insertion.
Per inch	6 0
13 insertions	5 0

Firms entitled to the benefits of the Intertrading Clauses with Associations are especially invited to send announcements for these columns.

date of the monthly meeting from the second Tuesday in the month to the fourth Tuesday. Matters relating to employers' liability insurance were also under consideration.

BLACKPOOL ASSOCIATION.
Secretary: W. A. Clarke.

Trade in the Blackpool district still keeps very slack, yet notice has been received from the operative carpenters and joiners demanding an increase of 1d. per hour; an increase in overtime pay; and various alterations to the present rules. After most careful consideration of these demands by the master carpenters and joiners, it has been decided to send in a counter-notice for a reduction of ½d. per hour, leaving the rules practically as they are at present.

The master slaters have formed a local association extending from Lytham to Fleetwood, and to be called "The Blackpool and District Branch of the Lancashire and Cheshire Federation of Slaters." The secretary pro. tem. is Mr. W. A Clarke.

BURY AND DISTRICT ASSOCIATION.
Secretary: R. Hall.

The monthly meeting of the Bury and District Association was held on Wednesday evening, November 25th, the president, Mr. John Inman, in the chair. There were also present eleven members of the committee, as well as Mr. J. E. Tinline (a past president), the past presidents of the association, under the new rules, being ex-officio members of the committee. The minutes of the previous meeting having been read and confirmed, the question of a Shipley firm of painting contractors who are doing work in the neighbourhood of Bury, and for a member of the Bury Association, was discussed at considerable length, it having been reported to the association that they were members of the Shipley Association for local purposes only. The matter having been taken up with the contractors by whom they are employed, it was reported that they had now joined the Federation.

The question of the proposed arbitration boards, as suggested by the President of the Local Government Board, was discussed.

A further question affecting the members of the association, with respect to the inter-trading rule, was that of members from outside districts coming into the town and giving tenders and doing work for people (employers in the trade under the new rules), who are not members of the Bury Association, and it was decided to approach the Federation on the matter, to see whether something could not be done.

The item of specialists, so often found in builders' quantities, was under discussion, and it was decided that a small committee, consisting of the president, Mr. Tinline, and the secretary, should draft a letter to be sent to the BUILDERS' JOURNAL in accordance with the request of the Federation.

Amongst matters under discussion by the committee was the issuing of a small pocket diary to members of the association, containing the new rules, as well as a list of members' names, their telephone numbers, and the whole of the operatives' rules. It was decided that the new rules, as adopted at the annual general meeting, together with a new list of members on a card suitable for hanging in an office, be issued as early as possible, and that one hundred copies of the pamphlet on "Municipal Trading," as issued by the Yorkshire Federation, be obtained and distributed amongst the members.

A general discussion followed respecting the arrangements for the annual dinner, after which the meeting terminated.

LIVERPOOL ASSOCIATION.
Secretary: Bertram B. Moss.

Referring to the report in the last issue relating to the notice given by the Liverpool Association to the operative bricklayers, it is now to be added that a counter-notice has been received from the operatives' societies giving notice for an increase in wages of 1½d. per hour, and several alterations to the rules.

The plumbers' committee have had a very satisfactory interview with the city water engineer, who, after discussing all the suggestions raised by this association with a view to altering the water regulations, admitted that the time has arrived when the water regulations should be altered, and is going to draft out a new code and submit same for consideration by this association.

MANCHESTER, SALFORD, AND DISTRICT ASSOCIATION.
Secretary: J. Tomlison.

It is pleasing to report that since the last Federation issue the re-organisation of the Manchester, Salford and District Association is progressing very favourably, and there is now no doubt that within a short time a strong general association will be established.

The half-yearly general meeting was held at the Boardroom, Blackfriars Street, on Thursday, November 12th, when the president (Mr. George Macfarlane) presided over a fairly large attendance of members.

The half-yearly report, which dealt with the re-organisation scheme, and the very disturbed relations with the operatives during the past six months, was adopted for circulation amongst the members.

Mr. William Tinker was nominated as a candidate for the National and Northern Centre Councils, in the place of Mr. Walter Marshall, who has signified his intention of retiring from business. Mr. H. Matthews, J.P., was also nominated for re-election. It was agreed to adopt the Federation's proposed arbitration rule between sole and sub-contractors

The Plasterers' and Painters' Branch of the association held their usual monthly meeting on December 1st; it was largely attended. Matters solely affecting their trade were chiefly the questions under discussion.

The Stonemasons' Branch also met on December 1st to consider counter-proposals received from the operatives to their notice for alterations in the present working rules; but as the proposals had been received after the date provided for in the rules, it was considered that they were not in order.

The questions of the Manchester joiners' wages and of the grinding and overtime rule have now been settled. The National Board have decided that the wages remain as at present, and the overtime rule was settled by the Northern Centre Board.

OLDHAM AND DISTRICT ASSOCIATION.
Secretaries: Cowper and Dean.

The number of members of the Oldham District Association to date is 180.

The Finance Committee of the Oldham Corporation, after considering the points raised by the deputation from the Oldham and District Association, have requested the master builders to confer with the Oldham Trades and Labour Council with a view to submitting a fair contracts clause which shall be mutually satisfactory to both parties, before the Oldham Corporation consider the final adoption of same.

The quarterly meeting of the Master Plasterers' Trade Committee of the Lancashire, Cheshire and North Wales Federation, was held at the "Monico Café," Oldham, on Wednesday evening, November 25th, when matters of interest to the trade were discussed. The representatives from various towns were afterwards entertained to tea by the Oldham Master Builders' Association. At the last monthly meeting, the proposed arbitration rule between sole and sub-contractor received approval.

The circular from the Board of Trade *re* the Arbitration Court was also considered, and the general outline of the scheme was duly approved. The best method of securing the general adoption of the National form of contract was considered, and the names and addresses of all the officials of public bodies in the town were sent to the National secretary, so that the latter might communicate with them on the subject.

The secretaries reported on the small number of returns of men and apprentices employed that had come in from members in response to a special appeal from the National Federation, and a further effort is to be made to secure the whole of these returns.

PRESTON ASSOCIATION.
Secretary: John Tomlison.

The Preston Association having opened their new offices and boardroom in Mount Street, just off Fishergate, Preston, it is proposed to hold the annual dinner in the new premises on December 16th, when the formal opening will take place.

WARRINGTON AND DISTRICT ASSOCIATION.
Secretary: Bertram B. Moss.

The Warrington Association have had under consideration the advisability of altering the joiners' rules, and at their last meeting decided to send a notice for a reduction in wages of ½d. per hour, and slight alterations to the rules. This notice has been sent.

WIGAN AND DISTRICT ASSOCIATION.
Secretary: R. Hollows.

A special meeting of the master joiners of the Wigan Association was held on November 10th, to consider the notice of alterations to working rules received from the operatives' society. After discussion, it was decided that a counter-notice be sent in to the following effect:—"That wages be reduced from 9d. per hour to 8½d.; that the working hours in the summer months remain as heretofore, but as regards the winter months they be made to coincide with those of the operative bricklayers, for inside as well as outside men."

A demand was made that the several starting places be increased, and that those stated in the operative bricklayers' rules be agreed upon. This will extend the boundary radius by more than half-a-mile. In addition to the extended boundary, the operatives were requested to grant "that should any employer require his men to travel by tram or train to a job within a 3½ miles radius, the workman shall, on payment of the fare by the employer, travel by the car or train leaving the terminus or station at the first time immediately preceding the starting time. With respect to the railway train, this clause to apply only to those starting within twenty minutes preceding the starting time."

The question of limitation of apprentices as demanded by the operatives was not entertained at all. With regard to the rule respecting piecework and the importation of prepared woodwork, this association has demanded that the present stringent rule be relaxed a little, and that whereas no imported woodwork is now allowed to come into the town from a greater distance than five miles, any prepared woodwork must be allowed to come in from any place in Lancashire where the rate of wages paid is not less than that paid in this district.

The operatives were also requested to grant that "should a Wigan master have a job exceeding 3½ miles from the Wigan Market Place, he shall be at liberty to start men on the job."

The date of the joint meeting of masters and men has not yet been fixed upon.

The annual meeting of the Association was held at the Clarence Hotel, Wallgate, Wigan, on Thursday, November 19th. Mr. Councillor Alfred Higham was in the chair, and about 22 other members were present. The secretary's report stated that the association still continued to prosper, and that the finances were in a healthy condition. Mr. William Webster (Messrs. Webster and Winstanley) was elected president for the ensuing year, and Mr. John Smith, vice-president. A copy of the pamphlet on "Municipal Works Departments," published by the Yorkshire Federation of Building Trade Employers, was ordered to be sent to all the borough officials, aldermen, and councillors, and also to the members of this association.

The policy of the Corporation undertaking the building of workmen's dwellings to provide work for unemployed workmen in the district was deprecated, and the matter is to be pressed further in the town council.

The annual dinner of the association was arranged to be held on Tuesday, December 8th (yesterday).

There is nothing to report from the Northern Centre, nor from the following associations affiliated to the Lancashire, Cheshire and North Wales Federation: Birkenhead and Wirrall, Bolton and Farnworth, Burnley, Chester, Crewe, Darwen, Heywood, Lancaster, Leigh, Llandudno, Longridge, Macclesfield, Middleton, Radcliffe, Rochdale, Rossendale, Southport, St. Anne's-on-Sea, St. Helens, Stockport, Wallasey.

THE YORKSHIRE FEDERATION.

Secretary: J. DAVIDSON, 14, Park Row, Leeds.

The monthly meeting of the executive council of the Yorkshire Federation was held at the King's Head Hotel, Barnsley, on Thursday, November 19th. Mr. J. Biggin (president), occupied the chair, and was supported by 40 delegates from the affiliated associations.

The minutes of the previous meeting were read and approved.

Alderman E. J. F. Rideal, Mayor of Barnsley, was present during a portion of the proceedings, and received a most cordial greeting. He welcomed the Federation to the town, and stated that they felt they were honoured in receiving them from time to time. He also referred to the cordial relationship subsisting between the corporation and the local builders.

The president, in a few appropriate words, drew the attention of the Federation to the fact that Councillor J. Birch, a member of the York Association, had been unanimously elected Lord Mayor of York. He had the greatest pleasure in moving that the Federation tender to Councillor J. Birch their sincere and appreciative congratulations on the distinguished honour conferred upon him; their earnest hope that he and the Lady Mayoress may be blessed with splendid health during their period of office, and their unbounded confidence that they will worthily uphold the best traditions of the office. The motion was seconded by Mr. G. Sharp, of York, and carried with acclamation.

Apologies for absence were reported from Alderman W. H. Jessop, J.P. (Huddersfield), Messrs. T. Lindley (Barnsley), T. E. Taylor (Bradford), E. Quibell (Hull), W. Irwin and P. Rhodes (Leeds), and A. W. Sinclair (Scarborough).

The treasurer reported receipt of subscriptions amounting to £10 14s.; and of transfer from Insurance fund of £20. The finance committee reported that they had examined the accounts and recommended payment. On the motion of Mr. A. J. Forsdike, seconded by Mr. W. R. Thompson, the accounts, amounting to £45 7s. 4d., having been certified as correct, were approved, and cheques were drawn in payment.

The resolution of the Northern Centre was read and considered, that the labourers' union be admitted into the Local Conciliation Board of any district, and, should a dispute arise which they cannot settle locally, that the Northern Centre Conciliation Board be recommended to consider any labourers' question that might be referred to them on condition that the parties making the appeal shall meet all expenses in connection therewith. It was reported that under this resolution any local association which has mutually adopted rules with the bricklayers' labourers governing rates of wages and conditions of labour is at liberty to exercise a discretionary power, in conjunction with the other parties to the Local Conciliation Board, as to the admission of the labourers as members of such board.

The president reported that the deputation appointed by the Federation had interviewed the West Riding architect and engineer with respect to the National form of contract, and hoped to be favoured with his reply at an early date. With respect to other matters, Mr. Edwards promised to give special atention to such points as arbitration, workmen's compensation insurance, early notification to contractors, prime cost sums, etc. On the motion of Mr. W. R. Thompson, seconded by Councillor J. Dawson, the best thanks of the Federation were tendered to the deputation for the excellent report they have given, and the valuable concessions they have been promised by the West Riding architect and engineer.

Reference frem the Conference of Yorkshire Secretaries and Representatives as to revision of Federation rules was considered. The secretary stated that Mr. White, the National secretary, was

preparing a model set of Federation rules, and it was hoped that these would be available for consideration in the course of a week or two.

At the recent conference, it was obvious that different customs were obtaining among the local associations with respect to Federation subscription for associate members. Some associations are paying 4/- for each associate member, while others are not paying anything for such members. It was resolved, on the motion of Mr. G. Rayner, seconded by Mr. G. Sharp, that the local associations be requested to kindly contribute 4/-, for each associate member for the year closing on November 30th, and that in future the amount payable to the Federation be 25 per cent. of the subscription paid to the local association.

The finance and emergency committee recommended that a further issue of the Directory should be made as early as possible in 1909. On the motion of Mr. A. J. Forsdike, seconded by Councillor J. Dawson, the recommendation of the committee was approved, and the secretaries of local associations were cordially invited to favour the Federation by their valued co-operation in furnishing lists of members and obtaining advertisements.

On the motion of Councillor J. Dawson, seconded by Mr. J. T. Levitt, the president, vice-presidents, treasurer, and secretary, were appointed an arbitration committee to consider any disputes or differences which may arise between members and which it is mutually agreed shall be referred to the determination of such committee.

It was reported that the Local Government Board had appointed a departmental committee to inquire and report on the use of intercepting traps in house drains, and the question was considered as to whether any evidence should be tendered by the building trade. The members of the Federation were of opinion that the matter should be dealt with in the first instance by the National Administrative Committee.

The alterations in the National Conciliation rules, of which notice had been given by the Northern Centre, were read and considered. The representatives of the Federation were requested, on the motion of Mr. W. R. Thompson, seconded by Mr. A. J. Forsdike, to support the adoption of the amendments both by the National Federation and also by the National Conciliation Board.

The chairman reported that the emergency committee had carefully considered a case with respect to the liability of one of their members who had been a sub-contractor on works completed some time ago. The matter was referred to the finance and emergency committee, with full power to take all necessary action as eventualities arise.

The recommendations of the emergency committee with respect to officers and committees for the ensuing year were considered, and nominations were made for consideration at the annual meeting.

The arrangements for the annual dinner were referred to the emergency committee with full power to add to their number.

Mr. T. Lee, president of the Wakefield Association, invited the Federation to hold the December meeting in that town. Mr. J. T. Levitt stated that the Hull Association were willing to postpone their invitation, and indeed preferred that the visit of the Federation to Hull should take place during the summer. On the motion of Mr. A. J. Forsdike, seconded by Councillor J. Dawson, it was resolved to accept the invitation to hold the next meeting at Wakefield, and Thursday, December 17th, was selected as the date.

The Council were afterwards entertained to tea by the president and members of the Barnsley Association, to whom a hearty vote of thanks was accorded for their generous hospitality.—J. DAVIDSON.

LOCAL ASSOCIATIONS AFFILIATED TO THE YORKSHIRE FEDERATION.

BARNSLEY ASSOCIATION.
Secretary: F. Denton.

The number of members of the Barnsley Association to date is 50.

The monthly meeting was held at the King's Head hotel, on Wednesday, November 11th, the president, Councillor G. Haigh, in the chair. There was an attendance of 16 members. The president was congratulated by the members of the Federation on his re-election to the town council. After the usual routine business, the secretary submitted his report of the Conference of Secretaries, held in London, and a hearty vote of thanks was accorded him for his attendance. The principal business of the evening was the election of officers for 1909, the result being as follows:—President, Councillor G. Haigh, re elected; senior and junior vice-presidents, Mr. E. Broley, and Mr. C. D. Potter, respectively re-elected; treasurer, Mr. H. Ashworth, re-elected; secretary, Mr. F. Denton, re-elected; delegates to National and Yorkshire Federation, Councillor G. Haigh and Mr. E. Broley. All the elections were unanimous. Mr. T. Lindley, the retiring delegate, has done yeoman service for several years past, but the increasing pressure of business claims prevented his standing for re-election.

The Yorkshire Federation were entertained by the Barnsley Branch on Thursday November 19th, before the meeting, to a visit to the local chrysanthemum show, and after the meeting, to a tea, at which the newly-elected Mayor and the ex-Mayor were both present.

BRADFORD ASSOCIATION.
Secretary: J. Davidson.

The monthly meeting of the Bradford Association was held on November 24th, and Mr. T. Taylor, the president, was supported by several members.

The minutes of the Yorkshire Federation were read and considered. The treasurer's account was presented, and several accounts were passed for payment. It was decided to hold the annual meeting on December 22nd, and nominations for officers and committees were received for consideration at the annual meeting.

DEWSBURY ASSOCIATION.
Secretary: E. B. Walmsley.

The number of members to date of the Dewsbury Association is 36.

The annual meeting was held on November 18th. The reports of the Yorkshire Federation meeting, and the conference of Local Secretaries recently held in Leeds were discussed. Mr. Sam Coop was again elected president of the Association.

The annual dinner took place on November 26th, and was well attended. In addition to the members, fifteen guests were present, amongst whom were Mr. Davidson (secretary to the Yorkshire Federation), Mr. Forsdike (treasurer), and the presidents of the Wakefield, Barnsley, Huddersfield, and Morley Associations.

LEEDS ASSOCIATION.
Secretary: J. Davidson.

The annual meeting of the Leeds Association was held on November 10th. Mr. Wm. Irwin was re-elected president for the ensuing year, and a most hearty vote of thanks was tendered to him for his valuable services as president during the past year. Mr. Osman Mawson was appointed vice-president. The auditors, Messrs. E. Umpleby and G. W. Nettleton, were thanked for their services, and re-appointed. The representatives to the Yorkshire Federation and the general committee were also re-appointed.

On the motion of the president, the association decided to order a copy of the BUILDERS' JOURNAL for the use of the secretary. A discussion took place as to the best means of enrolling merchants and manufacturers as members of the association.

It was reported that the directors of the Leeds Builders' Exchange, Ltd., were terminating their occupancy of the existing premises, by effluxion of time, on March 31, 1909.

A resolution of condolence and sympathy was carried to the relatives of the late Mr. John Ingleson, who, before his retirement from business, had been a member of the association.

The general committee considered a case in which an associate member had approached architects over the head of the contractors, for special works required for a contract which had been in progress for some little time. Without consulting the builder, the architect had accepted the tender, whereas the builder had already notified the specialists, when approached personally, that a tender had already been accepted by him for the work referred to. After explanations were given by the principal contractor and the firm concerned, the matter was settled to the satisfaction of the council by the firm undertaking, in view of the full explanation which had been made, to withdraw the tender which had been inadvertently accepted by the architect. The value of intervention of local associations in hearing differences between members was thus emphasised.

SHEFFIELD ASSOCIATION.
Secretary: T. Smith.

The monthly meeting of the Sheffield Association was held on November 12th, the president (Mr. Thos. Eshelby) in the chair. A letter was read from Sir Cecil Hertslet, British Consul at Antwerp, announcing the death of the Burgomaster at Antwerp, who had so cordially granted a civic reception to the members of the Sheffield and other Yorkshire associations who visited Belgium in August last. On receipt of the letter, the secretary, at the request of a few members of the association, had immediately written to Sir Cecil Hertslet requesting him, in the name of the association, to express their deepest sympathy and condolence in the proper quarter, and the sense of loss which must be felt so poignantly by the city of Antwerp, and more especially by the Master Builders' Association of Antwerp in losing a Mayor who was at one time one of their number, and up to the time of his death an honorary president of their association. Sir Cecil Hertslet had kindly done this, and forwarded a copy of the letter he had received from Mons. A. Hentogs, son of the late Mayor, a translation of which was read to the meeting.

With respect to the suggested preferential trading between builders' merchants and manufacturers, a letter was read from the secretary of the Builders' Merchants' Association asking what definite proposals (if any) the Builders' Association had to offer. To this the secretary had replied calling attention to a previous letter advising the appointment by the Builders' Association of a sub committee of five members to meet a sub-committee from the Merchants' Association to discuss and formulate a scheme for submission to both associations, and he now awaited a reply from the Merchants' Association as to the representatives they had appointed.

A discussion followed on the Workmen's Compensation Act, on a motion of Mr. H. H. Hodkin to the effect that the Act was working unsatisfactorily to both employers and employees, and requesting the Yorkshire Federation, through the National, to petition Parliament for a revision. The action of the insurance companies in making a dead set against insurance of workmen beyond certain ages was unnecessarily increasing the ranks of the unemployed, while, on the other hand, the Act had led to malingering, and was grossly unfair in regard to illegitimate dependents.

Mr. Biggin said the National were watching with interest the action of the Government in regard to compulsory State insurance, which would effectually remove the grievance. There was some talk of appointing a committee to bring in such a Bill, and he thought, therefore, Mr. Hodkin's motion could be deferred for a little while. Mr. Hodkin concurred, and the matter was allowed to drop.

The report of the meeting of the Conciliation Board, held the previous evening under the presidency of Mr. A. J. Forsdike, led to a lengthy discussion. At the meeting, the whole Board were represented, and there were also present the secretary of United Trades Committee of Carpenters and Joiners on the one side, and Mr. Chas. Boot (Messrs. Hy. Boot and Son) on the other. The matter arose out of the action of the Joiners Society in reporting an alleged breach of rules in regard to walking time on the part of Messrs. Boot and Son to the Sheffield Corporation, the result of which was that Messrs. Boot and Son had been fined £24, although the amount involved was only £1 7s. 5d. The association took exception to what they characterised as high-handed action on the part of the Joiners' Society, and pointed out that such action not only constituted a breach of Rule 2 of the Conciliation Board, but was in diametrical opposition to the joiners' working rules, which stipulated that in case of any alleged breach of rules the employees or their representatives should seek an interview with the employer, whereas in this case the matter was carried direct to the Corporation, not only without any intimation to the Conciliation Board, but without any intimation to the employers. A very lengthy correspondence had ensued, in which the operatives claimed that they were strictly within their rights in taking the action they had done, while, on the other hand, the Master Builders' Association claimed that it was a breach of the rules of the Conciliation Board, and that if the employees persisted in claiming that their action was correct the employers would refuse to act on the Conciliation Board, which must cease to exist if its prerogatives could be usurped at the will of a section of the operatives' side of the Board. The meeting was therefore called to consider the action taken in the matter by the U.T.C. of Carpenters and Joiners. Almost from the outset, the discussion became heated, and after two hours and a half spent in fruitless discussion, not the slightest progress had been made, and the meeting had every appearance of becoming abortive. The moment the first item on the agenda had been announced, the secretary of the operatives' section moved that, as the matter had not gone through the ordinary channel provided in Rule 2—that is, had not been discussed by the trade committee affected, it was therefore at the moment outside the jurisdiction of the Board. The operatives' section objected to the reading of the correspondence which had passed between the respective secretaries, and objected to the calling of the meeting and everything connected with it, which they claimed was out of order. This was naturally taken by the employers' section of the Board to be a move to burke discussion of the whole matter, and led the chairman to remark with some heat that the operatives had not come to discuss fairly a matter of the very gravest importance to the future conduct of the Board, about which the association felt most strongly, but merely to play a game of bluff. This remark raised a storm of words, and for the better part of two hours speeches more or less acrimonious followed from both sides in quick succession, and the whole matter which it was claimed by the blocking motion was out of order was actually discussed. Driven from their original stand, the operatives claimed that the matter was further out of order as the job was outside the area of jurisdiction of the Board, but this point was promptly disposed of by reference to the agreement, at a meeting in May of 1907, that matters outside the area should be considered. And so the discussion continued, with neither side prepared to concede a point towards agreement. At this juncture the employers' secretary pointed out that the motion that the matter on the agenda was out of order had no direct bearing on the purpose for which the meeting was called. He invited the operatives' chairman and secretary to read the item again, and they would then see that they were met to "consider the *action taken* by the Joiners' Society in reference to, etc." The operatives' motion was that the Board had no right to consider the case of Messrs. Boot, as it had not gone through the necessary preliminary channels. But he submitted they were not met to consider the case of Messrs. Boot's alleged breach of rules. The blocking motion had merely trailed the meeting along a false issue which was not on the agenda, and the item on the agenda was not at fault. What they were met to consider and adjudicate upon was the action taken by the Joiners' Society on their own initiative, without giving notice to the Board, and the employers claimed that no section of the Board had any right to take such action, and he asked again, as he had asked two or three times in the correspondence, if the operatives claimed the right to take similar action in any other case, irrespective of whether the job was one in which the City Council were the proprietors. As a matter of fact, a breach of rules had occurred on the job of another member since these negotiations commenced, and the same society who had taken the action complained of in this instance, promptly and very correctly brought the matter to the immediate notice of the association. Why had different action been taken in a job where the City Council were the proprietors? He held that the Conciliation

Board as a whole were the proper and *only* competent body to decide whether or not the action of a section of it, against whom a complaint was made, was justifiable. The merits or demerits of the case, although they had been discussed and were admittedly out of order at this meeting, was quite another question, which was not on the agenda. To this the operatives set up the plea of extenuating and justificatory circumstances in this special instance, but in reply it was pointed out that if the contractors broke the rules every day, that did not justify the operatives in taking action without the knowledge of the Board, which existed for the express purpose of settling any matter of dispute. Any resolution of the Board, said Mr. Biggin, did not preclude the operatives from subsequently bringing the matter to the notice of the Corporation; or if, as they claimed, their action in this particular instance was dictated by exceptional circumstances, no very great objection would have been taken to concurrent notification to the Conciliation Board and the City Council. They as employers did, however, claim as a right that if some matters were to be taken over the head of the Conciliation Board, the whole must be taken. He claimed that their demand for an explanation and an indication of the course to be taken in any similar case was of vital importance, and, to test the feeling of the meeting on the altered phase of the discussion, he moved that in future no action be taken against any member without notice being first given to the Master Builders' Association. After a few moments' private discussion in the operatives' section, Mr. Stone, of the Bricklayers' Society, seconded the motion, which was unanimously carried, and thus ended amicably a meeting which had threatened a serious rupture in the proceedings of the Board.

There is nothing to report from the following associations affiliated to the Yorkshire Federation: Barnoldswick, Bridlington, Grimsby, Halifax, Harrogate, Huddersfield, Hull, Malton, Morley, Scarborough, Shipley, York.

THE NORTHERN COUNTIES FEDERATION.

Secretary: W. H. HOPE, Solicitor, Post Office Chambers, 14, Norfolk Street, Sunderland.

Minutes of a meeting of the executive council of the Northern Counties Federation, held at Sunderland on Tuesday, November 24, 1908, at four o'clock in the afternon, when there were present: Messrs. Stephen Easten, R. Heslop (Newcastle-on-Tyne); John Proud (West Hartlepool); John Davison, W. C. Creasor (Stockton); John T. Scott, Joseph Pelton, John R. Hadaway (North Shields); W. S. Davison (Middlesbrough), J. More, Alex. Ross, W. J. Robertson (South Shields); John Simpson (Blyth); W. B. Cooper and R. J. Huntley (Sunderland).

The minutes of the executive council meeting held at Sunderland on August 11th, were read and signed by the president, Mr. Easten, as correct.

The secretary gave a report upon the negotiations with the Durham County Council. The buildings sub-committee have intimated that they will receive the deputation appointed at the last quarterly meeting at their next Committee Meeting in December on the Federation requirements in the form of contract.

A report upon the Conference of Secretaries held in London on October 20th was given by the secretary. Reports of the proceedings are being prepared by the National secretary for distribution.

The question of fixing the date of the annual meeting, which is to be held at Newcastle-on-Tyne within the first fourteen days of December, was discussed, and it was decided to leave the date in the hands of the president, who will confer with the Newcastle Association. It was mentioned that the annual dinner of the Tyne and Blyth District Federation would be held immediately after the annual meeting.

The financial statement was considered satisfactory, and accounts amounting to £97 17s. 4d. were passed for payment.

The question of the sub-contractors' position with respect to payment for their work, which had been referred to this Federation from the Teesside Association, was considered. It was stated that the sub-contractors did not receive payments as and when the contractors received their draws, even after the completion of the job and final certificate to the contractor of theirs. If the contractor assigns his retention money or becomes a bankrupt, the sub-contractor stands to lose very heavily indeed. The head contractor had security in the shape of his contract with the architect. The sub-contractor had no such guarantee, but depended entirely upon the contractor, which had caused considerable loss to the sub-contractors in that district. The president pointed out that these cases only occurred when the contract had been entered into with persons of no stability, and that perhaps a sub-contract could be drawn assuring payment to the sub-contractor in the same proportion as the head contractor received it from the architect, and at the same time. After a lengthy discussion, it was resolved, on the proposition of Mr. J. Proud, seconded by Mr. A. Ross: "That the secretary of the Federation be requested to have drawn up an appropriate form of sub-contract for the use of the members, and forward the same to the Teesside Association."

The president reported that, previous to the meeting, a deputation had been received from the Newcastle branch of the Electrical Contractors' Association, when the question of builders' commission was discussed. At the present time, architects invited the electrical contractors to tender direct, and in the majority of cases put the amount which was net as a p.c. sum into the builders' schedule. This very often led to friction among the parties concerned. The matter had been very carefully discussed, and it was proposed that a small committee from this Federation should be appointed to discuss the matter with a similar number of the Electrical Association, to decide upon the course of action to be pursued in approaching the architects, who are to be requested to meet the committees of the Federation and the Association to discuss the matter. The president moved the proposal, which was seconded by Mr. J. Pelton, and carried unanimously. On the proposition of Mr. A. Ross, seconded by Mr. R. Heslop, the following were appointed the committee: The president, W. T. Weir, J. W. White, and T. Wilkinson.

The question of the notice for the alteration of the working rules was discussed, as it is desirable when dealing with notices to or from the operatives for any alteration in the working rules, to endeavour to get a clause inserted in the rules so "That at least a fortnight shall be allowed to consider the same, and to send in a counter-notice." It is thought that the rule might do away with the necessity of either side giving to the other notice of alteration of rule, in anticipation of the other side doing likewise. If it is open to either side to give a counter-notice, neither side possibly would be the first to give notice, and hence none might be given, except in cases where a change of rule was really desirable. The associations within the Tyne and Blyth District have already this proviso inserted. The Teesside Association have no stipulated time for giving notice. As the Sunderland Association has stipulated times, it was decided to recommend to that Association the necessity of approaching the operatives to get this rule inserted.

The question of the operatives' wages, which recently received the attention of this Federation, has been before the Northern Centre Federation, who have also made inquiries of the associations within the centre; and as the feeling appeared to be against any reduction, it was decided to recommend that no action in the matter be taken.

The secretary drew attention to the fact that the Local Government Board had appointed a Departmental Commitee to enquire and report on the use of Intercepting Traps in house drains, and that the town clerks of the principal towns in England and Wales are to be asked to give evidence where necessary. It was thought that this enquiry would not trouble the members of this Federation, and that the matter should be dealt with in the first instance by the National Administrative Committee.

The National secretary has drafted a set of model rules for local associations, which were considered at the Conference of Secretaries, and, while they were generally deemed satisfactory, it appeared from the discussion that some slight amendments were desirable; and the consideration and final approval of these rules were left in the hands of the county and centre secretaries, prior to their being reported to the administrative committee.

The Northern Centre have given six months' notice for alterations to the National Conciliation Board rules, rules 2 and 13, and also for new rules dealing with "period for which a decision shall endure," and "Private consultation at Board meetings."

Reference was made to the correspondence in the BUILDERS' JOURNAL in reference to the increasing employment by architects of specialists for executing joinery fittings and other work. It was mentioned that the Lancashire and Cheshire Federation were dealing with the replies thereto. No action was recommended to be taken by this Federation.—W. H. HOPE.

LOCAL ASSOCIATIONS AFFILIATED TO THE NORTHERN COUNTIES FEDERATION.

HARTLEPOOLS ASSOCIATION.
Secretary: E. Moody.

The annual meeting of the Hartlepools Association was held on Monday evening, November 30th, in the Oddfellows' Hall, York Road, West Hartlepool, Mr. W. M. Thompson (president) in the chair. There was an exceedingly good attendance of members.

In presenting his report and balance sheet, the secretary pointed out that although the balance in hand had not increased to the same extent as in former years, the fact of the year's working showing a profit at all must be considered gratifying, bearing in mind the present very unsatisfactory state of the building trade, and the fact of closing up the accounts at the end of November, to allow of the various association and Federation meetings to be held in December, to comply with the new rules of the National, and further, the decision to allow the greater portion of the commission on workmen's compensation insurance premium direct to the insurers instead of crediting the association with the whole as heretofore.

The income for the year exceeded the expenditure by £1 4s. 9d. and the amount in hand is more than £225.

The election of officers, etc., for the coming year resulted as follows: President, Mr. Wm. Thompson; vice-presidents, Messrs. J. W. Moore, J. Proud; secretary and treasurer, Mr. E. Moody; auditors, Messrs. E. F. Jones and C. F. Lonsdale; general committee, Messrs. E. Barker, T. Corbett, R. Marshall, R. Mothersdale, E. M. Tweddle, J. A. Tweddle, A. Stephenson, F. R. Turnbull, J. B. Wilson; representatives to Northern Federation meetings, Messrs. W. M. Thompson, J. Proud, A. Stephenson, J. W. Moore, E. M. Tweddle and J. B. Wilson; Tees-side representatives Messrs. E. Barker, R. Mothersdale, T. Corbett, F. R. Turnbull, J. A. Tweddle, and W. M. Thompson.

Minutes of the Northern Centre, Northern Centre Conciliation Board and Northern Federation Executive meeting were read.

A long discussion took place upon the question of agreements between contractors and their sub-contractors, the latter taking up the question with a view to getting more satisfactory conditions as to their payments during the progress of contracts, and it was ultimately decided that the meeting be adjourned for a week, when it was expected a form of contract would be submitted.

MIDDLESBROUGH ASSOCIATION.
Secretary: Walter Rigby.

The annual general meeting of the Middlesbrough and District Building Trades Association was held in the Grand Hotel, on Tuesday, December 1st, the retiring president, Mr. W. S. Davison, in the chair. There was a good attendance of members. The Treasurer's report, showing a good balance at the bank, was read and adopted. The Secretary's report was read and adopted, and the thanks of the meeting were accorded him. The report showed that although the year ending November 30th had been a quiet one, the Association had grown financially, had increased its membership, and was arresting the attention, locally, of all interested in the building trade. The one thing to be regretted was the great slackness of trade. Contracts were few and far between, and consequently competition was very keen. Dealings with architects had been only too infrequent, but, on the whole, pleasant. There had been one or two little clouds on the labour horizon, but the only permanent one is the lack of employment. The inter-trading rule, which has operated so successfully since its adoption, has again been of great service. The rule pays well any care bestowed upon it. Attention was especially called to the arrangement made by the National Federation, by which the BUILDERS' JOURNAL becomes the official organ of the building trades. The Journal is of especial interest to builders, and publishes monthly reports of association work. To subscribers through the association, the journal can be delivered by post at less than the bookstall cost.

Executive meetings have been very well attended, and a marked improvement has taken place in the monthly general meetings. The following officers were elected: President, Mr. W. Masters (Messrs. Masters and Binning, plasterer contractors); vice-president, Mr. W. S. Davison (Messrs. Vinter and Davison, builders); treasurer, Mr. C. Griffiths; secretary, Mr. Walter Rigby, 17, St. John's Terrace, Middlesbrough; Executive Committee: Messrs. Davison, P. Bray, G. Hudson, E. Baker, S. Coates, W. B. Robinson, T. Wilkinson, H. McNaughton, H. Doughty, T. Metcalfe, J. Vinter, W. Bastiman and the officers; Representatives to Teesside Federation: W. Masters, H. McNaughton, P. Bray, W. S. Davison, W. Bastiman, T. Wilkinson, J. W. Vinter, W. B. Robinson, G. Hudson; representatives to Northern Counties Federation: W. Masters H. McNaughton, W. S. Davison, W. Bastiman, G. Hudson, T. Wilkinson, P. Bray, S. Coates, H. Doughty.

Messrs. Halliday and Platts, builders, and Messrs. Tattersall and Clarke, electricians and steeplejacks, were accepted for membership. A hearty vote of thanks was passed to the retiring officers. The next general meeting to take place the second week in January, 1909, to be followed by a smoking concert.

The interior of Messrs. Appleyard and Sons' business premises in the Albert Road has been reconstructed, and the front elevation has been completed in Burmantofts Marmo, with leaded casement and copper name signs. The work has been executed by Messrs. Allison Bros., contractors, Middlesbrough, from a design by Mr. W. G. Roberts, architect, Middlesbrough.

NEWCASTLE AND TYNE DISTRICT.
Secretary: Wilton A Rycroft.

The annual meeting of the Newcastle and Tyne District Association was held on Thursday, November 26th, Mr. R Heslop presiding over a fair attendance of members. The chairman having proposed that a vote of condolence be passed with the widow and family of the late Edward Weatherley, one of the oldest members of the association, in their loss, the business of the meeting was proceeded with.

The treasurer presented the accounts for the past year, showing a substantial balance in favour of the Association. The accounts were duly passed.

The following officers were appointed for the current year: President, Mr. Wm. Foster; vice-president, Mr. J. C. Hope; hon. treasurer, Mr. W. T. Weir; hon. auditors, Mr. A. Pringle, and Mr. J. C. Hope. A committee, and Representatives to the Northern Counties and the Tyne and Blyth District Federations were also elected.

Discussion on various matters included the taking of the BUILDERS' JOURNAL by all the members, the question of inter-trading, and the annual dinner of the Tyne and Blyth District Federation.

The meeting concluded with a hearty vote of thanks to the late president for the manner in which he had filled the chair in the past two years, and for the interest shown by him in the association during his membership extending over many years. Mr. Heslop, in reply, congratulated the association on its freedom from disputes with the operatives during his period of office, due in his opinion to a great extent to efficient organisation on its part, and thanked the past presidents and other members for the help and support extended to him. At the same time, he thought it might be as well to originate something to create more interest among the general body of members, instancing debates on matters of special interest to the trade. He regretted that the state of trade in the district was so bad, but felt that it could not continue in that condition indefinitely; he looked forward to a change shortly, and trusted that the association would continue to flourish, and that it would be even more successful in the future than it had been in the past.

The annual dinner of the Tyne and Blyth District Federation is to be held at the Royal Exchange, Grey Street, Newcastle-on-Tyne, on Thursday, December 17th, at 6.30 prompt, when a full attendance of members and their friends is expected.

SUNDERLAND AND DISTRICT ASSOCIATION.
Secretary: W. H. Hope, Solicitor.

The annual meeting of the Sunderland and District Association was held in the board room, 14, Norfolk Street, Sunderland, on Tuesday, November 24th, at 8 p.m., when a good attendance was present, with Mr. R. J. Huntley (president) in the chair, and Mr. J. Morice Wright in the vice-chair.

The minutes of the general meeting, held on October 6th, were read and signed as correct by the president.

The recommendation passed by the executive council *re* the notice for the alteration of the working rules was considered, and it was resolved: "That it is desirable, when dealing with notices to or from the operatives for any alteration in the working rules, that at least a fortnight shall be allowed to consider the same, and to send in a counter-notice if such notice or notices be received on the last day." Such a rule might do away with either side giving to the other notice of alteration of rule in anticipation of the other side doing likewise. If it is open to either side to give a counter-notice, none might be given, except in cases where a change of rule was really desirable.

On the proposition of Mr. W. B. Cooper, seconded by Mr. J. Morice Wright, it was resolved and carried unanimously: "That this Association approach the operatives with a view to their adopting this resolution without formal notice."

A notice of motion *re* the alteration of working hours (winter) of the bricklayers and joiners was carefully discussed. The proposed alterations are: (b) "From November 8th until November 20th (both inclusive), all men shall commence work at 7 a.m., and cease at 4.30 p.m. (instead of 5 p.m.), with half and hour for breakfast, and one hour for dinner, except on Saturdays, when work shall cease at 12 noon, with the usual half-hour for breakfast, making a total of 44½ hours per week (instead of 47). (c) From November 21st until January 31st (both inclusive), all men shall commence work at 8 a.m., and cease work at 4 p.m., with no time for breakfast and 30 minutes for dinner, except on Saturdays, when work shall cease at 12 noon, with the usual half-hour for breakfast, making a total of 41½ hours. (d) From February 1st until February 20th (both inclusive), all men shall commence work at 7.30 a.m., and cease work at 4.30 p.m., with 20 minutes for breakfast and forty minutes for dinner, except on Saturdays, when work shall cease at 12 noon with the usual half-hour for breakfast, making a total of 44 hours per week." To avoid working hours when it is impossible, through want of light, to see to work, it was further resolved: "That a copy of the notice of motion be forwarded to each member, asking for suggestions which would be considered at a special general meeting of the association."

In the absence of the hon. treasurer, the president presented a satisfactory balance sheet, and congratulated the members upon the sound financial position of the association. He had to regret that the income derived from the insurance commission was considerably below that of last year. This was owing to the large rebates due to the members; and in anticipation of this, the subscription for the year 1908 had not been reduced below that of the preceding year. He recommended that the sum of £100 should be placed upon deposit. This was seconded by Mr. James Taylor, and carried unanimously.

On the proposition of Mr. W. B. Cooper, seconded by Mr. James Taylor, Mr. Robert J. Huntley was unanimously re-elected president. In returning thanks for his re-election, the president said that during the past year his duties had been very light, owing, unfortunately, to the stagnation in the building trade. He would like to draw the members' attention to the rule for preferential treatment which had been put into force at the beginning of the year, resulting in a large increase of membership. Owing, perhaps, to the depression of trade in the district, the rule had not been so stringently enforced as it might have been, but he hoped the members would adhere to the rule wherever possible, thereby bringing into the association those desirable tradesmen who remained outside its ranks.

On the proposition of Mr. J. McMillan, seconded by the president, Mr. J. Morice Wright was unanimously re-elected vice-president. Mr. J. M. Wright suitably thanked the members for his re-election. On the proposition of the president, seconded by Mr. Robert Swan, Mr. Fred W. Ranken was re-elected hon. treasurer, and Messrs. R. J. Hunson and J. T. Clark, hon. auditors.

The following were elected upon the executive council: Messrs. Robert J. Huntley, J. Morice Wright, J. W. White, F. W. Ranken, W. B. Cooper, J. McMillan, A. Stafford, G. Swan, R. Swan, J. M. Gibbons, J. Emmerson, J. T. Clark, R. Kerrison, P. Harle, and James Taylor.

The employers' representatives on the Sunderland Conciliation Board for the Building Trades were appointed, as were also the bricklayers' trade committee. The following were appointed upon the board of representatives of the Northern Counties Federation of Building Trades Employers:—Messrs. Robert J. Huntley, J. M. Wright, J. W. White, F. W. Ranken, W. B. Cooper, J. Emmerson, A. Stafford, and J. McMillan.,

The secretary presented his tenth annual report of the work of the association, which dealt with the steps taken by the association to cover the members' liability under the Workmen's Compensation Act (1906); the relations with the operatives, which had fortunately been free from friction; the work of organisation, and the adoption of the rule for Preferential Treatment; the wages of the operatives; the adoption of the BUILDERS' JOURNAL as the official journal of the National Federation; the Sunderland Corporation (1907) Act; breaking up of streets, etc., to lay drains and service pipes; and several other matters.

The question of the annual dinner was discussed. A poll had been taken amongst the members, and the result had been against the holding of the dinner in view of the distress in the town. On the proposition of the president, seconded by Mr. J. T. Clark, it was resolved: "That the association hold an excursion in the summer in lieu of the annual dinner."

There is nothing to report from the following associations affiliated to the Northern Counties Federation: Gateshead, Stockton-on-Tees, Sunderland, North Shields, South Shields, Tees-side.

TYNE AND BLYTH DISTRICT BUILDING TRADES FEDERATION.

Secretary: W. H. HOPE, Solicitor, Post Office Chambers, 14, Norfolk Street, Sunderland.

A meeting of the dinner committee appointed to consider the question of holding a joint annual dinner of the local associations affiliated to the Tyne and Blyth District Federation, was held at Sunderland on November 24th, Councillor Stephen Easten, of Newcastle-on-Tyne, in the chair. It was decided, on the proposition of the North Shields representatives, who could not see their way to recommending their own town, that the joint annual dinner be held at Newcastle-on-Tyne.

The dates proposed were December 9th or 10th; failing that, the Wednesday or Thursday of the following week. It was left in the hands of the Newcastle Association to decide upon a convenient date and hotel. The price of the dinner tickets was fixed at 6/- each. It was decided to invite the mayors of the different towns, and the presidents of the National Federation and of the Northern Architectural Association, and the presidents of the local associations affiliated with the Northern Counties Federation outside the district federation's area, and the National secretary (Mr. A. G. White), and that the invitations of architects and the officers of the local authorities be left to each local association or to individual members. The musical arrangements were left to the local secretaries and the Federation secretary (Mr. W. H. Hope).—W. H. HOPE.

THE MIDLAND CENTRE OF THE NATIONAL FEDERATION.

Secretary: F. W. AMPHLET, 58, New Street, Birmingham.

The only meeting held of the Midland Centre, since last report has been that of the Midland Centre Conciliation Board, in Birmingham, on November 12th. Mr. John B. Whitehouse (Birmingham) presided, and most of the members of the Board, or their substitutes, were present. The Board met to consider a dispute having reference to the area of the Leicester district. The bricklayers, carpenters, and labourers were involved in the matter, which the Leicester Local Conciliation

THATCHING AND REED LAYING.
J. G. COWELL, SOHAM.

A "Builders' Journal" Small Want Advertisement offers you an unequalled field, inasmuch as it comes before the direct notice of thousands of employers of labour. The rates less than ½d. per word.

Board had been unable to settle. Mr. W. Yates (Leicester M.B.A.), explained that both sides had agreed to refer the matter to the Mayor of Leicester as arbitrator. The operatives, however, had inserted a condition as to settlement in the statement submitted to the mayor, which brought the matter to a deadlock. Mr. A. Chambers (Leicester M.B.A.) said the question was whether a job that was being carried out by Mr. Chapman, at Wigston, just over four miles from Leicester, came within the Leicester district. He quoted from the working rules in support of the employers contention that the boundary of the Leicester district was a radius of three miles from the Clock Tower as a centre. He also stated that he had letters (two of which he read), from 12 builders, within 4½ miles radius from the Clock Tower, who were not observing the Leicester working rules. Messrs. T. Hickley, A. J. Smith, J. W. Whiston (on behalf of the operatives), claimed that, with the exception of alteration of the working points, the present rules were practically the same as those which had been in existence for the past 28 years. The operatives had opposed the three miles radius from the Centre when the rules were under revision in 1905. From the signing of the rules in that year, it had been understood that the boundary of the Leicester district was three miles from the 1¼ miles walking points. Cases were quoted in support of this contention. After the representatives had stated their case, and the Board had considered the matter, a resolution was proposed to the effect that a radius of 4½ miles from the Clock Tower constitute the Leicester area. The following amendment was then submitted:—"That the Leicester District be defined as a three miles radius from the Clock Tower." The voting resulted in a tie, all the employers voting for, and all the operatives against the amendment. The representatives having re-entered the room, the chairman said he regretted to inform them that the Board had been unable to settle the dispute. The Board was generally agreed that the working rules were badly drawn up, and a suggestion had been made that both parties should agree to a revision of the whole of the rules. The representatives accorded the chairman and the board a hearty vote of thanks for the consideration they had given to the dispute, and the proceedings then terminated.—FRED W. AMPHLETT.

LOCAL ASSOCIATIONS AFFILIATED TO THE MIDLAND CENTRE.

BIRMINGHAM ASSOCIATION.
Secretary: E. J. Bigwood, J.P.

The inter-trading rule was adopted by the Birmingham Association at the annual general meeting, held at the Grand Hotel, Colmore Row, Birmingham, on Tuesday, November 10th, and a sub-committee has been appointed to revise the rules of the association.

A meeting of the local Conciliation Board was held at the Imperial Hotel, Temple Street, on Wednesday, November 18th. The dispute was between Messrs. Tomkinson and Son, of Dansie Street, Liverpool, and the bricklayers. Messrs. Tomkinson were carrying out alterations to premises in Bull Street, Birmingham, and as the work was urgent, the bricklayers were engaged in two shifts (day and night). The men working on the night shift claimed that they should be paid overtime rate for the whole of such time worked, but as there is no local rule on this point the employers could not agree, and the whole question has been referred to the Midland Centre Conciliation Board.

Notices of alterations to working hours have been received from the various operatives.

LEICESTER ASSOCIATION.
Secretary: S. A. Dove.

The number of members to date of the Leicester Association is 127.

The monthly meeting of the council was held on November 11th, when the chair was occupied by the president, Mr. W. Yates.

A discussion arose re tenders for work with specifications and plans without quantities when the job was in competition. It was thought that this plan should be a universal one throughout the whole sections of the Association.

It was resolved that the association subscribe to the BUILDERS' JOURNAL, so that the secretary should be in touch with all the news of the National Federation.

Eight new members were elected.

A letter was read from Midland Centre re the question of the uniformity of working rules, and it was decided that each branch should meet and discuss the matter and report to the next meeting.

On November 30th, communications were sent to the secretaries of the operatives' societies giving notice of alterations of working rules and boundaries. This was done in order that all the starting-times and the boundaries should be as far as possible uniform.

For some time past there has been a dispute with the operatives with reference to the area of the Leicester district. On August 26th, the Association received a letter from the operatives calling their attention to two breaches of the working rules by one of our members. One of these breaches was that he was not paying the standard rate of wages, and the other was that he was not allowing walking time although the job was situated outside the three miles from the Clock Tower. The Association, after consideration, supported their member in his action, and it was mutually agreed that the Local Council be called together to discuss and if possible decide the question. The local representative of the Board of Trade, Alderman T. Smith, who at the time was mayor, was asked to preside as independent chairman. The meeting took place in the Council Chamber of the Town Hall, on September 16th, and was adjourned to the 21st, and again to the following day. No agreement being arrived at on the latter date, both sides mutually agreed that the chairman be appointed arbitrator to define the Leicester District, each side to prepare their case and submit within seven days.

At a further conference, held on October 7th, the arbitrator said that in the written statement by the operatives they specifically asked him to define the area of the Leicester District to read: "Either as to its being three miles from the Clock Tower or as to its being three miles from the walking boundaries" (that is, three, or four and a half miles from the Clock Tower as a centre); whilst the employers left the arbitrator at full liberty to give any decision, not confining him to either the three or the four and a half miles. On the operatives declining to accept the rendering of the agreement as suggested by the employers, the conference broke up without any settlement of the case. The employers then asked for the matter to be laid before the local Conciliation Board, and that Board met on October 27th, when the case on behalf of the employers was again presented by Mr. Arthur Chambers. The local Conciliation Board considered it fully, but were not able to agree, and it was resolved that the joint secretaries be requested to make the necessary arrangements to bring the matter up to the Midland Centre Conciliation Board. That Board met on November 12th, and after a long sitting found they were unable to settle the dispute.

A full meeting of members was held on November 18th, when it was resolved that the matter be handed over to the National Conciliation Board. This Board met on November 26th, in London when the case was again presented by Messrs. A. Chambers and W. Yates. It was pointed out by Mr. Chambers that builders beyond three miles from the Clock Tower had never considered themselves within the Leicester District, and that they were paying smaller wages than the Leicester District called for; further, if Leicester workmen were set on by them, they had to be at the job at starting time, and were not allowed walking time. This is a great drawback to Leicester builders when they are called to pay more wages than the country builders, besides allowing walking time, as they could not successfully compete with the country builders; consequently Leicester builders were very short of work, and the country builders were very busy. It was stated by the operatives that some builders did pay Leicester conditions outside the three miles from the Clock Tower; but why should the operatives claim as a right what many employers have granted as a favour, or perhaps in order to avoid difficulty and trouble; particularly as many of the jobs are but small ones, and on many occasions the men were sent from the employer's shop; and the employers always have paid walking time when the men have been sent from Leicester?

Eventually the witnesses withdrew; to be informed that, after but a few minutes' consideration, the Board had decided the question in favour of the workmen.

NORTHAMPTON ASSOCIATION.
Secretary A. L. Airs.

The monthly committee meeting of the Northampton Association was held at the Peacock Hotel, Northampton, on Friday evening, November 13th. There were very few members present, and in the absence of the president (Mr. E. Archer), who had gone to Paris to attend the International Congress, Mr. R. W. Harris (vice-president) took the chair. There was no very important business to bring forward. The state of trade is still very bad. It was decided to subscribe to the BUILDERS' JOURNAL, for the use of the secretary.

There is nothing to report from the following associations affiliated to the Midland Centre: Bromsgrove, Burton-on-Trent, Coventry, Derby, Dudley, Hinckley, Kidderminster, Leamington, Lincoln, Long Eaton, Loughborough, Mansfield, Newark, North Staffordshire, Nottingham, Nuneaton, Redditch, Stafford, Stourbridge, Walsall, West Bromwich, Wolverhampton, Worcester.

THE LONDON FEDERATION.

Secretary: T. COSTIGAN, 31 & 32, Bedford Street, Strand, London, W.C.

The Council of the London Master Builders' Association met on November 19th, and transacted business connected with the following subjects:—1. Joint office premises committee's report. 2. An application from the stonemasons' society on the question of piecework and working rule agreement were duly considered. 3. Correspondence was read. It was decided that the association become a subscriber to the BUILDERS' JOURNAL.

THE SOUTH-WESTERN CENTRE OF THE NATIONAL FEDERATION.

COMPOSED OF

The South-Western Federation, and

The South Wales Federation.

Secretary: W. F. LONG, 3, Northumberland Buildings, Bath.

BATH ASSOCIATION.
Secretary: E. J. Meredith.

A general meeting of the Bath Association was to have been held on Saturday, November 28th, but owing to the enforced absence of the president, vice-president, and four or five other important members of the committee, mainly through illness, no business was transacted.

Trade here is as dull as possible in all branches.

BRISTOL ASSOCIATION.
Secretary: A. J. Pitt.

As decided upon at the previous meeting, the members of the Bristol Association gave special consideration, at their monthly meeting on November 26th, to the sub-contracting clause in the National form of contract, which provides that "all specialists, merchants, tradesmen, or others executing any work, or supplying any goods for which prime cost prices or provisional sums are included in the specification, who may at any time be nominated, selected, or approved by the architect, are hereby declared to be sub-contractors employed by the contractor; but no such sub-contractor shall be employed upon the works against whom the contractor shall make what the architect considers reasonable objection, or who will not enter into a contract with the contractor upon terms and conditions consistent with those in this contract, and securing the due performance and maintenance of the work supplied or executed by such sub-contract, and indemnifying the contractor against any claims arising out of the misuse by the sub-contractor or his workmen of any scaffold erected or plant employed by the contractor, or that may be made against the contractor in consequence of any act, omission, or default of the sub-contractor, his servants or agents, and against any liability under the Workmen's Compensation Act, 1897, or any amendment thereof."

This clause, it was felt was not so satisfactory to the builder as that recently adopted by the Bristol Corporation, a paragraph of which reads that "provided that if the contractor shall be required by the architect (or engineer), the Corporation, or the specification to employ any particular sub-contractor, he shall not be responsible for work done or materials supplied by such sub-contractor, nor shall he be responsible to see that the clause relating to the payment of wages, and the observance of the hours and conditions of labour is carried out with reference to the persons or workmen employed by such sub-contractor."

It will thus be seen that, under this clause, the contractor is relieved from all responsibility for work executed by sub-contractors or specialists specified by the architect or engineer, so that he is not put to the trouble or necessity of entering into a contract with the sub-contractor upon the terms of the original contract.

It was, of course, recognised by the members that any alteration in the existing form was a matter attended by great difficulties, and it was accordingly decided to communicate with the secretary of the National Federation, Mr. A. G. White, and to ask him to bring the views of the Bristol Association before the next meeting of the emergency committee for their consideration.

There is nothing to report from the South-Western Centre, nor from the South-Western Federation, nor from the following affiliated associations: Bridgewater, Cheltenham, Exeter, Gloucester, Hereford, Stroud, Taunton.

THE SOUTH WALES FEDERATION.

Secretary: W H. BILLINGS, Salubrious Chambers, Swansea.

LOCAL ASSOCIATIONS AFFILIATED TO THE SOUTH-WALES FEDERATION.

NEWPORT (MON.) ASSOCIATION.
Secretary: R. Richards.

The monthly meeting of the Newport (Mon.) Association was convened for Wednesday, November 3rd. Many special matters were to be considered, among them the question of apprenticeship indenture, suggested new rules applicable to the Swansea operatives, advertisements in the official organ, and a communication from the Lancashire and Cheshire, etc., Building Trades Employers' Federation re enquiry as to fair wages clauses in corporation contracts.

Building operations in the town are generally quiet, but in the Monmouthshire valleys generally building operations are more brisk. Especially is this so in colliery districts.

Work at the new County Borough Technical Institute at Newport has not yet commenced. This is to be regretted in view of the depressed condition of the trade.

The 41st annual dinner of the association was to be held Tuesday, December 8th, at King's Hotel, at 6.30 p.m. The association has invited the leading citizens and professional gentlemen to the dinner, and amongst those gentlemen who had accepted and signified their intention of attending are the Mayor of Newport (Councillor W. Graham White, J.P.), ex-Mayor Councillor Tom Parry, J.P., Alderman Mark Mordey, J.P., Mr. L. H. Hornby, Mr. R. H. Haynes (borough engineer), Mr. John Bain, F.R.I.B.A. (county architect), Mr. E. Maples Linton, Mr. Edgar Fawckner (Messrs. Habershon and Fawckner), and many others.

There is nothing to report from the South Wales Federation, nor from the following affiliated associations: Cardiff, Pontypridd, Swansea.

SCOTTISH BUILDING TRADES FEDERATION.

Secretary: JAMES CAMERON, Solicitor, 61, Lothian Road, Edinburgh.

ASSOCIATIONS AFFILIATED TO THE SCOTTISH FEDERATION

EDINBURGH, LEITH, AND DISTRICT BUILDING TRADES ASSOCIATION.
Secretary: James Cameron, Solicitor.

The monthly meeting of the executive of the Edinburgh, Leith and District Association was held in the Building Trades Exchange, Edinburgh, on Thursday afternoon, November 26th. Mr. David McKie presided, 10 members being present.

The minutes of the former meeting having been adopted, the secretary submitted the names of 16 gentlemen for membership, all of whom were duly admitted. He mentioned that he had secured these proposals in consequence of the circular that had been issued anent the inter-trading rule, and thought that the results had amply justified the action taken by the association. The secretary was cordially thanked, and as an acknowledgment of what he was doing in the interests of the association, the meeting agreed to recommend the association at its annual meeting to allow the secretary 5s. for every new member he secured.

A report on the state of trade showed it to be about the same as last month, and worse than last year at this time.

The secretary reported the present position of matters regarding the opposition to the Edinburgh and Leith Gas Commissioners doing the plumber work on the new buildings for the Gas Commission at Waterloo Place. He stated that he had written to the clerk to the Gas Commissioners asking why schedules had not been issued for the plumber work, as was done in connection with the other departments of the work, and also under what Act of Parliament or Provisional Order the Commissioners had power to do the work themselves—employing men and supplying material. No reply had been received to that communication, as the Gas Commissioners had not met up to the time of reporting.

The annual dinner of the association will be held in the Royal British Hotel, Princes Street, on Thursday evening, December 10th. The following associations have accepted invitations to be represented at the dinner, namely, Glasgow Master Masons' Association, Glasgow Master Wrights' Association, Glasgow Master Plumbers' Association, Edinburgh Architectural Association, Edinburgh Ordained Surveyors' Society, and Edinburgh and Leith House Factors' Association, while the Corporations of Edinburgh and Leith are also to be represented.

Since the issue of the circular *re* the inter-trading rule, the local Press has given the circular in detail, and commented on the "extraordinary move by the Edinburgh Builders." It has ended there, however, for no correspondence has ensued in the papers.

There is nothing to report from the Scottish Building Trades Federation, nor from the following affiliated associations: Aberdeen, Alloa, Dingwall, Dumfries, Dundee, Hawick, Inverness, Keith, Kilmarnock, Oban, Paisley, Perth.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Dec. 10. LONDON, N.W. — Erection of new church at Golder's Green (Parish of All Saints', Child's Hill, N.W.). Bills of quantities obtainable from Wills and Anderson, architects, 24, Bloomsbury Square, W.C. Deposit of £1 will be required. Sealed tenders required by Dec. 10.

Dec. 10. SALISBURY.—Internal and external renovations to the Fisherton County Police Station, Salisbury, and for erecting a new wash-house, for the Wilts C.C. Specifications and form of tender can be obtained on application to the county surveyor, Trowbridge. Sealed tenders, addressed to the county surveyor, and endorsed "Tender for Fisherton County Police Station," must be delivered at the office of J. G. Powell, county architect and surveyor, County Surveyor's Office, Trowbridge, on or before Dec. 10.

Dec. 12. LEEDS.—Alterations necessary to convert the building hitherto known as the Queen's Arcade Hotel into a cafe. Contractors desirous of tendering are requested to send their names to W. Broadbent, M.S.A., architect, Red Hall Chambers, Guildford Street, Leeds, and at Horsforth, on or before Dec. 12.

Dec. 12. REDCAR.—Alterations and extensions to Ings Farm buildings, near Redcar, for the Marquess of Zetland. Tenders are invited for slater's work. The quantities may be seen at the Zetland Estate office, Marske, between the hours of 9 a.m. and 5 p.m. Tenders to be endorsed "Ings," and delivered to T. E. Senior, Zetland Estate Office, Marske-by-the-Sea, not later than Dec. 12.

Dec. 12. PENDEEN.—Erection and completion of proposed Council school at Pendeen, near St. Just, for the Cornwall Education Committee, according to plans and specification which may be seen by appointment at the school, or at the office of S. Hill, architect to the Committee, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Forms upon which all tenders are to be made may be had from the architect or at the School. Sealed endorsed tenders are to be sent to F. R. Pascoe, secretary, Education Office, Truro, on or before Dec. 12.

Dec. 12. BANDON.—Erection of 144 single cottages, with fencing of an acre plot of land to be attached in every case, at a cost not exceeding £130 per cottage and plot, for the Bandon R.D.C. The works to be completed within six months after the sites have been laid out by the Council's engineer, under a penalty for delay of £1 per week for each cottage. A deposit of £2 per cottage must be lodged with each tender, and an official acknowledgment obtained therefor. Conditions of contract and any other particulars required, as well as tender forms, can be had on application fro A. Haynes, clerk of District Council, Council Office, Workhouse, with whom tenders should be lodged not later than 11 a.m. on Dec. 12.

Dec. 14. BLACKBURN.—Erection of a bandstand, in the Corporation Park, Blackburn, for the Parks Committee. Tenders, etc., to be sent to W. Stubbs, A.M.I.C.E., borough engineer, Municipal Offices, Blackburn, on or before Dec. 14.

Dec. 14. BIRKENHEAD.—Alterations and additions to the Welsh Independent Chapel, Victoria Street, Birkenhead. Plans and specifications may be inspected with L. W. Williams, architect and surveyor, 410, Park Road North, Birkenhead, to whom sealed tenders should be delivered on or before Dec. 14.

Dec. 14. NORTH BROOMHILL.—Alterations to branch premises, North Broomhill, for the Broomhill Co-operative Society, Ltd. Plans and specifications can be seen upon application to the Secretary at the Society's Central premises, Broomhill. Tenders to be delivered not later than December 14, addressed to the committee and endorsed "Tender for alterations."

Dec. 14. BRIDLINGTON.—Erection of a new chancel and organ chamber to the church of St. Anne's, at the Convalescent Home, Bridlington. Persons desirous of tendering can obtain bills of quantities of W. S. Walker, F.R.I.B.A., architect, 52, Quay Road, Bridlington. Only whole tenders will be considered. Tenders to be delivered to the architect at the same address not later than 10 o'clock on December 14.

Dec. 14. WEDNESBURY.—Erection of a public sanitary convenience near the Market Place, for the Town Council. Plans, specification, and conditions of contract (no quantities) can be inspected and form of tender obtained, at the offices of E. M. Scott, borough engineer and surveyor, Town Hall, Wednesbury. Sealed tenders, to be addressed to the borough surveyor, endorsed "Public Sanitary Convenience," by Dec. 14. Fair wages clause.

Dec. 14. MIDDLETON.—Following works in connection with the erection of a new school in Durnford Street, Middleton, for the Corporation: Draining all the premises; tiling of rooms, hall, corridors, etc. Specifications, quantities and form of tender, which will include a fair wages clause, and any further particulars may be obtained from E. Wood, architect, 78, Cross Street, Manchester. Tenders, endorsed "Draining," or "Tiling," as the case may be, and addressed to the Chairman of the Education Committee, must be delivered at the office of F. Entwistle, town clerk, Town Hall, Middleton, not later than Dec. 14.

Dec. 15. RAVENFIELD.—Erection of a new school at Ravenfield for the West Riding C.C. Whole or separate tenders are invited. A deposit of £1 must be paid to the West Riding treasurer, and sent to him direct at the County Hall, Wakefield, otherwise applications will not be entertained. Sealed tenders, properly endorsed, to be sent not later than 10.30 on the morning of Dec. 15, to S. Abson, divisional clerk, Woodhouse, Sheffield.

Dec. 15. WORCESTER.—Erection of new station buildings at Bransford Road, near Worcester, for the directors of the Great Western Ry. Co. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the engineer at Gloucester Station, between the hours of 10 a.m. and 4 p.m. Tenders, addressed to G. K. Mills, secretary, Paddington Station, London, and marked outside "Tender for Works at Bransford Road," will be received on or before Dec. 15.

Dec. 15. DURHAM.—(1) Removal of iron school from Dean Bank to Chopwell. (2) Alterations and improvements at Sedgefield Infants' Council School, for the Durham C.C. Plans, specification, and general conditions of contract may be seen, and bills of quantities (for Sedgefield Infants' Council School only) obtained at the office of F. E. Coates, A.R.I.B.A., Shire Hall, Durham. Sealed tenders, endorsed with name of school, are to be sent to A. J. Dawson, clerk to the Education Committee, Shire Hall, Durham, on or before Dec. 15.

Dec. 15. LONDON, E.—Repairing, painting, and sundry work at Essex Road, Hartley Avenue, Plashet Lane, and Shaftesbury Road Schools, for the Education Committee of East Ham. Specifications and forms of tender may be obtained at the Education Office, Wakefield Street, East Ham. The work must be completed by the end of the next ensuing Christmas vacation. The contractor must deposit with each tender a £5 Bank of England note or crossed cheque of equal value. Tenders, on the printed form, must be delivered to H. C. Padgett, secretary, Education Office, East Ham, E., not later than 3 o'clock in the afternoon of Dec.15, and should be endorsed "Tender for General Repairs." Tenders may be made by any one contractor in respect of all or any of th schools named in the specifications. Fair wages clause.

Dec. 16. TREORCHY, Wales.—Erection and completion of a new vestry at Treorchy, Rhondda Valley, for the Trustees of Noddfa Baptist Chapel, Treorchy. Plans and specification may be seen and bills of quantities obtained at the office of W. D. Morgan, M.S.A., architect, 194, Ystrad Road, Pentre, on payment of a deposit of £1 1s. Sealed and endorsed tenders to be delivered by noon on Dec. 16.

Dec. 16. RIPON.—Improvements at Ripon Station, for the Directors of the North-Eastern Railway. Plans and specification may be seen and quantities and further information obtained upo application to W. Bell, the company's architect, at York. Duplicate plans may also be seen upon application to the Station-master, Ripon. Quantities supplied on personal application to parties tendering for the whole of the works. Sealed tenders, marked "Ripon Station Improvements," to be sent to the Secretary at York, not later than 9 a.m. on Dec. 16.

Dec. 16. CORK.—Erection of new barrack floor, Cork Barracks, Ireland. The plans and specification may be inspected at the office of the Director of Barrack Construction, Cork, up till Dec. 9th. A copy of the bills of quantities and form of tender may be obtained on application, addressed to the Director of Barrack Construction, 80, Pall Mall, London, S.W., if accompanied by a remittance of 10s., payable to him. No application will be considered if received after Dec. 11. Tenders must be addressed in sealed envelopes to the Director of Army Contracts, War Office, Whitehall, London, S.W., and must be delivered not later than 12 o'clock noon, on Dec. 16. The envelope should be marked "Tender, New Barrack Block, Cork." The bills of quantities should accompany the tender in a separate sealed envelope similarly addressed, and marked "Bills of Quantities, New Barrack Block, Cork," and should bear the contractor's name and address thereon.

Dec. 16. CURRAGH CAMP.—Erection of one block of married soldiers' quarters at Curragh Camp, Co. Kildare, Ireland. The plans and specification may be inspected at the office of the Director of Barrack Construction, Curragh Camp, up till Dec. 9. A copy of the bills of quantities and form of tender may be obtained on application addressed to the Director of Barrack Construction, 80, Pall Mall, London, S.W., if accompanied by a remittance of 10s., payable to him. No application will be considered if received after Dec. 11. Tenders must be addressed in sealed envelopes to the Director of Army Contracts, War Office, Whitehall, London, S.W., and must be delivered not later than 12 o'clock noon, on Dec. 16. The envelope should be marked "Tender Married Soldiers' Quarters at Curragh Camp." The bills of quantities should accompany the tender in a separate sealed envelope, similarly addressed, and marked "Bills of Quantities, Married Quarters, Curragh Camp," and should bear the contractor's name and address thereon.

Dec. 17. BRECON.—Construction of new cells, and for various alterations, re-building, etc., at the Builth Police Station, for the Standing Joint Committee. The plans and specification can be seen at the office of C. W. Best, M.I.C.E., County surveyor for Breconshire, County Hall, Brecon, and bills of quantities obtained on deposit of £2 2s. Tenders must be delivered at the same place not later than 12 noon on Dec. 17.

Dec. 17. MULLINGAR.—Keeping in repair all the roofs, downpipes, gutters, and internal plastering of the entire Asylum. No attendance will be provided other than that of patients' labour. For the Joint Committee of Management of the District Lunatic Asylum, Mullingar. Form of tender can be obtained at the Asylum Office (none other will be considered) between the hours of 10 a.m. and 5 p.m. daily, up to Dec. 12, on deposit of £1 as proof of bona-fide. Sealed tenders are to be deposited in the Asylum tender box at or before 11 o'clock a.m. on Dec. 17, or, if by post, to be addressed to the Resident Medical Superintendent, marked "Tender for ——." Securities required.

Dec. 18. CARDIFF.—Supply, delivery, and erection at the generating station of the following, for the Corporation:—One 2,500 K.V.A. turbo-alternator complete, with surface condensing plant and motor-driven auxiliaries. Specifications and form of tender may be obtained from A. Ellis, City electrical engineer and manager, Central Offices, the Hayes, Cardiff, on payment of a deposit fe of £1 1s. The successful contractor will be required to enter into the usual form of agreement, a copy of which can be seen at the town clerk's office. Sealed tenders, endorsed "Turbo-alternator," to be delivered at the office of J. L. Wheatley, town clerk, City Hall, Cardiff, on before 10 a.m., Dec. 18.

Dec. 19. MERTHYR TYDFIL.—Erection of 38 houses at Danyderi, Merthyr Vale, and 68 houses at Penywern, Dowlais, for the Corporation. Separate tenders, endorsed "Danyderi Houses" and "Penywern Houses" respectively, must reach T. A. Rees, town clerk, Town Hall, Merthyr Tydfil, not later than 12 o'clock noon on Dec. 19. Plan and specifications may be seen and forms of tende obtained at the office of the borough surveyor, Town Hall, Merthyr Tydfil.

Dec. 19. ACCRINGTON.—Erection and completion of public baths, laundry, boiler-house and chimney to be built in St. James' Street, adjoining the premises of the Salvation Army, for the Corporation. Plans and drawings may be seen, and forms of tender, with specifications, general conditions, bill of quantities, etc., obtained, on application to the architect, W. J. Newton, borough engineer, Town Hall, on and after December 19, on payment of £5. Sealed tenders, endorsed "Public Baths," to be delivered to A. H. Aitken, town clerk, Town Hall, Accrington, not later than the time stated in the general conditions.

Dec. 21. CANTERBURY.—Alterations and extensions to the City School of Art, in St. Peter's Street, for the Education Committee. All particulars of the work may be obtained at the office A. C. Turley, A.M.I.C.E., city surveyor. Sealed

tenders for the work must be forwarded to the town clerk, Burgate Street, by 10 a.m. on Dec. 21.

Dec. 21. DUBLIN. — Extension of the goods store at Portadown Station, for the Great Northern Railway Co. (Ireland). Parties wishing to tender for the work may see the drawings and specification at the office of W. H. Mills, engineer-in-chief, Amiens Street Terminus, Dublin; or copies of them at the office of the district engineer, Belfast, and can obtain at the said offices forms of tender on payment of 1s. each (not returnable). Tenders, made out on the forms supplied by the company, should be delivered under sealed cover, endorsed "Tender for Extension of Goods Store, Portadown," to T. Morrison, secretary, secretary's office, Amiens Street, Terminus, Dublin, not later than 10 a.m. on Dec. 21.

Dec. 21. WOOLWICH.—Erection of R.A.M.C. officers' mess and quarters, Woolwich. The plans and specification may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., up till Dec. 9. A copy of the bills of quantities and form of tender may be obtained on payment of the sum of 10s. to the Director of Barrack Construction. No application will be considered if received after Dec. 11. Tenders must be addressed in sealed envelopes to the Director of Army Contracts, War Offic, Whitehall, London, S.W., and must be delivered not later than 12 o'clock noon on Dec. 21. The envelopes should be marked "Tender, R.A.M.C. Officers'-Mess, Woolwich." The bills of quantities should accompany the tender in a separate sealed envelope, similarly addressed and marked "Bills of Quantities, R.A.M.C., Officers'-Mess, Woolwich," and should bear the contractor's name and address thereon.

Dec. 22. ST. MARY CRAY.—Erection of a new council school to accommodate 300 children at St. Mary Cray, Kent, for the Kent Education Committee. Plans and specification, prepared by W. H. Robinson, committee's architect, and conditions of contract may be inspected at the offices of the committee on and after December 14, between the hours of 10 a.m. and 4 p.m. (Saturday excepted), until the time appointed for the delivery of tenders. Any person desiring to tender and to receive copy of the bills of quantities must send in his name, accompanied by a deposit of £1, to F. W. Crook, secretary, Caxton House, Westminster, S.W., not later than 10 a.m. on December 10. Tenders, on the form to be supplied with the bills of quantities, must be enclosed in a sealed envelope, endorsed "St. Mary Cray Tender," addressed and delivered to the school correspondent, G. E. Wright, Belgrave, St. Mary Cray, Kent, not later than noon on December 22.

Dec. 31. PENZANCE.—Erection of a dwelling-house and shop at South Terrace, Penzance, for G. Kettner. The drawing and specifications may be seen on application at the offices of O. Caldwell, F.R.I.B.A., architect, Victoria Square, Penzance. Tenders are to be sent to Mr. Kettner on or before Dec. 31.

Jan. 6. HEXHAM.—Erecting a new secondary school at Hexham. Contractors desirous of tendering for the work should forward particulars of their name and address to C. Williams, secretary to the Education Committee, the Moothall, Newcastle-on-Tyne, not later than December 12, accompanied by a deposit of £2 2s. for specification and bills of quantities. Plans of the work may be inspected at the Committee's Office or at the office of Oliver, Leeson and Wood, Milburn House, Newcastle-on-Tyne, and tenders endorsed "Tender for Hexham Secondary School," must be forwarded to the Secretary not later than noon on January 6.

No date. ST. HELENS.—Erection of a new monastery at St. Helens Junction. Builders and contractors desirous of tendering can have quantities and particulars from R. Curran and Son, architects, Warrington, on deposit of £2 2s.

No date. MOORTOWN.—Erection of a pair villas in Sand Hill Lane, Moortown, for Mrs. Taylor. Contractors desirous of tendering for any of the trades must send their names to Messrs. Mosley, Estate Agents, 6, Wormald Row, Leeds; and a copy of quantities will be forwarded to them in due course.

No date. LONDON, S.W.—Pulling down and materials of two houses known as "Bryan Wood" and "Stanhope House" on Wimbledon Theatre site, at the junction of the Merton and Russell Roads, Wimbledon. All materials to become the property of the pulling-down contractor. For specification, etc., apply to J. B. Mulholland, King's Theatre, Hammersmith, W.

ENGINEERING.

Dec. 14. MANCHESTER.—Supply and erection at the sewage works, Davyhulme, near Manchester, of crushing and screening plant complete, adequate for dealing with a maximum quantity of 100 tons of granite per day, for the Rivers Committee. Samples of the stone may be seen, and general conditions and stipulations of contract may be obtained, on applicaion to the secretary of the Rivers Deparment, Town Hall, Manchester Tenders must be enclosed in the official envelope provided expressly for the purpose (otherwise tender will not be considered), and delivered at the above office not later than 10 a.m. on Dec. 14

Dec. 17. BOSWYN.—Construction of a storage reservoir at Boswyn, near Camborne, together with intake works, mains, the erection of a battery of pressure filters, etc., for the Camborne Water Works, Camborne, Cornwall, in accordance with plans and specifications prepared by the company's consulting engineer. Plans may be seen, and copies of the specification, bills of quantities, and form of tender obtained at the offices of the Company between the hours of 10 a.m. and 4 p.m., on deposit of £3 3s. Uncoloured prints of the drawings may be obtained from the printers for 2s. 3d. each, upon the production of a written permit from J. Champion, secretary, such prints to be paid for by the parties tendering, and returned with the tender, by them to the secretary, or the deposit fee will be forfeited. Sealed tenders, endorsed "Tender for Boswyn Reservoir, etc., Contract No. 1," to be deposited at the Company's offices on or before Dec. 17.

ARCHITECT'S son, 10 years' office experience, wishes to take up agency or post as representative in Lancashire, or North of England, to well-known firm in any special line of Building trade. —Apply Box 4585, BUILDERS' JOURNAL Office.

AS Clerk, cashier, depot manager, or any position of trust, 11 years' experience, builder's and coal merchant's trade; age 25; good penman; also reference; moderate salary.—Box 4659, BUILDERS' JOURNAL Office.

BUILDER'S or surveyor's assistant (20), 4 years with quantity surveyor; quantities, estimating, correspondence, plans, tracings, measuring up, levelling, etc.—H. Priddle, 4, Sumatra Road, West Hampstead, N.W. 4705

BUILDER'S general foreman, advertiser seeks engagement; 16 years' service as above with first-class London firm on important and various works; good references.—Address H., 150, Effra Road, Wimbledon, S.W. 4703

BUILDER'S and Surveyor's Assistant (24), practical experience in construction and surveying; also quantities and levelling, supervision; assist estimating; draughtsman; well up in costs, accounts, wages, etc.; moderate salary.—Box 4684, BUILDERS' JOURNAL Office.

BUILDER'S or surveyor's assistant (24), 11½ years' experience; quantities, estimating, plans, accounts and prices; excellent references; moderate salary with improvement. Eastern or Southern Counties preferred.—Box 4740, BUILDERS' JOURNAL Office.

BUILDER'S general foreman disengaged. Bricklayer; experienced on large contracts. Good manager, setter-out, and measurer in all trades. Well up in p.c. and day accounts; first class references.—W. R., 64, Douglas Road, Handsworth, Birmingham. 4746

BUILDER'S Assistant disengaged, 21 years' experience; office routine, plans, specifications, quantities, supervision, measuring up, levelling, and surveying; good references; abstainer.—L. J. Greaves, Prestwood, Great Missenden, Bucks. 4717

BUILDER'S Foreman, with good London experience of all trades, seeks position of trust; estate or business firm; correspondence invited.—H., 150, Effra Road, Wimbledon, S.W. 4716

CLERK of Works, just finishing large schools, wants situation, 15 years' experience; expert timber, good all trades; plans, surveying, levelling, etc., etc. Country estate preferred.—Caswell, New Council Schools, Biddulph, Staffs. 4720

CARPENTER and Joiner (age 32) wants job. Bench, fixing, alterations, or jobbing. Could take charge if required. Good references. Life abstainer.—Pearson, 53, Hartham Road, Isleworth, W. 4681

DOMESTIC Engineer, young, energetic, thoroughly practical, seeks sit as estimating or working foreman, used to taking charge; large heating and sanitary, installation; good refs.—Box 4707, BUILDERS' JOURNAL Office.

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, BUILDERS' JOURNAL Office.

ENGINEER, general, wants permanent appointment, official or private staff; thorough all-round experience; electrical, plumbing, smith, married, 34; good testimonials.—86, Bathurst Gardens, Willesden. 4704

FIREPROOF Engineers and Concrete Specialists. Advertiser, connected with above trades for 10 years, and whose name is well known in connection with same, desires position as manager, traveller, or head clerk; first-class book-keeper; aged 33; very moderate salary.—P. W. Potter, 73, Penshurst Road, Thornton Heath. 4719

GENERAL Foreman, 30 years' experience; man of ability; good references.—Foreman, 200, Francis Road, Leyton, N.E. 4685

GENERAL foreman, shortly disengaged, just completing large schools in North Stafford; abstainer; age 34; 12 years management of men.—Burchall, Crow Lane, Earlestown, Lancs. 4666

GENERAL foreman, disengaged, thoroughly practical and reliable; 20 years' experience; new or alterations; first-class reference.—F. C., 3, Crewdson Road, Brixton, S.W. 4668

GENERAL Foreman (or foreman of carpenters and joiners, either inside or out), seeks situation. Country or colonies preferred. Good references. Age 30. Life abstainer.—A. White, 51, Alexandra Avenue, Southall, W. 4730

IMPROVER, brass-finisher, etc., requires situation, 3 years' varied experience with well-known London firm; energetic, steady, and reliable; first-class testimonials. Abstainer. — Apply Box 4550, BUILDERS' JOURNAL Office.

JUNIOR Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, BUILDERS' JOURNAL Office.

PLUMBER (26), abstainer, well up in all sanitary or lead-laying; will do piecework; town or country. Can do zinc and hot water.—W. E. B., School House, Muriel Street, Barnsbury, N. 4615

PLUMBER (Reg. by Exam.), well up in hot water and heating systems, capable of taking entire charge; 6 years' ref.; age 38.—H. P., 11, New Buildings, Hampstead, London. 4676

PLUMBING, etc., Sanitary or Lead-laying, job wanted, day or piecework; anywhere; lowest prices; best work; excellent references; used to speculating or jobbing.—Squirrell, 47a, Woodland Street, Dalston, N.E. 4749

QUANTITY Surveyor's Assistant (21), 4 years' experience, desires engagement, certificates and good references. — Apply Box 4745, BUILDERS' JOURNAL Office.

QUANTITY Surveyors.—A builder wishes to place his son (18) in above office; has had some experience. No premium, but can introduce business.—Apply H., Ashford House, Wimbledon Common. 4686

REINFORCED concrete foreman, disengaged, long and varied experience, especially in Kahn bars and expanded metal, timbering a speciality; carpenter by trade; good refs.—G. C., 59, University Road, Tooting, London. 4721

SLATE MERCHANTS AND BUILDERS' MERchants.—Experienced traveller (with 14 years' connection Midlands), desires re-engagement; at liberty middle of December; or could arrange earlier.—Address, Slate, c/o Secretary, Builders' Exchange, Sheffield. 4624

SLATING and tiling wanted (labour only) day or piece; any quantity, large or small; distance no object.—Mack, Slater and Tiler, 3, Granville Cottages Tower Hamlets Street, Dover. 4619

SHOP or General Foreman, long West-end experience, used to alterations and repairs; understands stairs; used to good jobbing work. Address A., c/o Mr. Seymour, 14, Allsop Place, Regent's Park, N.W. 4586

TO Builders.—Situation as improver wanted by young man just out of his time; technical student; neat draughtsman; assist with quantities, supervision, etc.; abstainer. — Box 4662, BUILDERS' JOURNAL Office.

TO Estate Owners.—Builder (38), varied experience, desires position as agent or clerk of works, surveys, plans, quantities, setting out, accounts and supervision; country preferred.—Box 4591, BUILDERS' JOURNAL Office.

TRAVELLER.—Architect desires post as representative to good firm. — Address Box 4497, BUILDERS' JOURNAL Office.

Appointments Vacant.

AGENT, with slight knowledge structural engineering, wanted by well known firm to introduce sale of speciality on commission, in Southampton and district, gentleman having connection among architects, surveyors, and engineers preferred — Write Reinforced Concrete, c/o Brown's Advertising Office, 17, Tothill Street, Westminster. 4732

WANTED, a young assistant for clerk of works' office; must be accustomed to plans, quantities, and pricing.—Apply to A. H. Ashdown, Uppington, Wellington, Salop, and state age, experience, and wage required. 4742

WELL educated youth, to learn routine of architect's office; some knowledge of shorthand and typing desirable; commencing salary.—E. Crosse and Co., 11, Bermondsey Square, S.E. 4713

WANTED, immediately, a first-class active all-round architect's assistant, with considerable experience in public, elementary, and secondary school planning. He must also be an expeditious draughtsman, capable of writing specifications and checking accounts. Preference given to one capable of preparing a complete bill of quantities (London system), up to at least £10,000. Salary not to exceed three guineas per week, payable monthly. Apply stating full particulars and testimonials (copies) to D. Pugh - Jones, County (School) Architect, 62, Charles Street, Cardiff. 4733

December 16, 1908. Volume 28. No 723.

New Point in Workmen's Compensation.

Attention is drawn by a correspondent to a case that was decided the other day by the Court of Appeal, and was not reported in the newspapers, but is of considerable interest to all who are in any way connected with the building trade. It lays down the law in a manner which is far from satisfactory to employers. The facts, as stated by our correspondent, were as follows:—A mill in Bradford was burned down. The Corporation purchased the site, with the bricks, etc., upon it, and invited tenders for the materials of the structure as they then stood in their damaged condition. An offer was made of £30 for the whole, the buyer pointing out that it would cost him £100 to take down and remove the materials to the site where he proposed to use them again. The usual agreement was entered into, by which the purchaser was to clear the ground and to pay £30. When the work was begun, a labourer asked for a job, and was given one upon his stating that he was used to the work. The next day, when at a height of about 60ft., he fell, and was killed. Of course under the Employers' Liability Act the employer was liable, but the widow of the labourer also in the same action sued the Bradford Corporation, alleging that they were also his employers, the man who had engaged him being only a sub-contractor, and judgment was given for the widow for an agreed sum of £170 as against the employer; but the question of the Corporation's liability to have judgment entered against them was disputed, and argued at considerable length, and in the end the judge found that the agreement specified above was not a sale of goods pure and simple, but involved a contract for service. In these circumstances, not only the employer was liable, but the Corporation also, and this decision was confirmed by the Court of Appeal without calling upon counsel for the widow. The Court of Appeal was very strongly constituted, and included Lord Justice Fletcher Moulton and Mr. Justice Cozens Hardy, who are looked upon as very strong judges. The effect of this decision is that, assuming that a person wishes a building pulled down and another erected in its place, which is to be used by him in his trade, if he employs either a builder and [or] housebreaker to pull it down, and during the course of its being done someone is killed or injured, then not only is the builder and [or] housebreaker liable, but also the person who is the principal, and who, prior to this decision, always considered himself clear of any claim. The obvious moral is that employers of builders or housebreakers should take care that they are financially strong; otherwise the principals may be called upon to pay heavy damages. Principals who are aware of this decision and of its consequences, will insist upon builders and [or] housebreakers taking out an insurance policy, covering the liability which has been thus strikingly revealed. Strange to say, this law applies to business premises only, and not to private houses.

Restoring Metz Cathedral.

Metz Cathedral is about to be very extensively restored, the Kaiser having approved of the scheme prepared by Herr Schmitz, the architect. One of the towers is to be completely reconstructed, but the old architectural features will be rigorously conserved. The principal doorway is to be fitted with massive bronze gates, which will be cast by Martin and Piltzin, of Berlin, and the decorative masonry above this doorway is to be reconstructed by Herr de Bouché, of Munich. The restoration of the great stained glass windows in the transept, now nearly finished, has been executed by Professor Geiges, of Freiburg-im-Breisgau, Baden. The chapel of the Sacred Heart is to be elaborately embellished, and altogether the restoration is to be on so extensive a scale that a writer in a Continental building paper is led to ask, "What will remain of the old Cathedral, of which the people of Metz are so proud, when all these works are executed?" The cost of the restoration is estimated at 100,000 marks.

Unregenerate Leeds.

The holding over of the Towns Planning Bill until next Session has caused unholy rejoicing at Leeds. The Bill prohibits the erection of back-to-back houses; and since 50 per cent. of the houses erected in Leeds during recent years are of this description, the unpopularity of the Bill in that delectable city is not difficult to understand. The town clerk is actively engaged in an endeavour to get the provision modified; and the postponement of the Bill will give him a breathing space which even he will be able to appreciate. The owners of such property have made frantic efforts to show that the back-to-back system is almost essential to salubrity, and that your rear-space theory is pure hypothesis, and mischievous at that, because it prevents the magnanimous property-owner from putting up dwellings that can be let at 2s. a week cheaper than any kind of decent abode. The recalcitrancy of Leeds is a rather striking indication of the value of the principle of central control embodied in the Bill. Certain localities, it is clear, like certain persons, are apt to become almost passionately addicted to peculiar idiosyncrasies, not to say vicious practices, and it is hopeless to expect reform from within. In such case it is well for the State to intervene. Leeds has a strong architectural society, and we should like to hear that it is doing something to counteract the misdirected energies of the town clerk, because, in clinging thus desperately to its darling sin, Leeds is making itself rather a sorry spectacle in the eyes of disinterested observers, who are convinced that the back-to-back system is indefensible by its mere hideousness. The hot-gospellers of housing reform may well regard Leeds as being almost past praying for.

The Law Courts Extension.

The commencement of work for the extension of the Royal Courts of Justice recalls the fact that it was the intention of the architect of the existing building, the late George Edmund Street, to erect on this very site a great tower, which was to be surrounded by subsidiary buildings. This, no doubt, would have greatly simplified the planning. His scheme, however, was frustrated by the interference and opposition of the then Law Officers and the no less meddlesome and much more ignorant First Commissioner of Works, and it was commonly said that Street was worried to death by the impossibility of realising his ideals rather than by the material obstacles that were put in his way. Four new courts are now to be erected, and these will occupy only the northern portion of the site. The new buildings have been designed by Sir Henry Tanner, of H.M. Office of Works, who may be congratulated, surely, on the existence of a wiser and milder régime than that under which Street writhed and groaned. A bridge of three arches will connect the four new courts with the court level of the old building. Portland stone will, of course, be used, to match that of the existing buildings. It is stated that very special attention is to be given to the ventilation of the new courts; and that

is apparently the only respect in which Sir Henry Tanner's work does not "enter very sympathetically into the spirit of Street's fine Gothic building," whereof the interior atmosphere, when the courts are crowded, is Gothic in the extreme.

On Roman Gardens.

In the days of the ancient kings of Rome, the gardens of the citizens usually consisted of small enclosures ornamented with a few shady trees, but otherwise not differing, in any essential respect, from modern kitchen gardens. But, with the later opulence of Rome, and the general increase of the wealth of its inhabitants, the term *Hortus* implied not the former small utilitarian enclosure, but a stately pleasure ground very similar, in style and arrangement, to that which usually surrounds a modern Italian villa. Early in the reign of Augustus, the garden of the wealthy Roman began to be planned on a magnificent scale. Where space permitted it, the ground was divided into shady avenues (*Gestationes*) for walking, and provided either with a large riding-house (*Hippodromus*) or covered roadway (*Deambulatory*), for equestrian exercise. In addition, there was a large open space (*Xystus*) the pathways of which were bordered with box and *picea*, a species of yew. Beyond the *Xystus*, a charming vista of green lawns, bounded by hedges of evergreen clipped into trim forms, or fanciful shapes, usually presented itself. Here also was placed a large marble basin to receive the streams of water which meandered through the green turf. The borders of the basin were bright with flowers and shrubs and grass plots, planted with violets, roses, and lilies, were arranged in beds enclosed by narrow paths. Beyond the basin of water, approached by an avenue of stunted trees, there was usually a pavilion or summer-house (called by Pliny "The Delight"), and sometimes there was a second pavilion, constructed wholly of marble, in which seats were arranged round a water organ of simple and ingenious mechanism. Statues of the tutelar deities were placed at the garden gates to protect the pleasure grounds from depredation, and busts and figures of illustrious men, marble seats, fountains, and grottoes, abounded in profusion.

Post-prandialism and the Painter.

Mr. E. R. E. Sutton, F.R.I.B.A., has made a subtle but unsuccessful attempt to surprise the great secret of the house painter. It happened at a dinner of the Nottingham branch of the National Association of Master House Painters. Mr. Sutton, representing the Nottingham Architectural Association, was received as an honoured guest; "instead of which" he dropped a bombshell in the midst of his trusting hosts. In proposing the toast of "The Nottingham Architectural Association," Mr. G. T. Shearman remarked on the wide and extensive knowledge required by an architect. Nottingham, he added, was known as a fair city, and it owed some of its fairness to Mr. Sutton. In responding, Mr. Sutton seemed to bend all his energies on the destruction of these amicable propositions. In the first place, he seriously discredited the "wide and extensive knowledge" theory by confessing that "there was only one thing about his profession that he did not know." This was in itself a sufficiently damaging admission; but its gravity became profound when the ulterior object in making it was revealed. "When he specified for four coats of paint, how did he know that he had got it? That was the secret he wanted them to tell him." Soho, then! this confession of ignorance on one single point was made not in real humility of spirit, but in the wily desire to take the hospitable painters off their guard. Surely, while they were in such an expansive mood, they could not refuse to render absolutely perfect the admittedly all but complete omniscience of their guest. And so it came to pass that the "fairness" attributed to Mr. Sutton was, like the extent of his knowledge, voluntarily subjected to a cruelly heavy discount. For the painters would not allow him to "sweedle" them out of their guilty secret, which, as he must well know, they are bound by a solemn compact never to reveal. Such mysteries as Mr. Sutton vainly tried to probe must for ever remain inviolably esoteric. But possibly science may not find them eternally impenetrable; for although it is not always convenient to cut out sections of the work and study the strata, it may some day possibly occur to some particularly practical-minded person to employ an incorruptible clerk of works to count the coats in the order and at the times of their succession. We wonder that, as Christmastide is so near, someone did not point out to Mr. Sutton that when three coats looked as well as four, the fourth, if applied, must surely be a waste coat.

Property and Propriety.

That eminent firm of property agents, Messrs. Blank, Dash, and Asterisk, have issued a somewhat startling manifesto. They "beg to notify that they have decided to state CLEARLY in their descriptions of property any obvious disadvantages that exist, as they feel this course is in the interests of both Vendor and Purchaser, and will often save much waste of time to all parties. To enable Messrs. Blank, Dash, and Asterisk to carry out this principle IN EVERY CASE, they further beg to announce that they will be unwilling to accept the agency of any estate should the owner object to the suggested course." Surely this is to carry frankness to the verge of knight-errantry. It is one more evidence of the renascence of chivalry, and the magnanimous example is likely to be widely followed. Indeed, it has been to some extent anticipated. We have a vague remembrance of a very floridly eloquent auctioneer who never failed to point out the defects of the property that he was offering for sale. As thus: "I do not for a moment wish you to suppose that this property is absolutely perfect. On the contrary, as a man of conscientious principle, I am bound to point out that it has two very serious disadvantages. A most annoying but not entirely irremediable nuisance arises in summer from the overpowering fragrance emanating from the extensive rosery, which, however, could without much trouble or expense be converted into a potato field. The second drawback is, I fear, insuperable. It arises from the picturesque beauty of the mansion and the charm of the scenery that surrounds it. As a not unnatural but, perhaps, deplorable consequence, the estate is constantly infested with artists. Unfortunately, to shoot them would be to rob the Royal Academy of its brightest ornaments and its best pictures. But I have now conscientiously informed you of the worst faults of the property. Take it or leave it." Any such development of the principle is assuredly not contemplated by Messrs. Blank, Dash and Asterisk, who, according to our reading of their manifesto, intend nothing more ambitious than a clear statement of the obvious. They do not mean to let any form of concealment, like a worm i' the bud, feed on their damask cheek; bearing in mind, perhaps, that a full endowment of cheek, whether or not it is qualified by an adjective, is indispensable to a property agent.

Board of Education's Fit of Modesty.

The building conditions imposed by the Board of Education do not frequently tend towards the sparing of space and expense; but apparently the Board is able, on occasion, to reverse its engines. An instance of this kind, however, is so rare as to deserve to be chronicled. At a recent meeting of Cambridge Town Council, it was stated that, in a letter received from the Board of Education, plans for proposed new schools in Melbourn Place were approved, except that "the Board were of opinion that the halls were unnecessarily large, and that it would be possible to diminish their width without affecting the arrangement of the class-rooms." It was explained that the proposed central halls would be about 60ft. long and 30ft. wide; and the architect had reported that if the width of the hall were reduced to 28ft. the consequent saving in cash would amount to no more than about £100. And so the town council chose the more expansive and more expensive way, and the disinterested economist on the Board of Education will perhaps groan in concert with the aggrieved ratepayer at the deliberate and wilful rejection of this perhaps unexampled opportunity of "saving a bit" on the suggestion of the Board of Education. "Such a magnificent offer may never be repeated," and its refusal must have a very disheartening effect on the Board, which is thus flouted at what may possibly be its first and last attempt at asking for less than a local authority is prepared to give. Yet, on the whole, the spectacle of a Government Department and a local authority engaged in a rivalry of self-denial would be rather edifying if it were not so bewilderingly topsy-turvy. One has a lurking suspicion that there may be more in it than meets the eye.

Lighting and Ventilation of Schools.

The transactions at the second International Congress on School Hygiene, held in London in 1907, are recorded in three substantial volumes, of which the first alone can be said to contain anything that is of special interest to the architect and builder; but the reports there given of Sir Aston Webb's remarks on the lighting and ventilation of class-rooms, and the summaries of papers (in French and German) on kindred subjects by M. Georges Courtois, Dr. R. Dinet, and Dr. Wilhelm Prausnitz, afford the means of interesting comparisons. In the upshot, however, one is forced to agree with the observation with which Sir Aston Webb opened the discussion: "I am afraid that there is nothing new that can be written on this subject." The necessary abridgments have been admirably done by the editors.

R.I.B.A.

THE ELEMENTS OF DESIGN IN INTERNAL DECORATION.*

Having referred to examples of the decorator's art which have come down to us from the past, the author said there was no reason why we should be complete slaves to their magnificent domination. Neither should we in any way despise the triumphs in line, form, or colour on which the ancients have set the seal of beauty. From the savage races to those which have attained to intellectual and artistic fulness we find an equal instinct and love for colour and its disposition in beautiful shapes. Why should we of the twentieth century be denied crystallisation of such figments of beauty in colour and shapes as may have drifted into the net of our most fervid moods—moods from which invention springs and an intenser clearness of vision of things lovely in themselves, of distinction in style, and sympathy with the architect's creation? In the first place there is the decoration which is entirely the architect's achievement, in more or less permanent materials, forming, not only the anatomy, but much of the clothing of his work—the design and disposition, for instance, of such materials as wood, stone, metal, marble, tiles, glass, gesso, mosaic, etc.—the unity of all this expressing his own particular art. From this single partnership great things have been accomplished, which are treasured as ideals by most students.

Limitation of Natural Objects.

The olive, the laurel, the pomegranate, the orange, the vine and its leafage, etc. —the curving festoons for horizontal shapes, the pendant for vertical shapes, and the circular wreath for telling expression at a distance—all these have had a long domination in architecture, and go to prove that there is a limited number of things in nature that can be used with success. In the way of natural forms as decorative elements, the Egyptians have shown what can be done with the lotus, the cane, and binding bands of reeds. The festoon has become in careless hands a very baggy sort of detail, generally dubbed the swag, a term which rightly indicates its debasement.

Too Much White.

The author deprecated the present fashion of painting nearly everything white. The use of white on all occasions becomes extremely monotonous, indicates a certain poverty of thought, and belongs to the transitory interest of things easily done. The full and sumptuous quality of colour in decoration seems the rarest and most difficult to attain, the predominance of primaries being essential: such schemes maintain their interest longest, mellowing rather than deteriorating in tone. As decoration the greatest triumphs in colour and design have been set within the compass of a frame; and with such examples as an incentive the standard of our work should reach higher. Lord Leighton in his "Daphnephoria" has left us one of the great decorative pictures of the world, containing as it does much of the finest elements of decoration in the procession of singing children, youths, and women, carrying the beautiful symbols of their faith through the olive groves, beyond which is seen the city of the violet crown set against the Attic sky. The landscape alone is a great decoration.

Decoration on the higher scale seems a thing of the past. What little that is done trends rather to a technique—that is, a kind of swagger of the brush—rather than to an effort to create pictorial decoration which shall be an embodiment of things beautiful. The sincerity and reverence of the primitives, though lame in technique from a modern point of view, have a more lasting interest.

Decorative Materials.

The author discussed the merits and defects of various decorative materials—marble, bronze, copper, wrought iron, etc. —and dealt at length with the treatment of gesso, gilding, friezes, carved wood, wall-coverings, heraldry, glass, sculpture, painter's work and materials, etc.

To the author there seemed great possibilities for architecture set within architecture as an adjunct in decoration. Architecture is really the basis and beginning of design, and that which it has accomplished in the creation of forms, contours, disposition of vertical and horizontal lines cannot be overlooked by those who set out to give us a great pictorial or decorative composition. When speaking of architecture within architecture the author explained that he was thinking of the beauty and fitness of many cities (if painted with a decorator's instinct) to fill with success rectangular spaces, either vertical or horizontal, which may be appointed by the architect. These cities as subjects required careful selection. Some were decorative in themselves:—for instance, Jerusalem, from the hil' of Scopus behind the Mount of Olives; Athens, from Lycabettus set against the Saronic Gulf and Peloponnesian mountains; Milan set within the Lombard plain from Bergamo; Saragossa, with the steely blue of the Pyrenees behind, as seen from the south. The point of sight should not be near, so that due justice would be given to the harmonies of the atmosphere in which they are enfolded. Accuracy of detail is important, but not so much so as a grasp of the fine contours and colour gradations in a big sort of way.

Landscape.

Landscape, too, has great decorative possibilities. There is at present a tendency to use so-called classic landscapes (made at home in which hard, strongly outlined rolling clouds, doubtful classic buildings, and large trees are set in vistas of brown tones only. A real classic landscape is a great revelation of its fitness for decoration. In the land where classic art had its birth very little rearrangement is needed. There in itself one finds composition tones and colour harmonies. Planes and values are all in order, making a refulgent yet sober composition.

Wanted, a Renaissance.

The author felt that there was an opportunity now for a great Renaissance in decorative design. Donatello, Mino de Fiesole, and other Italians with their genius achieved a personal and perfect culmination from the study of the rather limited Roman remains that were within reach. They were essentially modern, and were influenced by the fashion of the moment and ready to embody any new thought for the glorification of their work. Now, in the twentieth century, our treasures of Greek art are largely multiplied and easily available in the British Museum, and in the incomparable Parthenon frieze, the decorative bronze ornaments, coins, and hundreds of other jewels of art are shown the best qualities of dignity and restraint in design for students who have the fervour and ambition to

*Summary of paper by Mr. T. R. Spence, read before the Royal Institute of British Architects, December 14, 1908.

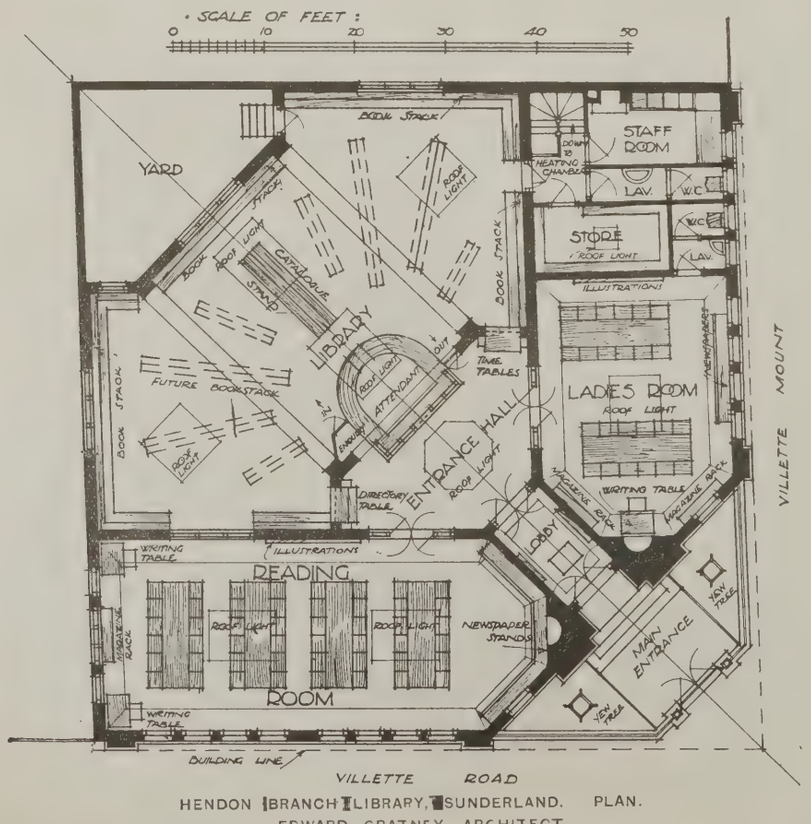
HENDON BRANCH LIBRARY, SUNDERLAND. READING ROOM.
EDWARD CRATNEY, ARCHITECT.

recreate a style that shall be on a par with, yet quite distinct from, the fourteenth-century Italians, and of a freshness and interest that cannot be evolved from a period of decadence.

The author disclaimed any intention of laying down laws for the treatment of any department, as the dimensions, schemes of lighting, etc. His impression was that design had its birth from vague memories of beautiful things seen; if careful notes were made for reference in the actual work of creation the operation meant death to the imagination.

Ornament and the spaces for its disposition needed new thoughts and careful consideration as to the disposition of lines and areas—of the separate details of the ornament— and the amount and variety of decoration already achieved by the architect in the use of mouldings, modelled forms, etc. The battle could only be fought out on the walls or spaces allotted for treatment to the decorator by the architect, and to this there was no royal road to the creation of any work of art. Consequently such creations could not grow into shape without much tribulation and strained endeavour.



THE TOWN PLANNING OF THE ROMANS—CONSTANTINOPLE.

When, after the defeat of his brother-in-law Licinius, Constantine, the Emperor of the West, reigned supreme—the sole Emperor of the Roman world—he cast about for a metropolis suitably situated for the administrative, military, and commercial requirements of his vast dominions. The city of Rome, separated by the Alps from other parts of the empire, and ill-provided with harbours, had long since ceased to be a convenient centre of government, and Constantine, above all, was desirous that his new capital, whilst being easily accessible from both land and sea, should yet be sufficiently remote from the frontiers of his realm to afford a safe residence for the imperial court. His choice of the great port of Byzantium was, in many respects, an excellent one. Indeed, no place was so well situated for dominating either Europe or Asia, or, in other respects, was better fitted to become the seat of the universal empire to which Roman ambition aspired.

The Bosphorus and the Sea of Marmora afforded easy and safe passages for the commerce of the neighbouring countries, whilst the Golden Horn, the great harbour of the city, possessed immense natural facilities for the safe accommodation of vessels, both large and small.

At Byzantium, then, in A.D. 328, the boundaries of the new city were defined, with the solemn ceremonial to which the Romans were accustomed. The Milion, or golden milestone (a small building resembling a Roman temple), whence the distances to all parts of the empire were to be measured, was placed immediately outside the walls of the old town, on the site of the market-place of the new city. Within the walls of Byzantium, on its south-eastern side, a portion of the old town, one hundred and fifty acres in extent, was chosen for the emperor's palace and pleasure grounds, the imperial precincts being shut off from the new city by a wall, commencing on the coast line, where the Bosphorus meets the Propontis, thence proceeding inland, and continuing, approximately parallel with the shore, for about one mile. West of the enclosing wall of the emperor's palace stood the Augustæum or forum.

(To be Concluded.)

BRITISH AND FRENCH BUILDINGS*

A Reply to Mr. Jemmett's "Appreciation of French Buildings."

By J. S. Gibson, F.R.I.B.A.

After listening with great pleasure to the very able essay of Mr. Jemmett on the virtues of French public buildings, I feel somewhat diffident in laying before you a few thoughts on the English buildings of similar class, but I do so in the hope that you will turn a blind eye to the defects of the speaker, and a keen one upon the many excellencies of the subject I have the honour to lay before you.

Our National Characteristics.

Our consideration of the matter should be treated on general broad lines. We should endeavour to ascertain the motives that lie behind all achievements in public building, irrespective of "style," and it is only by looking at this subject from a philosophic standpoint that we can obtain any beneficial results.

Our national characteristics may be summarised as follows:—Independence of mind and judgment; a marked individuality; modest unostentatiousness; keen commercialism; businesslike economy; and it will be found that these qualities are reflected in our architecture. The fact that we are an island people with world-wide interests has moulded us in this way, and we cannot escape the consequences of our environment.

Just consider for a moment the immense value of a strongly developed spirit of independence, active and eager in research into the heights and depths of styles and traditions, but relying on strength of character to form conclusions that will help on the progress of art.

In these days, when the development of the architectural work in Europe is as clear to us as the work in England, when we can analyse the trend of effort on the part of our Continental confreres, in the same way as we may do that of our fellow-architects at home, and when we can weigh these efforts in the delicate balance of the mind, and sift the live architecture from the dead mask, how valuable is that independence of analysis and judgment!

Independence of Mind and Individuality of Treatment.

It is this very independence which saves us from the deadly monotony of "schools" and "periods" and "styles," from the cut-and-dried classification of architecture according to historical dates.

This independence of mind is reflected in the marked individuality which is to be found in all English work, and produces that diversity of treatment which gives to our buildings unexpected charm and variety.

This grace of individuality of treatment saves English architects from the deadly formalism of Classic styles, which in their purity are no longer applicable to modern requirements, and we have realised that it is foolish to expect twentieth-century men to fit themselves to the austere rigidities of Greek temples or the ponderous picturesqueness of Gothic masonry.

Developments Present and to Come.

But the formalism of the Classic and the picturesqueness of the Gothic works have passed through the crucible of the modern mind so as to yield a pliability of treatment of architectural forms that is stamped with the individuality of the author, and from which much greater developments may be hoped for and reasonably expected. Perhaps when some great master mind gathers up all these scattered efforts, and welds them into one harmonious structure, we shall then see how much further we have succeeded in our real appreciation of architecture than is at present apparent.

Imitation may be the sincerest form of flattery, but it would not be flattery to say

*Paper read oy Mr. J. S. Gibson, F.R.I.B.A., in the Architectural Association Debating Section on November 27th, 1908. This paper is a reply to that which was read at the same meeting by Mr. A. R. Jemmett, F.R.I.B.A., printed in our issue of December 9th.

that imitations of the forms of architecture will ever produce works that will be interesting or individualistic.

British Reticence of Expression.

Again, we find that the national characteristic of modesty, especially in public display, pervades the spirit of our architecture; and although we may be a nation of shopkeepers, we do not put all our goods in the shop windows. This modesty conduces to a reticence of expression in public buildings that might be taken for baldness or lack of imagination; but its very quietness constitutes a great charm, and we generally find, as we grow older, that the simpler buildings appeal to us the most, and satisfy us best.

"Thrift, Thrift, Horatio."

The commercialism of the Englishman, and perhaps in a more marked degree, the thriftiness of the saving Scotsman, is usually hurtful to the architecture of our public buildings, in that the surroundings of the buildings are hardly ever considered in relation to the building itself. We are thus often like a man who owns a beautiful picture and is worse than careless as to whether it is framed or not. But while it is true that almost any site is apparently good enough for a public building so long as it is cheap, this very defect has produced in the architect a capacity to design on difficult and awkwardly shaped sites buildings that are admirably adapted for public purposes.

Where the British Architect Scores.

In the matter of compact planning, admirably lighted and healthful buildings, I am sure the English architect is a long way ahead of his Continental brethren. This very quality has reacted on the client, so that he does not now realise what ceremonious planning means, until he goes abroad and sees the grand lay-out of a big public building.

The Glories of the Irregular Site.

When you consider the wonderful skill and ingenuity which must have been required to plan the Manchester Town Hall, with its myriad rooms of varying dimensions, on a much too small triangular site, and with what success has all this been achieved, it is hardly to be wondered that town hall sites all over the country have been selected because of their irregularity rather than because of their suitability.

The client is so satisfied by the business-like economy of means to ends, the saving of the public time and energy by the elimination of ceremonial halls, stairs and entrances, that it is scarcely surprising if we too begin to question whether these things really add to the joy of living.

The Spirit and the Form.

The architecture of our public buildings may be said to epitomise the national characteristics in so far as these can be translated into brick and stone, and will be found to be almost the exact opposite of the qualities found in similar buildings of the French class; and I maintain that these characteristics tend to keep alive the spirit of architecture as distinct from the form and that development along the lines of English practice means progress in evolving a type of building which shall be found suitable to modern needs and expressive of modern thought.

Architecture must express abstract ideas, else it is only copybook stuff and of no value. I do not mean that the fronts or decorative works alone should express abstract ideas, but that these shall be manifest in the whole conception and lay-out of the building. The economy of money, of time, of energy are our dominant characteristics, and these will be shown in the tightness of planning, the direct routes, the absence of grand stairs, just as clearly as in the omission of useless columns and pediments and carved swags and pendants.

We may never be able to evolve a new "style" which can be labelled and differentiated from those preceding it, and I hope it will be many years before we attempt to do any such foolish thing; but I trust we shall never forget that it is the thought embedded in the style which matters. The style represents merely the words of the language, giving expression to the thought, and though some may be wonderful word painters, it is much greater to be an originator of thoughts that go on expanding and fructifying through the years.

Theatrical Effects.

In the study of French public buildings, one is convinced that they are largely laid out with an eye to scenic effect, and the modern buildings have a certain air of unreality that also savours of the theatre.

I grant that they have a symmetry of treatment and a ceremonial lay-out of environment, a certain spaciousness of halls and stairs and entrances that suggests receptions to be enjoyed rather than business to be done.

But we cannot always be decked in purple and fine linen, and these classical facades make but an indifferent background for the ordinary garb of the ordnary man on his ordinary day. Besides, I shrewdly suspect that there is not that intimate relationship between the plans of these structures and the work to be daily accomplished in them as will be found in similar English buildings. And therein lies a grave danger to architecture; for if the conception of the plan is subservient to a scenic display of architectural features, however admirable, the spirit of art will soon be lost, and the work become lifeless and uninteresting.

Our Plate.

Hendon Branch Library, Sunderland.

The building has been planned with a view to working the library with as small a staff as possible. The principal rooms are grouped round the entrance hall, and consist of lending library, general reading room, and ladies' room, with the usual complement of staff rooms, stores, etc.

The delivery counter is so placed that the librarian has direct supervision of each department. The library will be arranged on the "safe-guarded" open access system. The elevations are designed in a quiet treatment of Free Renaissance. The walls are built of Windy Nook stone dressings, and the roof covered with blue Welsh slates. The floors of the main rooms are laid with maple wood blocks. The whole of the interior fittings are executed in oak. The building was designed by and carried out under the supervision of Mr. Edward Cratney, architect, of Messrs. Davidson and Cratney, of Wallsend and Sunderland, the contractors being Mr. Joseph Huntley and the stonemasons Messrs. McMillan and Son, both of Sunderland, and the carving was executed by Mr. Christian Neusser, of Newcastle. Mr. T. Cooke was Clerk of Works.

The whole of the fittings and fixtures have been designed by the architect, whose design was selected in competition.

Notes and News.

A crematorium for Edinburgh is proposed. The cost suggested is about £2,500.

* * *

"The Irish Builder and Engineer," which was established in 1859, will celebrate its jubilee, in March 1909, by issuing a special edition de luxe, which is to contain "a comprehensive retrospect of the past fifty years." The offices are at 34, Lower Abbey Street, Dublin.

* * *

The proposed Bunyan memorial for Westminster Abbey is now taking definite shape. At the last meeting of the committee, designs for a window were submitted by Mr. J. N. Comper, the artist appointed by the Dean of Westminster, and were approved. The scenes selected for the two main openings are:—Christian's meeting with Evangelist; his admittance at the Wicket-gate; his deliverance from the burden of sin at the foot of the Cross; Mr. Interpreter's house; Piety, Prudence, and Charity harnessing him in armour of proof; his fight with Apollyon; Vanity Fair; and crossing the river to the Celestial City. The headlight will depict Christian's entrance into the city, and his joyous reception there. Round the centre panels will run a series of vignettes representing minor scenes in the allegory.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Dec. 19	WHITTINGHAM. ANNEXE TO ASYLUM FOR PAUPER LUNATICS, for the Lancashire Asylums Board. Limited to Architects who are in practice and are ratepayers in the County of Lancashire. The new building is to accommodate 700 Inmates. Premiums of £100, £50, and £25. Particulars and plan of site from Leonard Colman, Law Clerk to Committee of Visitors, 8, Lune Street, Preston. Deposit £5 5s.
Dec. 31	*CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50, £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council, Bodmin. Deposit, £1 1s.
1909 Mar. 17.	NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3,500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council. Stanley S.O., Co. Durham.
No date.	SWINTON. New Schools in Cromwell Road for the Swinton and Pendlebury U.D.C. Limited to Architects having offices within ten miles of Manchester. Premiums of £50, £25, and £10. Instructions may be obtained by letter on or before November 5th, to W. T. Postlethwaite, Council Offices, Swinton, Manchester.

** This competition has been unfavourably reported upon by Correspondents.*

Law Cases.

Railway Carriage as Sanatorium.

Judgment has been delivered by Justices Bigham and Walton, in the Divisional Court of the King's Bench Division, in the case of Harahan v. the Leigh-on-Sea Urban District Council, in which plaintiff appealed against the decision of Judge Tindal Atkinson, in the South-end-on-Sea County Court.—Mr. Justice Walton said that although the question arose out of a small matter, on the other hand, it was quite plain that the decision which they were to give expression to would have far-reaching effects. The facts, briefly, were that the appellant, having a daughter suffering from consumption purchased an old railway carriage, which he placed on an open space. For the purpose of making it a comfortable little dwelling-house, Mr. Harahan took away the seats, cut a hole in the partition, and erected a stove, etc. He submitted no plans, and for that reason the Urban District Council issued a summons against him. He was fined, and later the Council's employees appeared and pulled down the whole structure.—Mr. Harahan sued the council for damages. The council contended that the building, being a new one under the Public Health Act, according to their by-laws, they were entitled to act as they did, and the appellant submitted that, while the council were entitled in law to remove any new work that he had carried out in the structure, they had no power to go further. The County Court judge decided in favour of the council. Mr. Justice Walton added that he was impressed by the extraordinary consequences which were possible if they upheld that in a case like that the urban authority had power to remove the whole structure, but as they read the by-laws and Act he thought the decision of the County Court judge must be upheld, and the appeal dismissed.—An application for permission to appeal was granted.

An Honourable Issue.

At the London Bankruptcy Court on Friday, December 4th, Mr. Edmund P. Milne, heating and hot water engineer, of 15, Craven Street London, W.C., was granted his immediate discharge from the bankruptcy petition which he filed in July last. Nearly two years ago Mr. Milne was obliged to commence an action in the High Court for the recovery of the balance of a contract due to him, amounting to £370. The case occupied fifteen months in preparation, and was eighteen days before the Court, as it was necesary to produce a large amount of technical evidence as to the efficiency of Mr. Milne's special boilers for combined heating and domestic supply. Mr. Milne's contention was that after his work was completed a defect arose in the chimney, which destroyed the power of his furnace. In the end judgment was given against Mr. Milne, with costs amounting to nearly £3,000. Mr. Milne at once realised that his only course was to file his petition, from which he has now received his discharge, owing in a great measure to the almost unanimous desire of his creditors. He has now resumed his business, which for the last five months had been temporarily suspended.

Views and Reviews.

Elementary Manual of Building Inspection.*

Mr. W. R. Purchase, who is no novice in the authorship of technical books, has produced yet another that is likely to be very serviceable and successful. It is a handy manual in which the whole duty of building inspectors is set forth clearly and tersely. It is the result of attentive observation and practical experience acquired by the author both as builder and as building inspector. It is modestly stated that "this little work has been compiled for students engaged in the supervision and conduct of building work, and also for craftsmen who contemplate becoming inspectors." We should suppose it to fulfil this purpose very well indeed, and to possess the additional virtue of showing architects and builders their work as seen from the inspector's point of view. The book should have had an index; and the promise of "nine plates" given on the title-page is hardly fulfilled. There are, it is true, nine pages of diagrams, but these are all printed on both sides, and, strictly speaking, are therefore disqualified from taking rank as plates.

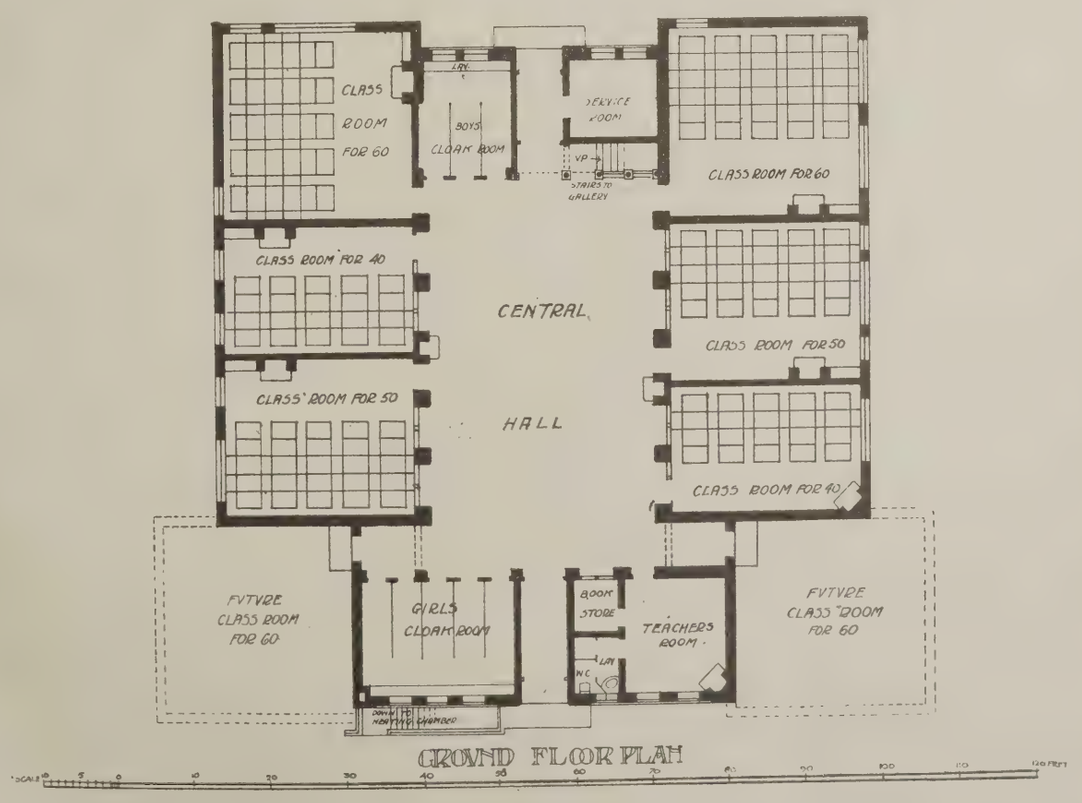
*Elementary Manual of Building Inspection; or, How to Become a Building Inspector. By William R. Purchase, building inspector to the Borough of Hove. With nine plates. London: Crosby Lockwood and Son, 7, Stationers' Hall Court, Ludgate Hill. 2s. 6d. net.

A Practical Work on Timber.

Steel-frame and reinforced concrete construction being at the present day so conspicuous, a kind of hazy idea is current that timber is becoming obsolete. Evidently the author of this book fears the possible injuriousness of such an impression, for he makes haste to correct it, his very first sentence being, "A new work on timber may by some be considered of questionable value, for do we not live in the 'steel age'?" As evidence that we do, he cites the celebrated case of the sky-scraper of forty-seven storeys erected in New York for the Singer Sewing Machine Company, in the which monstrous edifice not a single cubic foot of timber enters into the permanent construction. On the other hand, there is the serious complaint that the world's timber supply is being wastefully exhausted; and it is shown that the import into this country increases every year. Most of it is used for telegraph poles, railway sleepers, and street paving, while the enormous consumption in papermaking is indicated by the statement that the average daily circulation of a popular halfpenny newspaper requires 200 trees for pulp. Even in reinforced concrete work, a large amount of timber is put to temporary use. Timber, therefore, still demands study and attention, and the author is well advised in quoting this passage from Mr. T. G. Jackson's "Reason in Architecture": "All experience hitherto tends to show that an architect who wishes his building to go down to posterity will do wisely to let iron play as small a part in his construction as possible." Apparently the American architect is careless as to whether his sky-scraper goes down to posterity. He would probably prefer it to go up to infinity or down to the antipodes; but since Mr. Jackson's advice is likely to be followed for many a long year in our country, a thoroughly trustworthy and very interesting though intensely practical book on timber, such as this appears to be, is pretty well assured of a wide welcome. Not being a mere botanical list, it does not pretend to be exhaustive, and it is on that account of all the more use to practical men, who will find in it very little that is extraneous to what they want to know, while the information that they really desire is sufficiently full, and its authenticity appears to have been very carefully ascertained. Fully a third of the book is occupied with useful description and discussion of such eminently practical matters as the causes of decay, the various processes of seasoning, the different defects to which timber is liable, and the strength and testing of timber. The half-tone and other engravings are excellent.

"Timber."—By J. R. Baterden, Assoc.M.Inst.C.E. London: Archibald Constable and Co., Ltd., 10, Orange Street, Leicester Square, W.C. 6s. net.

STRENGTH AND MATERIALS.



A good many books have been published on the subject of applied mechanics, and the strength and resistance of materials. Upon the former subject, perhaps, the best and standard works are by Professor Goodman, the late Professor Rankine, Professor Parry, Professors Alexander and Thompson, with the book on framed structures by Professors Johnson, Bryan, and Turneaure, and also the books on stresses in trusses and arched ribs and bridges by Professor Burr, and on bridge construction by Professor Fidler. On the subject of the strength of materials the only books in the English language that are important are the American ones by Professor Johnson, Professor Mansfield Merriman, and Professor Martens, with the English works of Professor Unwin and Professor Ewing. In addition to these authorities we cannot omit to mention the very important work of Professor Bauschinger, whose results, unfortunately, are not readily available, and have not been fully translated into English.

Notwithstanding these works on both aspects of engineering, there has been room for several works, one upon the materials, more with relation to applied mechanics, and one upon applied mechanics, that shall treat the subject thoroughly, theoretically and practically, and bring the other books up-to-date, and a third which will do the same for the subject of materials, but, at the same time,

CHILDREN'S HOMES SCHOOL BUILDING, CHIPPING ONGAR. W. FINCH, ARCHITECT.

This building provides class-room accommodation for 300 children, with hall and cloak-rooms for a further 120 ; space being arranged for the future addition of two large class-rooms. The building was erected by Messrs. F. and E. Davey, Ltd., of Southend-on-Sea, from the designs of Mr. W. Finch, of 76, Finsbury Pavement, E.C., and is in connection with the Children's Homes built by the Guardians of the Hackney Union upon adjoining land.

gather together the whole data available. It is only the first gap which the author of the work now under review sets himself out to fill. Professor Morley has done his work well on the whole. He has explained the elementary theory in a concise and clear manner, and has not been deterred by any defects in elaborate and awkward problems. The result is, that his work is of greater practical utility to the engineer than perhaps any earlier work, though we still think Professor Johnson's volume extremely valuable because of its collection of data and clearness of explanation, while Professor Ewing, on the other hand, to some extent sums up the matter more shortly, while covering almost as great a range in each field.

The book is deserving of all praise, and though we wish Professor Morley had gone further, it is only because he has done so well that we ask for more. The book is intended as a text book for students, and a large number of examples are given. These make the book larger than otherwise would be the case, but they do not interfere with the handiness of the volume.

Mr. Morley has not ignored reinforced concrete, and he has gone into points which have been cleared up a great deal by investigations abroad. His treatment of the theory of beams is extremely clear, and goes much further than we have seen in any other text book. We feel, however, that he might have made it clearer by dealing with the moment of inertia by following the diagrammatic methods of Professors Alexander and Thompson.

In analysing the stresses of beams he has gone very fully into the subject of shear stresses on inclined planes and the deflection of beams. There are one or two problems we should like to see dealt with. One is the bending moment on a beam fixed at the ends with a distributed load gradually increasing from one end to the other. Another is the stresses in a member subjected to tension and a bending moment at the same time. Shear stresses in composite beams of reinforced concrete or other materials form another useful subject, the intricacy of which might lead Professor Morley to offer a great help to students and engineers.

He deals with the subject of flat plates, but there has been insufficient investigation in this direction; we feel, therefore, he has not been able to provide us with so satisfactory an explanation of all the problems as we hope to see, possibly in the near future.

Pipes, cylinders, and discs form intricate subjects, but they have been dealt with admirably. The problems presented by chimney construction might, however, be dealt with in future editions. Curved bars, arches, etc., are well dealt with in a short chapter, and the volume is concluded by a description of testing machines. The latter, however, is largely occupied by the description of English machines, with an account also of the Riehl machine. In all cases the machines dealt with do not go beyond 50 tons actual load; a machine of this capacity is nowhere near sufficient for civil engineers' work, and a 200-ton machine should, at least, have been dealt with. The English machines are fairly good, but we rather prefer the Continental machine made by Amsler-Laffon, which seems more convenient and accurate. We are glad the author illustrates machines that test specimens vertically; any machine which tests specimens horizontally, in our opinion, suffers from a great disadvantage in compression tests, for it introduces the stresses of bending, and the test is in no way allied to practice. It is a pity that there are no very large vertical testing machines in this country. What engineers require is a machine which shall at least be able to take steel or reinforced concrete columns 18in. square by 20ft. long, and tests ought to be conducted on struts of very large size. Since the Quebec disaster attention has been directed to this matter in the United States, but it seems unfortunate that we should not make any experiments in such an important subject in this country. Unfortunately, our methods in this direction are not at all to be commended.

The book by Professor Morley marks an advance in the theoretical treatment of the subject. It includes much original treatment, and gathers together the results of recent investigation. The subject is made much more clear than it was before, and Professor Morley has kept in view the practical problems, so that his work will be valuable to engineers, as well as serving as an excellent text book for University and similar examinations on the subject of the strength of materials.

We hope that before many years have passed we shall have to welcome an elaborate volume from his pen on the subject of applied mechanics. It is hoped that his patient and painstaking investigation will be copied by other writers, and that some engineer will be good enough to collect together for use in one volume all the data on materials and tests on construction in some such ideal way as was done for chemistry in the revised edition of Watt's Dictionary of Chemistry. It is a gigantic undertaking, but it ought to be done, for the subject of engineering is very important to the community at large.

"Strength of Materials," by Arthur Morley, M.Sc., M.I.Mech.E. (Longmans, Green and Co.; price 7s. 6d. net.)

Correspondence.

The Proposed Guild of Architects' Assistants.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read with the greatest interest the article in your issue of December 2nd, on the present position of architects' assistants. It is a convincing proof that the social status of those entering our profession is deteriorating. As the writer truly says, in the last generation assistants all looked forward to becoming practitioners; and as the ablest young man has to wait some little while after he starts in practice before he becomes self-supporting, he must—as in all businesses—have some capital, and probably few professions require more than that of architecture. I believe there are very few assistants of a good social class who are unemployed, while there are hundreds looking for berths who are without means, and spring from a class unlikely to meet persons of the "client" class. Also I have found that those who have prospects of one day practising are keener in their work, and make more useful assistants than those without that hope. I believe the Architects' Benevolent Society's records would prove how difficult it is for a middle-aged or elderly man to earn a living as an assistant when once he is thrown on his own resources, an event which may happen at any time through no fault of his own, but frequently in consequence of his employer's death. I do not think there is any necessity for the formation of another society. The work suggested in the article could be well done by the Architectural Association, although the energies of that body are largely absorbed in helping to increase the present depression in our profession. Any increase in the paltry salaries earned by assistants which could be obtained by a quasi-trade-union must be preceded by a general increase in the fees obtained by the principals, and that can only come by registration. I will conclude by emphasising the importance of all those, and only those entering the profession having sufficient connection and capital to enable them to become practitioners, and by warning them that the life of a middle-aged assistant is not worth any man's while.

ARCHITECT.

London, E.C.

SIR,—I have been reading with great interest the articles and letters appearing in your columns on the above subject, and Mr. Dixon's last article in your issue of December 2nd has convinced me that the time is ripe for some practical measures to be taken to bind more closely together the large number of architects' assistants in the country for their mutual help and betterment.

Mr. Dixon strikes the correct note when he says that there is an ever-widening breach between architects in practice and the mass of assistants, the result of the stress of modern industrial conditions, and this means that their respective interests are liable to diverge and sometimes to clash. This should not be so. Both should work together for the general advancement of the architectural profession. There is an increasing number of assistants who have either no hope or no opportunity of obtaining a practice for themselves, and it is this circumstance which makes the present time more suitable than the past for combined movement. Again, as Mr. Dixon says, the movement must be distinct from a trade union, for it is not to be considered as the assistants' interests against the employer, but the union of the two interests for the good of the Art in general. In many respects the assistant to-day has to submit to ungenerous treatment, and in a majority of cases has to accept a most inadequate salary, and as a result does not feel the interest in his profession which he otherwise would. It is also most disheartening for a young man, after going through his articles, to find that he is expected to know shorthand and typewriting, and to accept a salary of 10s. or 15s. a week. The older men, too, have their grievances in many cases, which could easily be remedied by united action.

To return, however, to the formation of a guild, as suggested by Mr. Dixon. To launch such a scheme successfully, someone or some few must begin it, and work it. Should Mr. Dixon have formed any idea of carrying his scheme into practice, I suggest that the time is ripe for him to advance it, and I feel sure he can be certain of help from others to bring it into being. Should Mr. Dixon not desire to, or not be prepared to initiate some working scheme (and I think he is the one whom we should look to for such) then, with all deference to him, I would put before your readers some suggestions as to how it might be started. At the same time, I am prepared to co-operate with anyone who will undertake to set some machinery in motion on other lines.

My ideas, then, may be summed up as

follows. I may here say, Mr. Editor, that you could lend most valuable aid to the movement in your columns. The primary consideration is, then, "How many assistants would be willing to join such a Guild?" and preliminary steps must be taken to ascertain this. I propose that a few enthusiasts should announce through your columns their willingness to form a temporary committee, and should appoint one of their number as hon. secretary *pro tem.* They should have a number of leaflets printed embodying certain questions, etc., as outlined below, and each member of this temporary committee should subscribe a few shillings, sufficient to cover the expense of printing and of your inserting one in each copy of a weekly issue of the BUILDERS' JOURNAL. This would bring the matter prominently before a large number of assistants, and by attaching a reply form to the enquiry leaflet, addressed to the secretary, those in favour of the movement could signify their approval, and an approximate idea could be thus obtained of the number who would join.

I suggest that the leaflet should take the following form:—

1.—Are you willing to join a Guild of Architects' Assistants for the general betterment of their professional status, and the advancement of the interests of the profession in general?

The Guild, when formed, would endeavour to deal with such questions as the payment of fair salaries, with possibly a minimum, no unsalaried assistants, no employment of clerks for improvers' work, the number of pupils in an office, the sharing of the chief assistants in percentages, etc. Further, a fund for unemployed assistants could be formed.

The Guild would consist of different grades, according to the standing of the person joining, each with its particular obligations and advantages.

2.—Would you subscribe, say, 2s. 6d. towards forming a nucleus fund for the necessary expenses attendant on the inauguration of such a movement?

This form, of course, would have to be modified by the committee, and is only a rough idea at present.

Should this be favourably received, there ought surely to be 800 replies, and this would mean £100 promised. With this in hand, a proper representative committee could be formed, a secretary appointed, and steps taken to put the Guild on a firm basis in the usual manner.

It remains then, Mr. Editor, for such of your readers as are enamoured of the idea to send you their names as willing subscribers to a preliminary fund. They ought also to add whom they would like to act as secretary *pro tem.*, and their names could then be sent direct to this person, and between them the preliminary enquiry form could be drawn up for distribution.

It is difficult, of course, for anyone to choose whom he would like to act as secretary, for at first no one would know the others. But if the names of the willing subscribers are sent to you, Mr. Editor, and forwarded to me, I would willingly undertake to communicate with each one, and get his views of a secretary, and thus inform each who his fellow subscribers were.

I trust this letter will have some result, even if only criticism. I am willing to do all I can to forward such a movement.

ASSISTANT.

PROPOSED NEW LONDON SESSIONS HOUSE.

The Local Government, Records, and Museums Committee of the London County Council have submitted an important proposal to provide a new building in London for transacting the business of the quarter sessions of the county. The committee state that several sites for a new Court House had been rejected on the ground of cost or unsuitability. Of all the sites available the committee are of opinion that the most suitable at a reasonable cost is that belonging to the Foundling Hospital estate, having frontages in Hunter Street, Handel Street, Compton Street and Kenton Street, Bloomsbury. The site has an area of about 54,300 ft. super. The freehold cannot be obtained, but the owners are willing to grant the Council a 999 years' lease for the whole site at a rent of £1,000 a year on the payment of a premium of £5,000 subject to the lease, but with the benefit of the rents amounting to £200 a year for an unexpired term of 73 years arising from a portion of the site, which, although not now needed, might be useful for any future extension. The proposed expenditure on capital account for providing the new Court House in accordance with the requirements of the Standing Joint Committee is estimated at £87,690—for building £82,190, and for equipment £5,500. It is expected that this expenditure will be spread over the next four years. The committee make recommendations in accordance with their report, and the Finance Committee, concurring in the proposal, submit estimates for the premium and the necessary preliminary expenses.

A carved oak pulpit that has been placed in the church of St. John the Baptist, Newport, Mon., has been designed in fifteenth-century Gothic style by Mr. Frederick R. Kempson, F.R.I.B.A., of Cardiff.

* * *

The Danish Minister of Public Works has submitted to the Rigsdag a Bill authorising the construction of a bridge between the islands of Zeeland and Falster. The construction of this bridge, and the formation of a new railway between Kjoge and Copenhagen, would greatly increase the facilities of communication between Scandinavia and Continental Europe. The bridge is to be about two miles and a half long, with a movable central section to admit of the passage of vessels. The cost is estimated at about £400,000.

Trade and Craft.

Messrs. G. B. Kent and Sons, Ltd., of 75, Farringdon Road, E.C., and elsewhere, have just purchased the entire stock and goodwill of the old-established brush and painting brush business of Messrs. Gawdery & Son, 8, George St., Minories, E.C., and are transferring the manufacture of Messrs. Gawdery's patterns and orders to their own factories at Victoria Park and Hemel Hempstead.

We are further informed that this firm, which is now in the 132nd year of its existence, is, in the early part of 1909, going to open an up-to-date painting brush factory in Australia. Mr. Arthur Kent, chairman of the company, has already sailed in the s.s. "Arabia" for India, and, after spending a month in India, will proceed to Australia, and superintend the arrangements of the new factory in Melbourne. Several hands, and the manager of this branch, are sailing, at the end of December to meet Mr. Kent on his arrival in Melbourne.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
The querist's name and address must always be given, not necessarily for publication.
Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

District Surveyor's Fees for New Drainage Work.

LONDON, N.—CAMERON writes: "I shall be glad to know whether a district surveyor can claim a fee for new drainage to old buildings? No structural alteration has occurred, nor has any brickwork been used excepting only to the manholes."

Certainly the district surveyor can claim fees for any new drainage work done, whether there is much structural alteration or not.

Book on Reinforced Concrete Construction.

LONDON, W.C.—Q.S. writes: "Kindly let me know of a useful and inexpensive book on reinforced concrete construction."

We would recomend Marsh and Dunn's "Manual of Reinforced oncrete," 7s. 6d. net, from these offices.

Door with Spring Joists.

ESSEX.—X.Y.Z. writes: "Kindly describe the best way of dealing with a door where the joints have all opened in consequence of the wood not being properly seasoned. Is it any use taking down and reframing again after it has hung for a few months?"

We do not know of any way of dealing with the door in the condition you name. It might be taken down and reframed again if you are are satisfied that it is thoroughly seasoned. Probably the expense of doing this would be as great as that of putting in a new door.

Concert Hall Construction.

"What are the sources of the best information on concert halls, assembly rooms, and theatres? The querist would particularly like to have the names of any corn exchanges which are used for concerts and theatrical entertainments."

There appears to be very little published information on the subject, the most important being Mr. E. O. Sachs's "Modern Opera Houses and Theatres" (3 vols. folio, published by Mr. B. T. Batsford, at 15 guineas nett), which contains some 600 plans and diagrams. Plans of concert halls and assembly rooms may occasionally be found in the professional Press. The New Colston Hall at Bristol was thus illustrated in vol. ix. of the "Architectural Review," and the concert room at Bath in vol. xviii. The regulations issued by the London County Council as to places of entertainment, though, of course, only in force in the County of London, form a very good guide for general use. They may be obtained from P. S. King and Co., Great Smith Street, Westminster, S.W. Many corn exchanges are used for concert and theatrical entertainments without being specially well adapted to the purpose. The one at Chichester is so used. Gloucester Corn Exchange, in Southgate Street, has a hall used for entertainments, and the combina-

tion market at Barnstaple (Devon) is similarly provided. G.

[It may possibly be of interest to note that the old corn exchange at Kirkcaldy has just been converted into a theatre, accommodating 1,500 people.—ED.]

Village Sanitation.

With respect to the enquiry and reply under this heading on p. 415 of our issue of November 25th, the manager of the sanitary department of the Leeds Fireclay Co., Ltd., 2 and 3, Norfolk Street, Strand, W.C., forwards an illustrated leaflet showing "a sanitary rearrangement of an old-fashioned insanitary method." It is claimed that by the use of the company's patent dry-closet casing, which is made of highly-glazed fireclay or stoneware, the dry-closet system is brought into line with the sanitary ideas of the present day. It was the old wooden casing, which, becoming foul through spilling or leakage, was really the most objectionable part of the system: but a casing made of highly glazed fireclay or stoneware can be easily cleansed, and relieves the very useful earth-closet system of a disqualification that was not inherent to it.

Books on Dairy Construction.

TUXFORD, NOTTS.—J. B. R. writes: "Please recommend a book on dairies, specifying floors, ventilation, and heating."

You will find the leading principles of dairy construction dealt with in "Specification," and all books on farm building construction treat on the subject. The two books I have in my office are Scott's "Farm Buildings" (Weales' Series), published by Crosby, Lockwood and Co. at 2s.; and Clark's "Farm Buildings," published at the "Hampshire Observer" Office, Winchester. The latter costs 5s., I think, but goes a little more deeply into the arrangement of machinery, etc., than does the former. F.S.I.

Constructing Roller Skating Rink.

NORFOLK.—C. R. writes: "Kingly inform me the cheapest flooring that could be used for a roller skating rink; also the size and shape required to accommodate about fifty persons."

We are advised that the cheapest flooring for a roller skating rink is asphalt, and that the shape should be oblong, giving as much length as possible without making the place unduly narrow. There is no exact size for accommodating fifty people. The larger the rink, of course, the more satisfactory it will be found. It should not in any case, however, be less than 75ft. by 3ft.

Bleaching Fumed Oak.

R.G.M.—EALING, W., writes: Would you kindly let me know some method of bleaching (a) fumed oak, and (b) stained oak, which are too dark and require lightening in colour.

You can bleach these woods by using a solution of chloride of lime and washing soda, provided that the wood has not been polished or varnished. If it has it would be advisable to remove the coating by applying such a varnish remover as "Pintoff," made by Messrs. Holzapfels, Ltd., Millburn House, Newcastle-on-Tyne, or "Pyrol," made by Farquhar and Gill, North of Scotland Works, Aberdeen. This, when applied to a varnished surface very quickly renders it in a condition to cause the varnish to be removed on the application of a scraper or, better still, engineer's cotton waste dipped in turpentine. The bleaching of the wood may be effected as stated by a mixture of chloride of lime and washing soda in the proportion of 2lbs. of the former to ¼lb. of the latter, about 2½ gallons of water will be required to bring these materials in solution. Apply with a fibre brush, not a bristle, and keep the work well saturated until the bleaching is carried forward to a sufficient degree: then thoroughly rince with water. Oxalic acid may be employed for the same purpose and in the same way, but this is a deadly poison and should only be used under very stringent conditions. The bleaching proposed may result in a grey appearance, and this can be removed by a subsequent staining of the oak to the required degree of intensity.

Works in Progress and Completed.

Athy.—At the last meeting of the Rural Council, referring to labourers' cottages, Mr. Hurley, engineer to the Council, wrote saying he had enough work in hands to keep him going for five years, when the chairman suggested help should be got if necessary.

Bradford.—The improvement scheme for the Langlands area will cost, for the erection of the new tenement dwellings, £14,473, this being the grand total of the various tenders. The excavation and other preliminary work is now nearly complete. The plans were drawn years ago by Mr. F. E. P. Edwards, the then city architect.

Cardiff.—It is reported that the building trade here is now very brisk. The corporation works committee, at their last meeting, passed plans for seventy-three new houses, while the Llandaff Council has just passed plans for forty-five new houses at Whitchurch, Llandaff and Llanishen.

Chester.—The town council have held a special meeting at which contracts were accepted for various new undertakings that are being pressed forward in the interests of the unemployed. The new works, which include the building of two new schools, are estimated to cost £18,000. Various street works are also to be put in hand immediham are estimated to cost £10,633, this sum inately.

Cleadon, Durham.—The newly erected Cleadon School, which was formally opened on December 7th by the chairman of the North-Eastern District Education Committee of the Durham County Council, Mr. C. E. Thompson, J.P., provides accommodation for three hundred people. It is a one-storey erection, built of red brick with simple stone dressings. There are six classrooms, one of which is fitted up as a cookery room, and the central hall is 42 ft. by 25 ft. Hot water on the low pressure system is used for the heating. The floors are solid, being constructed of boards laid on concrete, and the dados are lined with glazed bricks in the entrance and cloak rooms, and hard and impervious plaster in the classrooms and hall. The school is a "mixed" one, and there are separate playgrounds for the boys and girls. The cost of the building is under £3,200, which is more than £200 less than the sum usually allowed by the County Education Committee for this class of building. The architect is Mr. J. H. Horton, F.R.I.B.A., of South Shields and Newcastle-on-Tyne, and Mr. H. W. Bulmer, of the Education Offices, Durham, has acted as clerk of works. The general contractor is Mr. W. Hall, Derwent Joinery Works, Gateshead-on-Tyne. Messrs. Adamsez, Ltd., Scotswood-on-Tyne, supplied sanitary fittings.

Culford, Suffolk.—A stained glass window that has been placed in the new aisle of Culford Church represents Charity ministering to the aged, blind, and lame, and is to the memory of Beatrix Countess Cadogan. The window has been executed by Mr. Forsyth, of Hampstead.

Enfield.—A county school for girls, and a technical institute are being erected near the Tudor Grammar School here, at a cost of £12,379. The foundation stone has just been laid. The builders are Messrs. Treasure, of Holloway.

Glasgow.—The new premises for the Institution of Engineers and Shipbuilders in Scotland, which were opened on December 3rd, have been designed in later English Renaissance style.

Grimsby.—H. Mudd and Son, Fish Merchants, Grimsby, have recently had some new premises built in the Fish Docks, Grimsby, the architect being Mr. Herbert C. Scaping, of Grimsby. The building is carried entirely on a reinforced concrete raft, this raft, as well as the constructional steelwork, and fire-resisting floors, being carried out by Messrs. Homan and Rodgers, Manchester.

Horncastle.—The new grammar school here, of which the foundation stone was laid on December 7th, has been designed by Messrs. Scorer and Gamble, of Lincoln, in eighteenth century style. Its estimated cost of £4,500 includes the purchase of the site and of large playing fields, and the accommodation is for eighty-four boys and girls

Lancaster.—Now that the hoarding has been removed from the front of the new town hall, a better idea of the elevation is obtained. The huge portico, with its six columns and pyramidal pediment, as seen from Dalton Square, with the tower immediately central with it behind, has a fine effect. The view from Common Garden and Brock Streets is rather unfortunate, the great projection of the portico into Dalton Square interrupting the fine vista of Victoria Avenue and the spire of St. Peter's Church beyond; the perspective is so sharp through these narrow streets that the main thing which catches the eye is the leaded top of the huge pediment. The sculpture in the tympanium of the portico is a fine example, carved from design and model by F. W. Pomeroy, A.R.A., and represents—in the centre, King Edward VII., seated in the robes of State, with crown, orb, and sceptre, richly gilt, supported by female figures emblematical of Justice, on the right, and Mercy, on the left—both seated, these being flanked by standing cherub figures supporting shields bearing the arms of Lord Ashton (the donor of the building), and the arms of Lancaster. These latter are crowned by a ducal coronet, the King being the Duke of Lancaster. The angles of the space are terminated by lions couchant and sprays of Tudor roses. The large clock dials are now being fixed in the four faces of the tower, circular moulded limettes being preferred for their reception. It is expected that the town hall will be ready in time for next year's mayoral banquet.

Letchworth.—The success of the first Garden City is evident from the steady development of the estate, and the large number of buildings at present in course of erection, of the principal of which the following is a brief summary:—In Broadway, a house designed by Mr. Alwyn O. Cave; builders, Messrs. S. Redhouse and Sons. In Station Place, bank premises for Messrs. Barclay and Co.; Mr. E. Burgess, London, architect; Mr. T. Newton, Hitchin, builder; also a large block of shops, Mr. E. Simms, architect, Mr. G. W. Sonster, builder. In Leys Avenue, two shops; Mr. C. M. Crickmer, architect; Mr. A. Collins, builder. Also four shops: Mr. Allan Foxley, architect; Messrs. Openshaw and Co., builders. In Commerce Avenue, a bakehouse for Mr. F. Nott; Messrs. Wheatley and Duncanson, London, architects; Messrs. Openshaw and Co., builders. In Pixmore Way, two houses; Messrs. Underwood and Kent, architects; Mr. H. Rose, builder. In Meadow Way, two houses; Messrs. Underwood and Kent, architects; Mr. Jeffs, builder. In Rushby Mead, the Conservative Club; Mr. C. M. Crickmer, architect; Mr. H. Hurst, builder. In Cashio Lane, block of houses; Messrs. Bennet and Bidwell, architects; Mr. Jeffs, builder. In Norton Road, block of houses; Messrs. Underwood and Kent, architects; Mr. Hudson, builder; also the elementary schools, to seat 680 children, from the design of Mr. Urban Smith, county surveyor; Messrs. Hacksley, Wellingborough, builders; cost about £9,000. The Letchworth Cottages and Buildings, Ltd., are also having several blocks of cottages built in Common View. The First Garden City, Ltd., are making a large addition to the "Kosmos" Factory, and are also erecting a new factory for Messrs. Kryptok, Ltd. They also have several roads under construction. The factories are from the designs of Mr. H. Burr, surveyor to the company, and Mr. A. W. E. Bullmore is engineer for the roads. The whole of the work is being carried by their own men, under the personal superintendence of Mr. W. G. Satchell, works manager. The Hitchin Rural District Council are reconstructing the roadways in the old Ickneild Way, and in Green Lane, Letchworth, and the work is being carried out by Messrs. Davis, Ball and Co., at a cost of about £2,000.

London, N.W.—A new Unitarian church for Kilburn and West Hampstead, in Quex Road, West Hampstead, has been built at a cost of about £3,500, from the design of Mr. Chatfeild Clarke. It is in memoriam of the late Dr. Brooke Herford.

Mountain Ash.—The Church of St. John the Baptist, Mirkin, Mountain Ash, of which the foundation stone has just been laid, will seat 532. It has been designed in Late Gothic style by Mr. Bruce Vaughan, F.R.I.B.A., and the first portion consisting of nave, aisles, and south porch, is being built by Messrs. E. Turner and Sons, of Cardiff, at a cost of £3,230.

Prestwick.—The new church here, which has just been opened, has been built at an estimated cost of £5,000. The material is Ballochmyle finished stone, and the accommodation is for 500 persons. The style is Norman, and there is a tower more than 100 ft. high The architect is Mr. P. Macgregor Chalmers, of Glasgow.

Shrewsbury.—The proposed new schools at Coleluding Messrs. Treasure and Son's contract price of £6,883; cost of site, £2,142; and cost of furclerk of works' salary, and other incidental exniture, of paving the yard, of architect's fees, penses.

Obituary.

Mr. George Mallinson, who died, aged 77, on December 5th, at his residence in Filey, Yorks., served his articles with the firm of Barry and Browne, of Liverpool, and emigrating to New Zealand, built, at Port Lyttleton, the first stone church there. Returning to England, he practised successively in Leeds, Dewsbury, and Ripon.

FIRE-RESISTING CONSTRUCTION SECTION.

(MONTHLY.)

Fireproofing Materials under the New Patent Act.

The successful application for the rescission of an English patent for certain fire-resisting slabs on the ground that, in contravention of the new patent law, they have been produced in Belgium, whereas they should be manufactured in our own country, whither they have been imported in large quantities, is a matter that not only affects the fire-proofing trade to a very considerable extent, but must have an appreciable bearing on trade in general. This decision of the courts will probably put a stop to the importation of such building materials as could be advantageously produced in the United Kingdom. The argument that, labour being cheaper in Belgium, the cost of production is lower, supplies no valid excuse for non-compliance with the new law—the Patents and Designs (Consolidation) Act, 1907, which expressly provides that British patents may be revoked when they are worked exclusively or mainly abroad, unless satisfactory reasons can be given why they are not worked in the United Kingdom. In no other country but Great Britain would the professional men, the builders, or the administrative authorities tolerate the introduction into buildings of foreign goods that could be equally well made at home; and hence it is certainly a matter for congratulation that the Patent Act, as interpreted in the law courts, will prevent some at least of such patented articles from being imported into this country. It is now proved to demonstration that such articles must be made in Great Britain if the patent rights in them are to be maintained. Fear of the hardships that the new Act may inflict on British firms that, acting as agents for such foreign materials as come under its ban, have exploited the goods at their own expense, may be easily exaggerated. The rescission of the patent does not necessarily extinguish the manufacture of the article. It simply kills the monopoly. Then, surely the original agent—or, rather the agent for the time being—whose name, by extensive advertisement, is closely identified with the goods, and who has, by his satisfactory trading, established a connection and a reputation, enjoys an enormous advantage over any rivals who may think it worth while to enter a field that, while thrown open to all comers by the operation of the Act, is so thoroughl yexploited as to render competition exceedingly hazardous to the newcomer. The agent who already occupies the ground, and who has adopted sound and judicious methods of publicity, has only himself to blame if he fails to maintain the position of advantage to which he has attained. We see no reason why similar results should not follow the event under notice. In this instance, also, the open market may lead to brisker business. At all events, the decision shows that the new law is not to be trifled with, and the demonstration of a case in point will probably lead to an expansion of home industries, to the benefit of both producer and consumer. The latter naturally prefers the goods that are manufactured in his own country; and the former cannot fail to realise that this consideration is a powerful factor in the stimulation of demand.

"The Times" on Fire Prevention.

It is but rarely we see the "Times" devoting space to questions of fire prevention, even in the ably managed columns of its Engineering Supplement, and we thus welcome an article in the issue of December 9th, entitled, "Progress in Fire Prevention," which deals with the subject in a comprehensive way as far as building construction proper is concerned. For fire-resisting purposes, the great advance made in the use of concrete is particularly dwelt upon, and details are given of some of the more important floors which have been officially tested in this country. The advantages of suitable aggregates and finely ground Portland cement are specially referred to. On the door question we observe that roller shutters are finding favour, and are likely to be looked upon as the appliance of the future for closing large openings. Altogether the article gives a very excellent idea of the progress that has been made in fire prevention during the last decade.

LONDON PRIVATE FIRE BRIGADES.

The London Private Fire Brigades Association, which now comprises 850 members, held its fourth annual competition at the Guildhall of the City of London. The challenge shield is presented by the Corporation of London for the encouragement of good work among the private fire brigades of London, and is of solid silver, and worth considerably over £100. Teams representing fifteen brigades competed, and the competition was divided into two parts, the first taking place outside the Guildhall, and consisting of one officer and four men, hydrant (wet) drill, and the second part in the hall itself, this being a surprise drill (dry) for one officer and six men. The nature of the latter drill was such as to bring out the good points in brigades when dealing with sudden outbreaks of fire, and is in no sense a set show drill which a team could win by practising. At the conclusion of the competition, Mr. John H. Lile, chairman of the City Lands Committee, announced that the challenge shield had been won by the Robertson Electric Lamp Co.'s brigade, and the three first times were as follows:—1, Robertson Electric Lamps, Ltd., Brook Green, 360 2-5 secs.; 2, Bradbury, Wilkinson, and Co., Ltd., Farringdon Road, 403 3-5secs.; 3, R. H. and S. Rogers, Cliftonville Works, Rotherhithe, 410 3-5secs.

The competition was watched by the Lord Mayor and sheriffs, accompanied by many members of the City Corporation, Colonel Fox (Chief of the Salvage Corps), Lieutenant Sladen (Third Officer of the Metropolitan Fire Brigade), etc., etc. The Lord Mayor, in presenting the shield and silver medals to the winning team, congratulated them on their activity and energy, and upon the fact that they were the first team to win the shield for the second time.

SIMPLE MEANS OF EXTINGUISHING PETROL FIRES.

If the roller shutter door tests have concentrated the interest in the work of the British Fire Prevention Committee in the building world and among the public officers controlling buildings, the tests of Wednesday afternoon, December 2nd, certainly brought together one of the largest attendance of members and visitors interested in fire extinction that the Committee could accommodate with reasonable care for their safety.

The occasion of the attendance was a series of tests regarding the extinction of petrol fires with such ordinary means as cloths, sand, and steam, the type of cloths used being asbestos cloths as obtainable everywhere in the open market.

The tests comprised a series of 25, and have been arranged at the instance of the Association of Cleaners and Dyers, who conduct a somewhat dangerous trade, where petrol spirit is constantly in use and fires frequently occur, and whose members were anxious to have some evidence as to the utility of such simple means of extinction as described above.

On this occasion Sir James Williamson, C.B. (member of council), together with Mr. Edwin O. Sachs, F.R.S.Ed., received the visitors on behalf of the British Fire Prevention Committee, and the arrangements as to the conduct of the tests were of exceedingly elaborate character.

The duties of conducting the work were in the hands of a strong sub-committee, with Mr. Percy Collins, J.P., as directing member. Among others serving on the sub-committee were Chief Officers Folker, Dyer, and Henderson (vice-presidents of the National Fire Brigades Union), and others well versed in the subject under review, including some members of the Association of Cleaners and Dyers, who had been specially co-opted for this particular duty.

To meet the contingency of accidents, the ambulance arrangements were on an extensive scale, under Surgeon-Major Maitland Coffin, F.R.C.P., and Dr. Schaub, M.B. The police arrangements were also on an extensive scale.

The visitors included the Assistant Under-Secretary of State, Sir Henry Cunynghame, K.C.B., Major Cooper-Key, and others from the Explosives Department and Factory Department, officers from the War Office, Admiralty, H.M. Office of Works, as also public officers from the London County Council and various Corporations.

The tests were undertaken with petrol and all manner of vessels of various shapes and sizes, and also in such special appliances such as are used in the dyeing and cleaning trade. They were conducted in a quite remarkably efficient manner, with great rapidity and precision, and yet with every precaution to meet the hazardous character of the work. The excellence of the organisation of the tests, in fact, called for general remark.

The results, as in the case of all the committee's work, will be embodied in a report, and we believe it can be safely said that the results were very satisfactory and eminently instructive.

THEATRE REGULATIONS IN PARIS.

Although the regulations as to theatres, concert halls, and public buildings, recently issued by M. Lepine, the Paris Prefect of Police, are only applicable within the area of the Paris prefecture, and in the town and communes of the department of the Seine, and in the departments of the Seine-and-Oise, the prefects and mayors of the other towns of France will certainly not fail to be guided by these measures of security. But whatever is done in France in the matter of theatre safety also receives the attention of our public authorities in this country, and we thus think it useful to reproduce such parts of the rules as we consider instructive. They should be useful not only to those who have the regulation of these matters, but also to the architects in practice who have charge of building work of the theatre type, of assembly rooms, town halls, and similar structures.

It will be observed that in the French rules particular discrimination is made between the theatre, the music hall, and the ordinary assembly room.

(*Free Translation.*)

I.—GENERALLY.

(1) Every person desiring to construct a building wherein public performances or exhibitions are to take place, must send for permission to a Prefect of Police. Exception is made of theatres which were permitted to be built under the decree of January 6th, 1864, which had to be subject to a declaration submitted to the Minister of Public Instruction as well as to the Prefect of Police.

(2) Every request for permission must be accompanied by detailed plans, sections, and elevations to the scale of O.M. 02 to the metre. These plans must indicate the number of floors and rooms to be placed at the disposition of the public. These plans must be furnished in triplicate, and must be signed. The interested parties must also furnish the plans and notices, etc., regarding the electric installation of the building, in accordance with No. V. of the present ordinances. The Prefect of Police will notify to the interested parties his acceptance or refusal of the plans, and, if need be, indicate what modifications must be made on them.

(3) The works must not be commenced until after definite consent to the plans has been given, and no modification whatsoever must be made in the course of construction unless it has been submitted to the Prefect of Police, or if it has been refused by him.

(4) A building to be used by the public having received authorisation, it will be subject to a visit from the Prefect of Police, who will assure himself that the building has been executed in accordance with the plans, and will indicate any modifications or alterations that he thinks necessary.

(5) No change or alteration may be made in the construction or management of an existing building unless these changes have been accepted by the Prefect of Police. Any such changes must satisfy the conditions set forth in articles Nos. 2 and 3 above.

DIVISION OF THE BUILDINGS.—2.

(6) The buildings defined under Article 1 are divided into three kinds in accordance with the risks which may occur in installation and management. Those which come under the first category are:—

(a) Buildings which have scenery manipulated from above and below. (b) Those coming under the second category are buildings having scenery not manipulated either from above or below. This category comprises equally circuses, hippodromes, velodromes, and other analogous establishments which have no scenery. (c) Those coming under the third category are buildings having no scenery, but which comprise a simple platform, which can be fixed or movable.

The category under which any building is to come will be determined by the use to which it is to be put. If the use to which it is to be put should be changed, the class or category under which it ranks may be modified.

II.—CONSTRUCTION AND GENERAL MANAGEMENT.—1.

(7) All the buildings coming under the first category, and those of the second and third categories—to accommodate at the least 500 people—must have on each floor, facing one or more streets, a facade to at least 6 metres in width. The width of the facade must be increased by 1 metre for every additional 100 persons after the first 500 accommodated.

(8) As soon as the number of persons accommodated exceeds 1,500 but does not exceed 2,000, the building must have a facade on two streets, or it must be detached on two of its sides.

(9) When the number of spectators exceeds 2,000 but does not exceed 3,500, the building must have a facade on to three streets, or be detached on three sides.

(10) When the number of spectators exceeds 3,500, the building must be an entirely detached building.

(11) The streets and courtyards provided for in the preceding articles must have dimensions in accordance with the rules issued on the 13th August, 1902, but in no case must their width ever be less than 5 metres; this width must at least be equal to that of the exits of the building on to the streets and isolated courts; these latter must be in easy communication with the public thoroughfares.

(12) In the parts of the building where the buildings under Category 1 join on to constructions or other properties, a division wall in brickwork must be erected no less than 0.45 metres in thickness, to protect neighbouring property. This wall must have no opening whatsoever on to the neighbouring property.

(13) In buildings coming under Category No. 1, the only people allowed to reside there are the watchman, a caretaker, and the manager of the building or his representative. It is forbidden to introduce into this building anything which does not appertain to it or anything which is foreign to the use for which it was erected.

II.—STAGE.

1.—Scenery of buildings coming under 1st Category.

(14) The stage must be surrounded by thick brick walls, having a thickness of not less than 0.45 metres; these walls must present a straight flat surface, and no part of them must be recessed or projected beyond the boundary line. The windows in the walls on the stage must always be higher than neighbouring buildings within a radius of 10 metres.

(15) The wall to the front part of the stage must be at least 1 metre higher than the height of the auditorium, and must end in such a manner as to form an emergency exit easily accessible.

(16) No communication must exist between the stage and the uppermost parts of the auditorium.

(17) It is not practicable to allow any openings in the walls surrounding the stage, except such as are strictly necessary to ensure proper service on the stage and proper exits from the stage. At floor level from the stage there must always be two exits, one at each side, of sufficient width to allow of the stage being quickly cleared if necessary. In the upper parts of the stage no communication must exist with the staircases and exits which serve the artists' rooms and the building which contains administrative rooms.

(18) All these openings must be closed by thick doors constructed of fire-resisting material, and in such manner as to oppose the passage of smoke and gas. The doors which are situated at stage level must open outwards from the stage, all the other doors open inwards on to the stage. The doors of communication between the stage and the auditorium and its rooms must be kept locked during the performance, and they must be easily opened from the stage side.

(19) The stage opening must be completely closed by a metal curtain working easily and noiselessly. The lowering of this curtain should be done from two directions: one from the stage side of the curtain, and the other on the outside from a point easily accessible. The lowering should be done with the aid of some simple device. To provide for accidents, where the machinery will not act, provision must also be made for the lowering to be done effectually by hand. Winches or windlasses should not be fastened down with catches, but they should be worked automatically. The metal curtain must usually be kept lowered; it should only be raised during performances.

(20) At the top of the stage must be an opening closed by one or more traps. The sections of this opening must be equal to 1-20th of the surface of the stage. The opening of this bay must be done from two points, which must be in opposite positions; one on the stage in close proximity to one of the points working the metal curtain, the other in proximity to the other working point of the metal curtain.

(21) The carpentry work at the top must be in incombustible material; the covering must be of not easily inflammable material, the flies must be of light material, 1-7th of the surface of the covering must be of fine glass.

(22) The staircases, the ladders, the bridges, the grids, the different floors above and below, the floor supports, the machinery, and generally the whole of the movable installation on the stage proper must be of incombustible material; the parquetry on the stage must be of impregnated wood. Similarly the suspension wires or cords must be equally of incombustible material; the wires or cords for manipulation can be covered with hemp or some other easily handled material.

(23) The scenery, as far as practicable, the stage accessories, the decorative curtain, and generally all movable installation on the stage proper should be non-inflammable. The theatre management must in due course give to the prefecture of the police, notice of the installations, decorations, etc., to be used, so that same may be tested from the point of view of non-inflammability by someone appointed by the prefecture. These tests must be made at least once a year, and a certificate will be given each time bearing date. As non-inflammable are to be considered materials which burn without giving off flame, non-inflammability will not be considered obligatory for furniture.

(24) The stage proper shall not be encumbered with decorations, the amount of scenery and decorations will be fixed according to the building.

(25) The scenery accessories and furniture used for the day's performance must without fail be removed to the scene store after use which is away from the stage and away from the auditorium.

(26) All accessories which are very combustible, such as garlands, cloths, shavings, etc., etc., must be kept in a special place, specially built of non-combustible material, and which must be kept closed by a dividing door which is also constructed of non-combustible material.

(27) All scenery, decorations, accessories, and furniture for the stage, not in actual use, must not be kept within the walls of the building proper, but they must be kept in stores, away from the building, constructed according to ordinance issued on March 27th, 1906.

(28) The counter-weights for stage installation must never be placed in situations accessible to the artistes or to the public, neither should they be over water-pipes or wires for lighting.

(29) It is forbidden to construct boxes within the precincts of the stage proper. Any seating accommodation needful for stage attendance must be reserved just in front of the stage.

(30) No artiste's room, or other local annexe, excepting the store containing accessories should open directly on to the stage.

(31) The firemen must have easy access to the stage, without having to pass through any exits specially reserved for the public.

(32) Smoking is forbidden on the stage and in the rooms belonging to it.

2.—Buildings coming under the 2nd Category.

(33) The stage shall be surrounded by walls of incombustible material.

(34) If the stage goes over other floors, or has other floors over it, floors and ceilings of incombustible material must be put dividing the stage from these different floors. No opening of any kind must be made in these floors. No smoky chimney belonging to neighbouring parts must come in connection with the stage building.

(35) The walls containing the stage must only have openings in them which are necessary. All these openings must be closed off by fire-resisting doors.

(36) All the fixed installations in the stage building must be of incombustible material. The parquet flooring only of the stage may consist of specially impregnated wood.

(37) The scenery must be of fine sheet iron, metallic cloth, asbestos, or other similar substance of an incombustible nature, and they must be mounted on metal. Any needful object on the stage must be of incombustible material. Stage accessories and all movable installations within the stage building must be of non-inflammable material, as also the curtain to the front of the stage. Non-inflammability is not obligatory for furniture.

(38) Articles 24, 25, 27, 29, 30, 31, 32 above-mentioned also apply to buildings coming under Category No. 2.

3.—Buildings coming under Category 3.

(39) Buildings coming under the 3rd Category may not contain a stage; a simple dais fixed or movable, can be put into the hall; its doors and platform must be constructed of incombustible material, or at least all wood must be covered with plaster. The floor of the platform and the joinery alone may be of uncovered wood.

(40) On fixed platforms and within their area, there may be only one fixed uniform kind of decoration, which must be incombustible, or it much be "mounted" on incombustible partitions. Any accessories must be rendered non-inflammable. Movable platforms may not have any scenery whatever.

III.—AUDITORIUM.

1.—Buildings coming under the 1st Category.

(41) The auditorium and all its adjoining dependencies, that is to say, the vestibule, staircases, foyers, buffets, exits, etc., and generally all the parts accessible or not to the public must be constructed in fire-resisting materials.

(42) The ceiling over the auditorium, the ceilings separating the different floors, and the upper parts, must be constructed in fireproof material.

(43) The supports and visible carpentry, the pillars and the joists not covered in masonry must be surrounded by some fire-resisting material.

(44) The joinery, the parquet flooring, and the upper parts of the treads may be in wood; the parquetry and the upper parts of the treads must be perfectly fastened to the framework of the floors and staircases. The upper parts of the treads and the staircases must not be polished, or of material which will polish with use.

(45) Metal grilles, sufficiently closed, will be fixed below the window sashes, lighting the auditorium, and its adjoining dependencies accessible to the public. The sashes to the roof will be protected above by a metal grille.

(46) All cloths and other decorative objects must adhere firmly to the surfaces which they are covering.

(47) The portières and curtains may be fixed to doors and to windows and carpets may be laid on the floors, but such hangings and carpets must be of an uninflammable character, and must not be any hindrance to the public passing to and fro.

(48) It is forbidden to have any work-rooms or any rooms with fires in the apartments over the auditorium and its dependencies or in any parts below the auditorium.

(49) Under the places specified in article 41, there may be rooms for storing costumes, rooms for rehearsals, general storage rooms and libraries. These stores and rooms must have no communication whatsoever with the auditorium and its dependent apartments, neither must they communicate with the stage. The only access to these rooms must be by way of the building containing the offices. The access to these parts must be closed off by armoured doors and in fire-resisting material. These doors must be kept closed and locked whilst the public is in the auditorium.

2.—Buildings coming under Categories 2 and 3.

(50) The auditoriums of buildings coming under the second and third category must be constructed and managed in the same way as those coming under the first category. The floors which divide these establishments from neighbouring apartments will be of fire-resisting material. An exception is made for the general construction of auditoriums destined to contain less than 500 people which, if they are not built in fire-resisting material, must be closed in and covered with plaster.

(51) No communication must exist between the auditorium and the neighbouring apartments.

IV.—ADMINISTRATIVE OFFICES (Rules applicable to all Establishments).

(52.) The administrative offices, which include the artistes' rooms, the workshops, electricians' rooms, tailoring rooms, sewing rooms, hairdressing rooms, etc., etc., and the various stores necessary for the conduct of the establishment must tbe constructed according to the rules applicable to the auditoriums of their category. They will be divided from the auditorium and its dependencies by thick masonry walls.

(53) There will only be in these walls the necessary openings for the carrying out of the business and for first aid purposes. These openings will be closed by armoured doors. The stairs and work shops will be away from the staircase and closed off by similar doors.

(54) There must be an easily accessible staircase for the use of the artistes, it must also be possible to use this by two different exits.

(55) The exits to the administrative offices and to the orchestra must never be encumbered with articles of clothing, etc., etc., they must be quite free to enable easy passing to and fro.

(56) It is forbidden to fix any portiere, curtain or any cloths which are of an inflammable material, of any description in the artistes' rooms, in the foyers, in the store-rooms, or in the workshops. The walls and ceilings must not have any decoration, except paintings or papers and cloths which adhere perfectly to the masonry. It is forbidden to smoke in any of these rooms.

(57) Such costumes, as are not in use must not be kept in the artistes' rooms, they must be put away and kept in special stores. Such costumes, in such special stores, if they are not locked away in wardrobes, must be covered by some non-inflammable cloth.

(58) It is forbidden to hang up or lay down clothes, excepting in such rooms as are set apart for that purpose.

(59) No manufacture may be carried on in the building, neither is it allowed to have any stores of explosives in the building, if anything of the kind is necessary for the due performance of the play, it will be brought in at the last moment, when required and deposited in some special place set apart.

III.—EXITS FROM THE AUDITORIUM.

1.—General Rules.

(60) All seats on ground level must never be at a lesser height than 3.50 metres from the street level.

(61) The height of the ground level of the auditorium of a building coming under the first category and that of the auditoriums of buildings of the second category which are to accommodate more than 500 people, must never be more than 4 metres higher than street level.The height of the ground level of buildings of the second category to accommodate less than 500 persons and those of the auditoriums of buildings coming under the third category to accommodate more than 500 persons, must never be more than 8 metres higher than street level.

(62) In order to define the number of persons to be admitted to each kind of building there should be added to the number of seats, the number of persons who can stand in the promenade, on the basis of three persons per square metre of promenade surfaces. As promenade may be considered all such spaces where the public can stand to view performances. On the upper tiers, where the seats are not separated or numbered, the number of spectators shall be at the rate of one person per 0.45 metres width of the bench.

(63) The number and width of the exits shall be in proportion to the number of spectators admitted into the auditorium as a whole, and in accordance with the seating arrangements. This rule applies, not only to exits into the street but on to the staircases and exits of the building.

(64) The staircases and general exits must be so arranged that the current going towards the vestibules and the exits is not jostled.

(65) Cloak-rooms must be arranged in the part of the building containing the auditorium and off routes and exits and staircases. These cloak-rooms must be so placed that the people using them, do not hinder the general public leaving the and entering the building. In any case, cloaks to be deposited or hung up in the passages and exits.

(66) It is forbidden to deposit or leave on the staircases or in the exits ways, any objects whatsoever, which can hinder the circulation or which will diminish the width of such staircases, exits, etc., even if this width is greater than obligatory, as laid down further on. The offices on the contrary must be mobile and must never obstruct the exits.

(67) The seats may be fixed in the passages used by the public for the staff of the building. These seats should raise automatically and be so installed that they will not reduce the width which is compulsory for these passages neither must they hinder the circulation of the public or form any projection in the passages, when they are raised.

(68) It is forbidden to have any steps in the passages of the auditorium, any differences in level must be adjusted by graduated slopes, the incline of which must not exceed 10 centimetres to every metre.

(69) Doors closing off side scenery, turning doors, turn styles, and rolling ways and movable staircases are forbidden. The lifts must be in accordance with the regulations laid down further on, and must not be the cause of any diminution in the needful dimensions of the staircase and passages. They may only be worked by the staff of the establishment.

(70) Visible signs indicating to the public where the staircases and exits are, must be put up. It is forbidden to put up looking-glasses, which might mislead the public as to the position of the exits and staircases. Any openings with "Exit" for the public must be indicated by proper signboards.

2.—Exits.

(71) All exits must be properly spaced out in the building. If the building goes into the open on to the street, into courts, on to terraces, etc., there must be an exit to each one of such open spaces.

(72) The auditorium, the stage and its dependencies must have independent exits into the open.

(73) If more than 100 persons and less than 500 persons are assembled in a building, there must always be at least two exits for the public, and there must be one additional exit for every 250 or fraction of 250 persons over and above the first 500 mentioned.

(74) The width of the exit doors must never be less than 0.75m.

(75) Any doors leading into the open must be according to the nature of the open spaces they lead to. Tambours may be authorised before these doors after having been examined by the Public Authorities.

(76) The width required for exits on to the open only applies to such openings which are destined exclusively for the use of the public. In this width will not be counted the exits which may exist across cafes, buffets and other inside annexes belonging to the buildings. It will also not cover the exits for first aid which may be established on to the neighbouring buildings.

(77) The doors shutting off interior passages of the auditorium, those opening into the corridors, the covers, the vestibules, etc., etc., must open outwards. These doors must be so arranged as not to form any projection in the passages or on the staircases, etc., etc., and they must not hinder the current of the public towards the exits.

(78) The manner in which the doors of the boxes shall open is to be determined by the Public Authorities after examination of plan.

(79) Doors leading into the open, with the exception of those which are always kept open, those closing interior passages, staircases, vestibules, etc., must be glazed in the upper part so as to enable the public to find its way to places where there is light.

CHAPTER III.

Couloirs and General Passages.

(80) The width of the doors and exits on to the open will be based on a minimum width of 0.80m. per 100 persons.

(81) The width of all general passages, ways, couloirs, staircases, etc., will be in proportion to the number of spectators who are to use these passages. It will be based on a minimum width of 0.60m. per 100 persons, and will never be less than 1.50m.

(82) When places on ground level are lower than street level or higher by 2 metres than the street level, the width of the passages and staircases communicating by ground level of the auditorium with the vestibules and with the open, it will be calculated at the rate of 0.80 per 100 persons using these passages.

When places on ground level are below street level, the passages and staircases serving these places will be independent of those serving the upper floors.

4.—Special Rules for Staircases.

(83) The position of the staircases will be chosen in such a manner that they will serve all parties in the building easily, and will enable the public to get into the open quickly from the vestibules and exits.

(84) When more than 100 persons or less than 500 persons are assembled on one or more floors above ground level, there shall always be at least two staircases. There shall be an additional staircase for every 250 or fraction of 250 persons over and above the first 500. (This number will be calculated in part according to the number of floors there are, so that the number of staircases increases in proportion with the number of spectators called upon to frequent the building.)

(85) The staircases to the passages must run without interruption down to the street level.

(86) Staircases destined for the use of the public must be straight, without angular turnings. Their width must never be less than 1.20m. There must be hand-rails on both sides.

(87) The width of the staircases must at no point be narrow when approaching the exits.

(88) There shall be landings, so as to limit the steps of the staircase to 20 at a time. The landing shall have an equal width to the width of the staircase. Their length shall not be less than 1.20m.

(89) If the auditoriums are confined by "couloirs" or by promenades, the staircases and their landings must be situated outside the "couloirs" or promenade.

(90) Doors closing off staircases leading on to the vestibules, "couloirs" or passages, etc., must not form any protection on the staircases, nor must they decrease their width. A landing of at least a metre must precede them from the staircase side.

(91) For exit purposes all the staircases must communicate with one another in such a way that they can be used by every section of the public, excepting according to Art. 82 setting forth the Rules for Staircases serving places below street level.

AMENDMENT OF THE LONDON BUILDING ACT.

At a meeting of the London Council that obtained some degree of notoriety owing to an extraordinary interruption by one of the members, no business was transacted, the Building Act Committee stated on the agenda that "there is one important matter which should be dealt with in the session of Parliament of 1909, viz., the use of steel construction and reinforced concrete in buildings. This method of construction was not contemplated in the Act of 1894, and there is no doubt that a change of the law in this direction is necessary in order to meet modern building requirements; and we have been strongly urged by the Royal Institute of British Architects, the Institution of Civil Engineers, and the Surveyors' Institution to promote legislation with that object. Under the London Building Act, 1894, the walls of all buildings must be of the thickness prescribed by the first schedule of the Act, with the effect that the walls of buildings mainly constructed of steel or reinforced concrete have to be of a greater thickness than is necessary for stability, thus unnecessarily diminishing the floor space of the buildings." The committee therefore recommended "that application be made to Parliament in the session of 1909 with a view to the amendment of the London Building Act, 1894, so as to facilitate the use of steel or reinforced concrete in the construction of buildings, and to make any necessary provision with regard thereto."

Since that unfortunate and memorable meeting the Council have accepted the Building Acts Committee's proposals, and thus new enactments are in course of preparation.

The question of the amendment of the London Building Act of course raises an important point from the fire aspect, but if we are rightly informed, due provision is being made in the Bill for the proper protection of the steel frame against the action of fire. This is as it should be, and we cannot but impress upon those in authority the absolute necessity of firmness on this particular feature.

Seeing that steel-frame buildings will be practically a class by themselves, we also think that some additional precautions might be safely taken in their case as to the hazard of outside openings, lift shafts, and small areas, and we think that the property owner, having the advantage of building in steel frame, and the economy of space thereby arising, would not object to additional precautions being taken in other directions in such buildings.

We trust, too, that those in authority will be guided by the experience of the British Fire Prevention Committee as to the materials to be used for protecting

steel framing; this experience, which has now spread over some ten years and is so precisely recorded, should be made use of on an occasion like this.

Turning to reinforced concrete, we should prefer to see regulations embodied in the Bill, but we are fully alive to the difficulties of this course, having regard to the present stage of the science of reinforced concrete in this country. But from the fire point of view there should at least be some broad lines laid down most strictly in the Bill, so as to indicate that, no matter what the scientific aspect of the construction may be, a certain minimum of protection must be afforded to the metal work, a certain minimum thickness of walls and floors defined, whilst the scientific details could be left to regulation, though preferably to by-law. The size of any aggregate to be used is also a matter that might be defined in the Bill.

The amendment to the Building Act will open up numerous highly interesting problems, and should afford interesting discussion. But, speaking generally, the new amendments should be of advantage to the community. Thus we desire to take this opportunity of congratulating Mr. Riley—the Superintending Architect to the London County Council—on this further proposed advance in the direction of giving the Metropolis additional building facilities which will be welcome from the fire point of view as long as the necessary precautionary measures against fire are clearly defined in the Act, and cannot be made the subject of the Council's party politics or so often varying ideas of equity.

THE BRITISH FIRE PREVENTION COMMITTEE'S TESTS.

Fire-resisting Roller Shutters.

We dealt at some length, in the last monthly fire-resisting section, with the highly interesting series of roller shutter door tests that have been conducted by the British Fire Prevention Committee, the "Wilson" type of shutter being at present under review. The tests of November 4th were continued, with further tests on November 25th, when there was again such a large attendance of visitors as to more than forcibly express the great interest being taken in the subject at the moment.

On the day in question the tests, as announced, comprised single shutter door tests, one being an official test with a single roller shutter to a 7 ft. opening, and the other an experimental test in the form of a re-test with the single roller shutter which had already been previously tested on the 4th November, and after that re-test had been repaired to the extent of receiving a fresh roller and hood. The object of the test was to obtain the classification of affording "full fire protection" (Class A), which involves the application of fire to a temperature up to 1,800 deg. Fahrenheit for 2½ hours, followed by the application of water from a steam fire-engine for 2 minutes.

On the previous occasion Sir Henry Tanner, I.S.O., F.R.I.B.A., principal architect of H.M. Office of Works, represented the Council of the British Fire Prevention Committee, and received the visitors. On this occasion, Mr. Riley, F.R.I.B.A., superintending architect to the London County Council, was present to receive visitors on behalf of the Council of that body.

Mr. Riley was supported by Mr. Edwin O. Sachs, F.R.S.Ed., and Mr. Percy Collins, J.P., members of the executive, whilst the testing operations were conducted by a strong sub-committee, of which Mr. Max Clarke, F.R.I.B.A., was the directing member, Mr. Ellis Marsland, and Mr. Grellier, F.R.I.B.A. (district surveyors), Chief Officers Dyer and Henderson, and Mr. A. E. J. Fulkes (insurance surveyors) were members.

There was again a large attendance from the Admiralty, War Office, and other Public Departments, as also a number of officers from the London County Council Building Act and Fire Brigades Department.

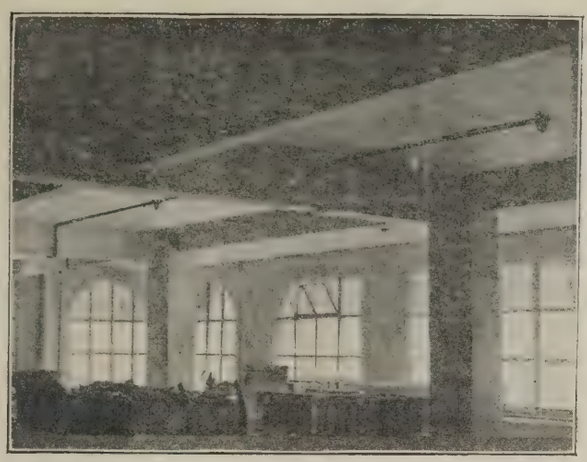
We understand further tests on this shutter question are in preparation for January, so that when the reports appear thoroughly comprehensive data will be available as a guide to our public authorities and to architects in private practice.

The question under investigation, of course, not only affects the problem of protecting large door openings in party walls or divisional walls with double shutters, but also the very important point of protecting window openings with single shutters, a matter requiring the serious attention of property owners in the City whose houses so often face narrow thoroughfares or share mutual areas.

ALL-ROUND CO-OPERATION IN CIVIC FIRE PROTECTION.

The benefits of greater co-operation between fire departments and underwriters are becoming more fully recognised. At the recent convention of the International Association of Fire Chiefs, held in Columbus, Ohio, there was an interesting discussion upon the matter. Strong appreciation was expressed of the benefits that have accrued during the past four or five years to the firemen of the country through the skilful work of organised fire-insurance interests in securing improvements in matters of fire defence in many cities and towns.

Those who deprecate associational activity in the business of fire insurance, as savouring too much of the "combine," would do well to ponder the opinions of civic fire-fighters with regard to the debt which the property-owning public owes to underwriting associations. As Chief Tyson, of Louisville, pointed out at Cleveland the other day, insurance organisations are just as urgent as firemen in demanding the best apparatus and the most plentiful supply and pressure of water for fire-extinguishing purposes; but the prime motive of their efforts is to encourage prevention of fire; and to this end they make critical examinations of all parts of a building, follow the processes carried on or the materials kept in stock, locate them in the least dangerous spot available, and seek to surround them with such safeguards as expert knowledge and experience dictate. All information gathered is kept on record by the underwriters' organisations, and is open to the inspection of and use by any chief who may desire to avail himself of it, the underwriters being always glad to co-operate in securing the removal or modification of any dangerous condition which might appeal to him as being of sufficient importance to demand prompt attention.



In Chief Tyson's opinion, one of the most important results of closer co-operation is that the public has become interested, the business community being more inclined to add its influence towards securing proper civic means of fire prevention and fire fighting.

In closing, an effective appeal to his fellow fire chiefs was made by the speaker. "It appears to me that we are derelict in not at once and continuously availing ourselves of the opportunity to possess such a fund of useful, and frequently essential, information as may be had for the asking, or at least a nominal expense, by the establishment of more intimate and friendly relations with organised insurance bodies and associations. Let us cast aside all prejudice, and, by mutual confidence and co-operation, take advantage of the opportunities afforded us through the systems adopted by organised fire insurance."

WAREHOUSE, IVY LANE, NEWGATE STREET.

This large warehouse was built for Messrs. J. Grossmith and Co., perfumers. The architect was Mr. A. H. Saul, A.R.I.B.A., of London, and the contractors and licensees for the Coignet system, under which the floors throughout, and the roof of this building, were constructed, were Messrs. Peacock Bros., of London. The general contractors for the work were Messrs. E. Lawrence and Sons, of London.

WAREHOUSE, IVY LANE AND DUKE'S HEAD PASSAGE, LONDON, E C
INTERIOR OF ONE OF THE FLOORS.

As to the type of floor construction used, the Coignet system is too well known to need description here, but we would mention that for a warehouse of this type the system of design can be specially recommended, for the two fire tests undertaken with floors of this description at the British Fire Prevention Committee's testing station amply demonstrated its reliability from the fire point of view.

The first portion of this warehouse contained seven floors, and the area of each floor was 1,600ft. and the height of the building approximately 50ft. The superloads to be carried by the floor were calculated from 1½ cwt. to 2 cwt. per sq. ft. The new Coignet trussed beam was used throughout for main beams. Two heavy lintel beams raised upon reinforced concrete columns or pillars support the brick walls on the two principal fronts of the building. The roof, which is altogether in reinforced concrete, is a skew gable roof in construction.

It will be worthy of note that one of the sides being much longer than the other, it was necessary to bind the structure in such a manner as to counteract an uneven thrust upon the walls.

The roof is covered with slates. In the roof there are dormers which are also constructed in reinforced concrete.

Owing to the great value of the materials stored in the warehouse, the architects advised his clients to adopt the system of reinforced concrete applied throughout the structure, except in the outer walls, where not permissible under the Building Act.

"FIRE WASTE," ITS COSTLINESS AND PREVENTION.

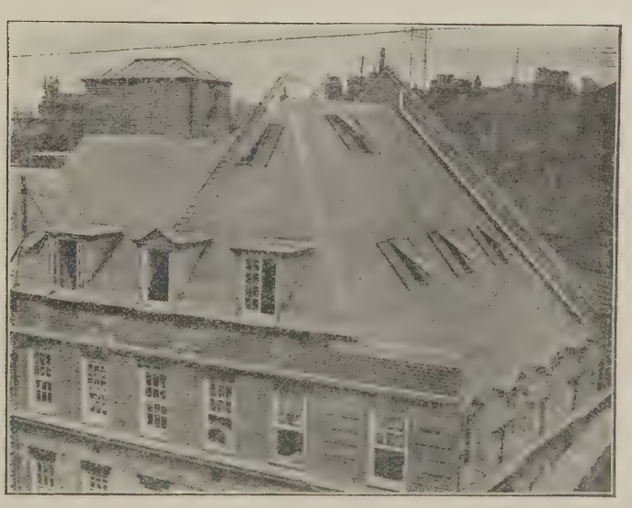
Mr. J. Montgomery Hare, president of the National Board of Fire Underwriters (also manager for the United States of the Norwich Union Fire Office), appeals to the American public in the following manifesto:—

"We desire to invite attention to certain features of the work of the National Board of Fire Underwriters which touch the public interest in common with our own, and suggest the fullest co-operation from all concerned. The total property loss in the United States for 1907 is reported as $199,383,300; while for the past five years the destruction of values by fire in the United States has amounted to $1,257,716,955, or an average of over $251,000,000. No country, however rich, can suffer such enormous losses without seriously impairing its prosperity. . . .

"With the purpose of aiding municipal authorities, the National Board has in its employ competent hydraulic, fire department, and electrical engineers and insurance experts of high standing in their professions, for the purposes of investigating existing conditions and presenting model building laws, thus endeavouring to minimise losses by fire throughout the country.

"The condition of the water supply and fire-fighting facilities and character of construction of buildings of a city is one of great importance to all concerned in the welfare and prosperity of the community, especially to its business interests and its property-owning citizens. The actual conditions are reported as found without prejudice by these experts, whose daily occupation gives them exceptional qualifications as judges of such matters. Many instances might be cited as examples of imperfect and even highly dangerous conditions, and it is, we think, as much the duty of the insuring public as that of the fire underwriters to prevent, if possible, a recurrence of disasters similar to those of Chicago, Boston, Jacksonville, Peterson, Baltimore, San Francisco, and Chelsea.

"According to the figures tabulated by the Committees on Statistics of the National Board of Fire Underwriters, as per reports from the United States Consulates, the fire loss per capita in six European countries was as follows:—



Country.	Years.	Fire Loss. Annual Average. Dols.	1901. Populations.	Loss per Capita. Dols.
Austria	1898-1902	7,601.389	26,150,597	0·29
Denmark ..	1901	660,924	2,588,919	0.26
France	1900-1904	11,699,275	38,595,500	0·30
Germany ..	1902	27,655,600	56,367,178	0·49
Italy	1901-1904	4,112,725	32,449,754	0·12
Switzerland	1901-1903	999,364	3,325,023	0·30

or an average loss per capita of $0.33 for the European countries named. In the United States, as a whole, the average per capita loss for five years ending December 31, 1907, was $3.02.

"The result in thirty foreign cities gave a per capital loss of $0.61, as against $3.10 in the five years' average of 252 cities in the United States.

"Taking the number of fires to each 1,000 population in the same cities, our Committee on Statistics found it to be 4.05 in the American cities, as against 0.86 for those of Europe, showing also that, in point of frequency, fires here are far in excess of those abroad. In the European cities, practically all fires are confined to the buildings or place of origin, while such is far from being the case in the United States, owing largely to a low standard of construction. Thus it would appear from all the statistics available that the per capita loss in the United States is appallingly greater than in any other country, whether the comparison be by cities or by countries. During the past four years over 125 of the more important cities have been investigated, and the reports have been supplied to municipal authorities, property-owners, and civic organisations, and as a result many improvements have been obtained.

"If, in the future, the insuring public will use their influence to secure proper building laws, such as are outlined by the National Board Building Code, more efficient water supply and better fire-department equipment, the destruction of pro-

SKEW GABLE IN ARMOURED CENCRETE, COVERED WITH SLATES.

perty by fire will be materially decreased and the cost of insurance to property-owners thereby lessened. Money thus expended in such improvements would advantageously affect the welfare and prosperity of the entire community. Co-operation in this work is earnestly invited."

TECHNICAL EDUCATION AND FIRE PREVENTION.

We have long advocated that our architectural and civil engineering schools should have courses of fire protection, and fire prevention in particular, but we have never gone so far as to advocate any special school devoted specially to this subject.

In the United States, where fire prevention is becoming a separate science and profession, steps have, however, already been taken in this direction; and the Armour Institute of Technology now has a special course on the subject, and students can become graduates. The idea of this course should be of such general interest that we are printing below the prospectus issued by the Institute of Technology in question. If some of the ideas from this prospectus were taken by architectural and engineering schools, and also certain of our polytechnics, much would be done in the direction of encouraging fire prevention.

Announcements Regarding Courses on Fire Protection.

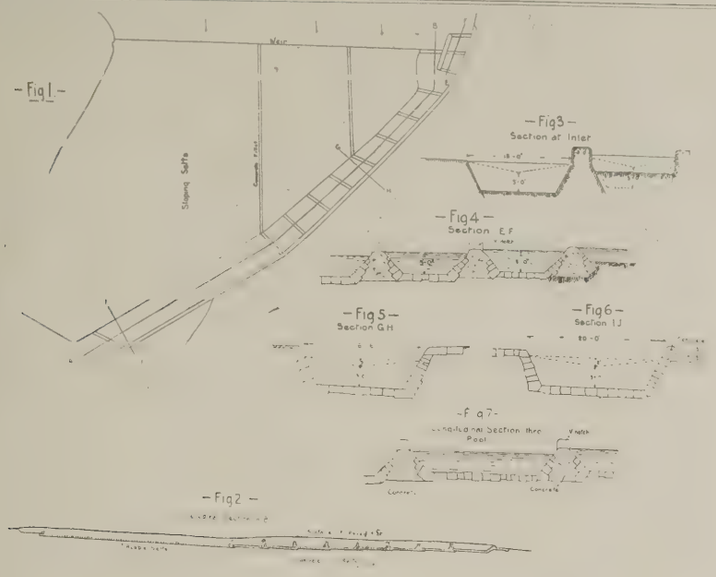
The City of Chicago offers exceptional advantages for the study of problems involved in protection against fire loss. The Underwriters' Laboratories, conducted and maintained by the stock fire insurance companies of the country, are situated here, and this national testing station gives opportunity for thorough investigation and study. Armour Institute of Technology, in 1903, established a four years' course of training in fire protection engineering. The Underwriters' Laboratories, offering their facilities for experimental and research work, are co-operating with the Institute in making this course efficient, both theoretically and practically. The general engineering equipment of the Institute, and the advantages offered by the use of the Underwriters' Laboratories, insure a broad and comprehensive course of study, fitting young men for expert work in the fire insurance field with municipalities, corporations, and manufacturing companies.

The problem of reduction of the large losses by fire that occur annually is one that has not been regarded as capable of solution until comparatively recent years. Fire insurance, while it may indemnify the property owner to the extent of the actual market value of the property destroyed by fire, cannot repay him for the many indirect losses which are attendant upon the fire. The interruption of his business, the securing and moving into new quarters, the replenishing of his stock, all involve loss which is not covered by any ordinary insurance policy. Moreover, the delay incident to adjusting and collecting his claims for loss may seriously interfere with the re-establishment of his credit. Gradually, however, it is becoming known that money spent in making property safe from fire is money well spent. Expenditure incurred in securing excellence in design and construction and adequate protective equipment throughout the premises are a good investment, because the increased cost may be saved in a few years by a reduction in the rates of insurance. The property owner also has the benefit of a larger measure of security against the interruption of his business. All these matters are becoming evident, not only to the property owners, but to fire insurance companies, and consequently there is now a determined effort on all sides to train men who are competent to deal with the problems involved. The reduction of the firehazard in the various forms in which it appears in practice necessitates careful study and intelligent application of protective measures. Inefficient or unsuitable "protection," so-called, may represent a considerable initial cost nearly or quite equal to that of thoroughly adequate treatment of the property, although incapable of coping with the hazards present. Failure of such inadequate protective measures has in more than one instance resulted in loss of the investment for protection, and in the destruction of the property for the safeguarding of which it was originally expended. Public protection as applied to towns and municipalities is also a field in which intelligent thought may be productive of increased efficiency, and where legitimate saving may result.

The occupations which students in the Department of Fire Protection Engineering of Armour Institute of Technology may have in view are varied. In the fire insurance field the need is becoming apparent for capable men having experience, executive ability, and technical knowledge to fill the higher executive positions in the larger insurance companies. Such positions may be reached by capable and industrious men who have completed the course of training which is offered. Present activity in fire protection engineering is creating a demand for protective equipment and devices of all kinds. Apparatus becomes efficient only after a careful study has been made of the conditions which have to be met in service. The making and marketing of such apparatus offers a growing opportunity for men who have a comprehensive knowledge of the principles of fire protection engineering. The students who have been graduated from the Department of Fire Protective Engineering have acquired such knowledge, and are thereby qualified to reach eventually the responsible positions mentioned above, while they are able in the meantime to do satisfactory work as building, electrical, and automatic sprinkler inspectors with insurance inspection bureaus, insurance companies or municipalities; as experts on fire prevention and protection in the employ of fire insurance companies; in technical or executive positions with manufacturers of fire protective apparatus; as superintendents of fire protection for manufacturing and other corporations; or as engineers in private consulting practice.

The curriculum of the course includes the fundamental subjects, such as mathematics, physics, electricity, and applied mechanics, which are necessary as a foundation for any engineering training. Particular attention is given to the study of industrial and engineering chemistry, and a series of thorough courses in these subjects extends throughout the first three years. The purely professional work of the department is given in the third and fourth years, and begins with a careful study of types of building construction and general practice in the application of protective measures. A critical examination is made of underwriters' requirements, and those pertaining to field work are illustrated by many field inspections conducted by a competent instructor experienced in inspection work. A study is made of the various rating schedules in use in different parts of the country, and practical application of these schedules is made to the mercantile, manufacturing, and special hazard risks for which they are designed. All of the work is extended to cover buildings in course of construction, as well as finished and occupied premises, and includes attention to faults of design, structural defects, installation and maintenance of fire stops and protective equipment.

The laboratory work of the department is carried through the junior and senior years of the course, and is supplemented by outside tests of steam and electric pumping machinery and other protective apparatus embodied in private equipments which have been placed at the disposal of the department. Thus the student is familiarised with correct and faulty construction, and the installation of hazardous and protective equipment and apparatus. The work is planned to include demonstration of practical test methods for use in the field, laboratory, and shop.



TWO NOTABLE SPECIAL ISSUES.

"Recent English Domestic Architecture."

The special issue of "The Architectural Review," bearing this title, is now ready (price 5s.), and is issued from the offices of "The Architectural Review," Caxton House, Westminster. The work represents an earnest attempt to produce a representative selection of specimens of modern English domestic architecture, and it is believed that this aim has been satisfactorily achieved. The collection is quite catholic, no conscious bias towards any particular school of design having ben allowed to influence the choice. More than two hundred illustrations, reproduced in the best possible style, and printed on art paper, show elevations, interiors and plans by architects who have achieved distinction in domestic work; and the letter-press, rendered in English, French, and German, in parallel columns, gives useful particulars as to construction, materials, etc. The book should be at once a record and an inspiration.

The "Builders' Journal" Special Issue.

In the Special Issue of THE BUILDERS' JOURNAL, which is being prepared for publication on December 30th, there will be a wealth of photo-process engravings of the highest class illustrating the history and development of English architecture, with notes on the various periods by Mr. Prior, Mr. Gotch, and Mr. Mervyn Macartney. In addition, the issue will contain many special features, in both the text and in the illustrations, that will possess extraordinary interest for the architectural and building world. As this sumptuous and covetable volume costs but a shilling, the issue is sure to be speedily exhausted, and we reiterate our advice to our regular readers to make early application for it.

ILLUSTRATING NOTE ON "FISH PASSES."

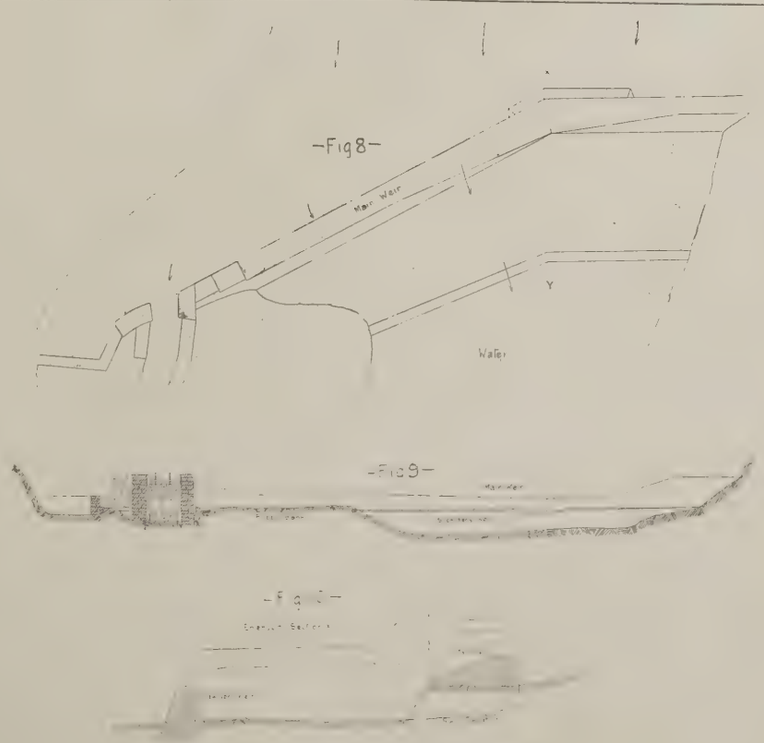
CONSTRUCTING FISH PASSES.

[In view of the recent correspondence in THE BUILDERS' JOURNAL on salmon ladders, the following particulars may be of interest.]

In cases where streams are used by mill owners for driving water wheels the water is often kept back by a weir, to keep a good head of water for power purposes. The weir may consist of a balk of timber filled up underneath with clay, or a masonry wall running across the river, backed by an inclined surface paved with setts, and sloping downwards from the weir towards the mouth of the stream. It is difficult, and in dry weather impossible, for fish to pass up the river over the weir, and it is therefore necessary to provide a series of pools in such a convenient position as to enable the fish to pass the weir and reach the water. This is done as shown in Figs. 1 and 2, and in detail 3 to 6 (p. 485 by providing pools holding a depth of water of 3ft. along one side of the stream and weir. Th number of pools required is determined by the difference in level of water above and below the weir, the height of one pool above the one next lower being in this case 9in., the idea to be kept in mind being the height of a fish's jump, and this must be kept at a minimum to give the fish every chance of clearing the divisions between the pools. The divisions between the pools are made of cement concrete faced with setts, as shown in sections, and formed as a V notch longitudinally, the bottom of the pools being lined with setts and clay puddle.

The weir in another case is, as shown in section Fig. 10, and the difference in level not being great, a subsidary weir is constructed, and acts in place of a pool, inasmuch as it holds water when there is none flowing over the weir.

The idea is to have such a construction that water is always retained in such a way that the fish are able to make use of it for jumping in the dry season.



The late Mr. Henry Barnato, whose estate is estimated at five millions sterling, has left to his trustees the sum of £250,000 for the purpose of founding a hospital or other charitable institution in memory of his late brother "Barney" Barnato.

SOCIETIES' REPORTS.

R.I.B.A.

Mr. Edwin T. Hall, vice-president, at the invitation of the Local Government Board, recently gave evidence before a committee appointed by the Board of Trade to inquire into the relationship between architects of public buildings erected from loans sanctioned by the Board and engineers who advise in respect of enginering work required for such buildings, the point being considered whether the latter work should be withdrawn from the control of the architect. A printed copy of Mr. Hall's evidence was subsequently sent by the committee to the Institute council, with the intimation that the commitee would be glad to receive any representations the Institute desired to make on matters coming within the scope of their inquiry. Among these was the question how it should be determined what plant to instal at poor-law institutions—to what extent, for instance, it was desirable that the installation of plant at such institutions should be under the direction of the architect. The matter was considered by the Council at a meeting in October last, when the following resolution was passed: "That the Council of the Royal Institute consider it imperative in the interests of the employers that the architect of such public buildings should have the control, direction and supervision of everything necessary to bring to completion the building which he has designed, and that they endorse the evidence given on this point by Mr. Hall; and further that in each separate case the plant to be installed should be determined by the employers in consultation with the architect." A copy of this resolution was forwarded to the Local Government Board with an expression of the Council's appreciation of the courtesy shown by the Board in affording them an opportunity of expressing their views upon the point.

In a letter addressed last spring from the Institute to the chairman of the London County Council, in which, while acknowledgment was made of the courteous consideration given by the London County Council and its officials to suggestions made by the Institute from time to time upon architectural matters of public importance, it was pointed out how much more usefully suggestions of this kind could be made in the initial stages of a scheme than after it had been developed. The letter went on to suggest that when such matters as street planning, the design of buildings on land leased by the Council, bridges, or monumental works under the control of the Council are under consideration, the Institute might be invited to depute one or two of its members specially competent to deal with the parti-

ILLUSTRATING NOTE ON "FISH PASSES."

cular subject involved, to confer with the Council or its officers charged with the matter, and give their views on its architectural aspect. Should this procedure be found satisfactory, it might be thought desirable at a later period to constitute an Advisory Committee of a few architects, with perhaps a painter and sculptor, whose experience and advice could be placed gratuitously at the disposal of the Council. This in its turn, the signatories hoped, would develop into a body corresponding with the "Conseil des Batiments Civils" of Paris, to which the architectural development of France owes so much. The letter was signed by Mr. Thos. E. Collcutt (President), Sir Aston Webb, R.A. (Chairman Town Planning Committee), John W. Simpson (Chairman Art Committee), Alexander Graham (Hon. Secretary).

The London County Council referred this letter to their Improvements Committee, and the following reply has been addressed to the President:—

"Spring Gardens, S.W.
"November 16th, 1908.

"The President R.I.B.A.,

"Sir,—The Chairman of the Council has laid before the Improvements Committee your letter of February 21st with regard to the architectural features of improvements. The committe are of opinion that the suggestions which the Royal Institute of British Architects have been good enough to make are of great interest and importance, and they desire me to express their thanks for the action taken by the Royal Institute. The matters mentioned in your letter have engaged the careful attention of the committee, but, as Pariament is now discussing proposals for new legislation which, if agreed to, may have great effect on the whole question of improvements, they have come to the conclusion that it would be undesirable to advise the Council at present to come to any definite decision thereon. The committee thought that the Royal Institute would wish to have this intimation of their views, with an assurance that, as soon as a decision shall have been come to by Parliament on the proposals in question, the committee will again consider your letter.—I am, sir, your obedient servant

"G. L. GOMME.
"Clerk of the Council."

Gloucestershire Architectural Association.

At an ordinary meeting of this association, held in the Town Hall, Cheltenham, the president, Mr. F. W. Waller in the chair, Mr. L. W. Barnard was elected a Fellow. Mr. A. E. Hudson, M.R.San.Inst., Chief Sanitary Inspector of Cheltenham, read a paper entitled, "Some Notes on Drainage and Sanitary Plumbing," in which he dealt with many of the common defects found even in much of the modern so-called good-class work, and pointed out how they might readily be remedied. The paper was illustrated with many lantern slides, diagrams, models, and actual fittings.

Leeds and Yorkshire Architectural Society.

Mr. Percy Robinson, F.R.I.B.A., in his presidential address, reviewed the work of last session, and insisted on the importance of art education both to the public and the architect, particularly in view of the building developments that are likely to arise in consequence of the extension of systems of cheap and rapid transit, which are likely to do away with the present anomaly of dear land overcrowded and cheap land lying waste. He took an optimistic view of the future, noting with satisfaction that the "encouraging signs of a more general awakening of public interest in matters relating to our art," and the prospect that "there are likely to be great opportunities arise to evolve out of the conditions of our time an architecture which shall be true to that time."

On November 26th, Mr. Arthur Keen gave a lecture on "The Churches of Sir Christopher Wren in the City of London," before the Leeds and Yorkshire Architectural Society. After referring to the enormous number of old buildings still in existence in London, Mr. Keen pointed out that the most remarkable series of all was the group of buildings of all kinds with which Wren had enriched the City and its surroundings—palaces, private houses, hospitals, and city halls, churches, and a great cathedral, monuments, schools, and many others. The most striking feature of ancient London had been that in the square mile of the City there were 113 parish churches and chapels. Ninety-three of these were destroyed by the fire, and Wren rebuilt fifty of them. The author pointed out that, as the result of the Puritan revolution in England, public worship had become congregational in character, the sermon being the principal thing connected with it, so that no chancels were required, but wide open naves, good lighting, spacious galleries and western organs were essential, all of which were exactly in keeping with Wren's conception of the right treatment of churches in the "good Roman manner" in which he worked. St. Mary-le-Bow, the first to be rebuilt after the fire, showed how utterly Wren departed from every tradition that had governed church-building up to his time. Wren never hesitated to put large galleries in his churches, if they were needed, but he treated them so admirably that they never interfered with the more definitely architectural features and the general scheme of design; in fact, they contributed very materially to the composition of the interiors, by giving deep, broad masses of shade to contrast with the columns and vaulted ceilings. The value of a well-designed organ standing boldly out in a church, as Sir Christopher always placed his organs, instead of in the modern fashion in an organ chamber, was illustrated by some beautiful examples. The lecture was mainly confined to the interior of the churches, but a good many views of towers and lanterns were given, and it was pointed out how much more effective and stately the towers must have looked in the seventeenth century, when the surrounding buildings were about half the height of the present ones, than they do at the present time. All the typical churches were then dealt with in detail, and the extraordinary versatility of the designer was shown, first in the variety of the plans adopted, and then in the endless change and interchange in the use of the recognised materials of architectural design, all used with infinite resource and contrivance. The plans were shown to be progressive from the simplest possible oblong, without either aisles or recesses, up to such a complex scheme as the many-columned, domed, and vaulted church of St. Stephen, Walbrook. The two destroyed churches of St. Antholin and St. Benet Fink were described as fine examples of domed design, and the domed churches still remaining—St. Mary-at-Hill, St. Swithins, St. Mildred's, St. Mary Abchurch, and St. Stephen's were all described and illustrated in turn. A vote of thanks to the lecturer was proposed by Mr. E. O. Dodgson, and seconded by Mr. Butler Wilson, and supported by Mr. C. B. Howdill.

Devon and Exeter Architectural Society.

Mr. T. A. Andrews, Exeter, in a paper on "Some Peculiarities in the Construction of Hollow Walls," recounted some unusual experiences with which he had met in connection with this system of building. The paper gave rise to an interesting discussion.

Junior Institute of Engineers.

Visit to Selfridge's.—With the permission of Mr. Selfridge, the members of the Junior Institution of Engineers were recently enabled to visit the Selfridge Store Building in course of erection at 410, Oxford Street, London. They were shown over by the architect, Mr. R. Frank Atkinson, F.R.I.B.A., and Mr. S. Bylander (member of the Council), chief engineer to the contractors, Messrs. Waring and White (1906), Ltd. The building is of the warehouse class, the frontage to Oxford Street being about 250 ft., and to Duke Street 175 ft. The columns are spaced 24 ft. centres in one direction, and 22 ft. centres in the other, forming floor panels 24 ft. by 22 ft. One girder is placed half-way, making the span of the reinforced concrete floor 12 ft. The building has three basements, and in addition to the ground storey there are four upper storeys, making eight storeys in all. The third basement, however, extends only over a small part of the site, and is used for machinery. The whole of the site is surrounded by ordinary concrete retaining walls, except opposite the third basement, where the foundations extend 60 ft. below the pavement level, at which point a reinforced wall is built. The height of storeys, except ground and first floors, is about 15 ft. from floor to floor. There are nine passenger elevators, about 6 ft. square, two freight elevators, and five staircases. The steelwork is protected from fire by at least 2 in. of clinker concrete in all cases. The facade to Oxford Street and Duke Street is Portland stone; that to Somerset Street is brick. The exterior walls are self-supporting, and the interior walls are carried on steel. The thicknesses of walls throughout are in accordance with the London Building Act, and no reduction in thickness for interior walls has been permitted. The cubical content of each part of the building is limited in accordance with the Building Act, and hence the necessity of small rooms and many interior walls. The girders in the floors have been figured to a total load of 220 lb. per sq. ft. The main girders and columns are figured for the same load, except for the main girders, for which ten per cent. reduction has been allowed and twenty per cent. for the columns for the lower tiers. The steelwork has been designed in accordance with the before-mentioned load, with a factor of safety of 4. The load on the subsoil is 5,000 lb. per sq. ft. The concrete floors are 6½ in. thick for a span of 12 ft. The fireproof partitions are made of 2 to 3-in. concrete blocks.

Federation News.

MONTHLY REPORTS.

BURY AND DISTRICT ASSOCIATION.

Secretary: R. Hall.

The members of the Bury and District Master Builders' Association held their annual dinner at the Boar's Head Hotel, Fleet Street, on Friday evening, December 4th, when about 70 members and friends were present, including Mr. W. Bullen, of Liverpool (president of the Lancashire, Cheshire, and North Wales Federation), Mr. G. Macfarlane, past president of the National Federation, and Mr. Robert Hall, secretary. Mr. John H. Hall proposed "The Lancashire, Cheshire and North Wales Federation," coupled with the name of the president (Mr. W. Bullen). Mr. Bullen, in response, said that he had occasionally when on a visit to some of the branches of the Federation, to give words of criticism and stimulation; but in Bury he had nothing of that kind to do. The branch was actuated by the best spirit and was worked on the right lines. They had in Mr. Hall one of the best secretaries in the Federation. Times were bad, he said—in fact, they could not well be worse, but they all hoped to see a change, being confident that no change could be for the worse. Mr. J. E. Tinline proposed the "National Federation of Building Trades," coupling with it the name of Mr. Macfarlane, one of the past presidents. Mr. Macfarlane, in the course of his reply, spoke of the new arrangement made by the Federation with the BUILDERS' JOURNAL, pointing out how excellent a trade and professional paper that was, and urging the need for active support from all the members of the branch. He knew that many of them were subscribers, and he felt that all would reap advantage by becoming such. Referring to trade matters generally, Mr. Macfarlane said within the memory of man there had never been such depression in the trade as there was at the present time. It was now 53 years since he first began to push the jack-plane, and he had been for 42 years in business for himself as a builder, and during that time he had never known such a period as the trades were now passing through. There must be many causes for this lengthened depression in the building trades. He believed that there were twelve per cent. of unemployed among the carpenters and joiners, and he was afraid that in the other trades the conditions were nearly as bad. What was to become of the country? Money was being poured out on education like water, but what was the product? The stature, weight and chest-girth of the men of this country were diminishing, more especially within the last fifteen years. The building trades suffered very much from the high rates that were being levied upon them in towns. He was convinced that these rates had a good deal to do with the state of trade. At the present time people were too frightened to build. They would rather stay on in the old places than build, for each one would say, "If I increase my rent I increase my rates also"; and the rates were more than one-quarter—they were getting near one-half—of the rent. Considerations like these must tell with people who were proposing to build. Their town councils appeared to be running riot, and what with the rates and the stringency of the building by-laws, it was becoming impossible to build a cottage that would pay. They knew that five shillings a week was enough for any workman to pay for rent, but between the land and the building by-laws no private individual could build a cottage to let at that amount that would pay. It was worth nobody's while to build cottages. They had all heard the old proverb, "As safe as houses." But very few used that proverb now. There was a slump in houses, and in the face of that he thought it ought to be borne in upon their corporations and public bodies that they had come to a crisis in finance that they must face, or they would bring red ruin upon the country.

Mr. Macfarlane gave "The Bury Association." In doing so he said their Association was looked up to with respect by every other association in the Federation. He hoped the day of prosperity would soon dawn for Bury and for Lancashire.

Mr. Howard, the senior vice-president, responded.

Other toasts proposed were "Our Guests," which was given by Mr. A. L. Shaw, and responded to by the representatives of the Operatives' Association, who were present; and "The Past Officers and Secretary," proposed by Mr. T. Kenny and responded to by Mr. P. Barton and Mr. Robert Hall. Mr. J. Hutchinson also proposed "The President," who briefly responded.

SHEFFIELD ASSOCIATION.

Secretary: T. Smith.

The following paragraphs were, for want of space, held over from the report appearing in last week's issue.

Letters were read from the office of the BUILDERS' JOURNAL calling attention to the reduction in the price of the journal to 8s. 6d. per annum for members of associations, and members were urgently requested to become subscribers, as much in their own interest as in the interest of the National Federation, who derived a benefit from the success of the journal, which, as the organ of the National Federation, was the only medium through which members could keep thoroughly conversant with what was occurring in the trade throughout the country. Several non-subscribers were present, and ten additional subscriptions were taken.

A letter was read from the secretary of the Yorkshire Federation covering copies of the paper he had written on "Municipal Trading," a copy of which had been sent to every member of the association. Mr. Hodkin said it was the best exposition of the case he had ever seen, and, on his motion, seconded by Mr. Mastin, the secretary was instructed to send a copy to every member of the Sheffield City Council.

The treasurer (Mr. A. Mastin), whose reappearance at the meeting of the association after his recent severe illness was warmly appreciated, presented his monthly report, which showed continued progress in the funds of the association. The amount collected for subscriptions and levies this year, despite the state of trade, was the highest in its history, being £66 8s. 10d. more than for the whole of 1906, and £29 16s. 10d. in advance of last year. This was without reckoning further profit from publication of the Telephone Calendar. Mr. Mastin said that this excellent financial showing was doubtless due in some measure to the new basis of assessment, which was now made on the actual wages paid by ordinary members, who made such returns privately to the secretary, the particulars being entered in a locked book which was not disclosed to any other person except the professional accountant of the association. Beyond this, their membership had increased, and this naturally brought a further accession of income. For these altered conditions they were to some extent indebted to the secretary, and Mr. Mastin moved that a committee be appointed to consider the question of giving suitable additional remuneration to the secretary for the extra work which had been and would be necessitated. Mr. Cook seconded, and the motion was unanimously carried, as was also a further resolution appointing the committee to consist of the president and vice-presidents and the past-presidents of the association.

Two new members having been elected, the meeting proceeded to discuss the newly appointed vigilance committee. Some doubt appeared to exist as to its scope and duties, but it was explained that the operations of the committee were in the main comprised in watching on behalf of the association the actions of the City Council in any matters which directly or indirectly affected the building trade. Urgent matters of a general nature would still be dealt with by the emergency committee.

Delegates to the Yorkshire Federation were elected for the ensuing year.

The secretary gave a report in regard to the new Telephone Calendar, and the way in which he proposed to use it in increasing the membership of the association.

The matter of the publication of a book containing day-work prices, etc., together with the working rules of all the operatives' societies and other useful matter, was considered, and the name of Mr. A. T. Biggin was added to the committee previously appointed. Mr. J. Biggin observed that such a book would be a boon to the association. Those associations who had day-work prices in successful operation told them they were behind the times at Sheffield.

Mr. Mears, the vice-president of the association, apologised for raising another matter at the fag-end of a meeting which had lasted nearly three hours, but he wished to give notice that at the next meeting he would introduce a discussion as to who should be considered to be eligible as members of the association, and the way in which the national crest should be used. He claimed that the National crest should be the mark of a craftsman, and not be allowed to a man who might casually drift into the building trade.

Mr. J. A. Watson took up the discussion, and instanced the case of plumbers who had to conform to a certain standard of efficiency in order to obtain their diploma. He also held that the National crest did not rightly appear on the stationery of a merchant, and advocated that some alteration on the crest for merchants should be suggested to the National Federation. It was pointed out that the words "associate member" might be placed on the band at the bottom of the crest, and, underneath, the name of the association of which he was a member might be added; but some members thought this did not constitute a sufficient differentiation.

Mr. Biggin said the National had decided that members of an association affiliated to the National had a right to use the crest, and they could not get beyond that. The matter was then left for further discussion at next meeting.

WAKEFIELD AND DISTRICT.

Secretary: J. Beaumont.

The annual meeting of the members of the Wakefield and District Association was held at the Strafford Arms Hotel, Wakefield, on Thursday evening, December 3rd; Mr. Tom Lee (president) was in the chair, and he was supported by an average number of members.

Mr. J. Pashley, who had been nominated along with the president for the position of president for the ensuing year, expressed a desire to withdraw his nomination in favour of Mr. Lee, and this course was agreed to by the meeting.

Alderman Judge thereupon formally moved the re-election of Mr. Lee as president for the ensuing year, and this was seconded by Mr. Elvey and carried unanimously. In returning thanks for his re-election, Mr. Lee spoke at some length on the work of the association and the Yorkshire Federation during the past year, and referred to the excellent work done by Mr. H. Fallas as the association's representative on the Yorkshire Executive Council, also of the proposed visit of the Federation to Wakefield, on the 17th instant, and urged upon the members of the association the importance of attending this meeting.

On the conclusion of the president's address, the election of the vice-presidents and general committee was taken by ballot and resulted as follows:—For vice-presidents, Mr. G. Crook, Mr. H. Fallas, Alderman Judge, and Councillor Spink. General Committee: Bricklayers' and Masons' Section, Mr. C. S. Denison, Mr. E. A. Elvey, Mr. R. L. Leake, Mr. D. F. Parker, Mr. J. Pashley. Joiners' Section, Mr. W. J. Atkinson, Mr. H. Blackburn, Mr. J. E. Bramall and Mr. J. Lazenby. Plasterers' Section, Mr. J. W. Sanderson, and Mr. T. E. Senior. Plumbers' Section, Alderman Atkinson, Mr. W. H. Moss. Yorkshire Federation Counson, Mr. W. H. Moss, Mr. Crook, Mr. Fallas, and Alderman Judge had been nominated in conjunction with the president, as representatives of the association on the Yorkshire Federation Executive Council, but on the president informing the meeting that Mr. Fallas had been nominated on the Finance and Emergency Committee of the Council, Alderman Judge withdrew his own nomination, and on his proposition Mr. Crook was elected as the emergency representative of the association on the Council.

Mr. J. Beaumont was re-elected secretary on the proposition of Mr. Fallas, seconded by Mr. Elvey.

The secretary submitted the accounts for the past year duly audited by Alderman Judge and Mr. D. F. Parker, which showed a balance in hand of £29 0s. 8d., as compared with £24 13s. 7d. in hand last year. Alderman Judge moved the adoption of the accounts, and this was seconded by Mr. Elvey and carried.

The auditors were warmly thanked for their services on the motion of Mr. Pashley, seconded by Mr. Elvey, and supported by the president, Alderman Judge, responded on behalf of himself and Mr. Parker.

On the proposition of Mr. Elvey, seconded by Mr. Fallas, the president, Alderman Judge, and the secretary, were appointed a special committee to make all the necessary arrangements for the visit of the Yorkshire Federation to the city on the 17th instant. Alderman Judge incidentally mentioned that the Mayor of the City had promised to receive and welcome the members of the Federation.

During the meeting six additional members of the association decided to subscribe to the BUILDERS' JOURNAL.

OTHER REPORTS.

Newport Association.

Newport (Mon.).—The forty-first annual dinner of the Newport Master Builders' Association was held at the King's Head Hotel on December 8th, the president (Mr. A. W. Brownscombe) in the chair. He was supported (during a part of the evening) by the Mayor (Councillor Graham W. White), the ex-Mayor (Councillor T. Parry), Alderman M. Mordey, Alderman W. Clifford Phillips, Alderman S. Cotterell (of Bath), Councillor W. A. Linton, Mr. R. Richards (secretary), and others, the company numbering nearly ninety. After the usual loyal toasts, Mr. L. H. Hornby proposed "The Town and Trade of Newport," and Councillor T. Parry, in responding, expressed his belief that there was a very bright future in store for the builders of Newport. During the next year the County Council were going to build a training college at Caerleon at a cost of £20,000 or £30,000, and he would like to see a Newport builder get the contract. Alderman M. Mordey also replied. Mr. R. W. Moon, proposing "The Architects and Civil Engineers," observed that while it was necessary to have a borough architect and engineer, yet he felt that some opportunity should be given the younger men of the profession to display their abilities. The lines upon which existing school buildings had been laid down were narrow and capable of great improvement. The toast was responded to by Mr. E. H. Fawckner, F.R.I.B.A., and Mr. W. Conyers Kirby, both of whom expressed hearty good wishes for the success of the builders, and the hope that in the development of the town they would have a full share. The toast of "The Building Trade," was proposed by Mr. F. J. Heybyrne, and Councillor W. A. Linton replied, remarking that the future locally was promising. Besides the works that had been already mentioned, a contract had just been signed for the new technical school, which should leave at least £15,000 in the hands of the working men.

Councillor W. M. Blackburn proposed "The Timber, Stone, Brick, and Kindred Trades," and Mr. E. De Vere Brewer, Alderman Cotterell (of Bath), and Mr. C. F. Williams responded. Mr. George Martin proposed "The Visitors," the Rev. Leonard Ashworth, Messrs. M. Shepherd, L. J. Brown, and Claude Lay responded. "The President" was proposed by Mr. W. Jewell, and Mr. W. Brownscombe, in reply, thanked the Master Builders' Association for their loyal support during his year of office, and expressed satisfaction that it had not been called upon to suffer the troubles of disputes with workmen. The toast of "The Press" was proposed by Mr. J. J. Partridge.

Hull Association.

Hull.—The annual meeting of the Hull branch of the Yorkshire Federation of Building Trade Employers was held at the Builders' Exchange, Posterngate, on December 8th, the retiring president, Mr. J. T. Levitt, in the chair. The treasurer, Mr.

G. H. Scorrer, in presenting the financial statement, was pleased to be able to report a most successful year's working, and that the funds of the association were never in a more flourishing condition. After a vote of thanks had been accorded to all retiring officers, the following were elected to serve for the ensuing year:—President, Mr. E. Quibell; vice-president, Mr. R. Finch; treasurer, Mr. J. H. Fenwick; hon. secretary, Mr. A. Peers; auditors, Messrs. Buckley and Hall; solicitors, Messrs. Watson, Sons, and Carrick; Management Committee, Messrs. F. Abba, R. E. Ashbridge, F. Bilton, A. Christopher, J. D. De Lacy, E. M. Darneley, H. Drewery, C. Greenwood, M. Harper, G. Houlton, W. Hodgson, J. Jackson, H. J. Kirkwood, R. Metcalfe, J. Peers, J. E. Railton, F. Singleton, H. Stephenson, G. H. Scorrer, Councillor G. L. Scott, J. H. Simpson, J. Townsley, J. Wilson, J. T. Levitt, and W. Wright; delegates to the Yorkshire Federation, Messrs. E. M. Darneley, R. Finch, J. H. Fenwick, M. Harper, D. Knowles, J. T. Levitt, G. H. Scorrer and J. Townsley; delegates to the National Federation, Messrs. E. Quibell, R. Finch, and J. T. Levitt; delegate to Institute of Builders, Mr. E. M. Darneley. It was decided that August Bank Holiday week be made a general holiday throughout the building trades of Hull. The opinion was that this arrangement would be a boon to all concerned, as it would make it possible for many to get away for a holiday who otherwise would be unable to do so, and it would also make a good opportunity for the overhauling of machinery, etc. It would not cause a very great additional stoppage of the building trade, seeing that the Bank Holiday made a break into the week, and also, the Hedon races were held on two other days in the same week, and these this year caused considerable inconvenience to the building trade generally.

Southern Counties Federation.

Portsmouth.—The half-yearly general meeting of the Southern Counties Master Builders' Federation was held at the "Sussex" Hotel, Portsmouth, when a large and representative gathering was presided over by Mr. W. F. Wallis, of Maidstone, the retiring president of the Federation, supported by Mr. Thomas Costigan, secretary, etc. The half-yearly report was read, in which it was stated that throughout the Southern Counties and the whole country, the bad condition of the building trade had been deplorable, and in consequence of recent legislation it was thought that the increased cost of carrying on business would be great. The district and builders generally owed deep thanks to the president of the Federation for his constant and able efforts in doing his best before Parliamentary Committees in protecting building trade interests. The report also spoke of the great efforts which had been made by the workmen and their societies to combine for their own benefit, and masters were urged to combine, and not throw the onus of protecting the trade upon the few. The following officers were elected: President, Mr. Harold Marshall (formerly senior vice-president and ex-president of the Southampton Master Builders' Association); vice-presidents, Mr. G. R. Chamberlain and Mr. S. Salter; and auditor, Mr. John Croad, of Gosport. Two representatives were elected on the National Federation Council, one on the administrative committee and another on the conciliation board.

Scarborough Association.

Scarborough.—Mr. A. W. Sinclair presided at the annual meeting of the Master Builders' Association, held at the Albemarle Hotel, and was supported by Mr. O. Smith, Mr. W. Malton, Mr. R. H. Carr, Mr. R. Hunter, Mr. R. W. Watkinson, Mr. Chris. Pecket, Mr. J. Hardgrave, and Mr. G. B. Parker (secretary). The annual report, which recorded a very satisfactory year, having been read and adopted, the following officers were elected for the year:—President, Mr. O. Smith; vice-president, Mr. R. Watkinson; auditor, Mr. W. Malton; representatives to Yorkshire Federation and National Federation, Mr. A. W. Sinclair; and secretary and treasurer, Mr. G. B. Parker. The following were elected on the Conciliation Board: The president and vice-president, Councillor Moore, Mr. A. W. Sinclair, Mr. R. H. Carr, and Mr. W. T. Petch.

Wigan Association.

Wigan.—The annual dinner of the Wigan and District Building Trades Employers' Association was held on December 8th, at the Clarence Hotel, Wallgate, when fifty-six persons were present. The president, Mr. W. Webster, occupied the chair, and Mr. John Smith, vice-president, the vice-chair, and among those present were Councillors A. E. Mather, A. Higham, and J. Walkden, Mr. O. Pilling, hon. treasurer, and Mr. R. Hollords, secretary. Councillor Higham, in proposing the toast of "The President," mentioned that Mr. Webster had been connected with the association officially for more than fifteen years, and for twelve years had been its secretary. Mr. Dawson proposed "The Vice-chairman," and Mr. J. Howard that of "The Town and Trade of Wigan." The latter gentleman took the opportunity of remarking that the painting done for the corporation by direct labour had cost three times as much as it would have done if a contractor had been employed. He gave other instances in which the corporation had been unfortunate in dispensing with the contractors. The mayor, in responding, said that Mr. Howard's remarks had strongly impressed him. Councillor Mather, Mr. F. Eyre, and Mr. O. Pilling, also spoke.

Proposed New Works.

Aberystwyth.—The Local Government Board have formally sanctioned the borrowing of £2,880 for the erection of eighteen houses in Poplar Row and Skinner Street.

Barnstaple.—Secondary schools, which it is proposed to erect here are estimated to cost £10,000.

Belper.— M. G. H. Strutt, chairman of the Derbyshire County Council, has given £20,000 for the erection of a higher grade school, pupil-teachers' centre, and baths at Belper.

Cardiff.—Rumney Bridge is to be reconstructed at a cost of about £6,000, to be jointly borne by Monmouthshire County Council and Cardiff City Council.

Conway.—Mr. F. O. Stanford, of the Local Government Board, has held an enquiry with respect to an application by the council for leave to borrow £1,200 for converting the old post-office into municipal offices. The amount includes furnishing.

Dewsbury.—The Board of Management of the Dewsbury and District Infirmary has accepted tenders for the erection of a nurses' home, to cost about £1,400, exclusive of furniture.

Derby.—Mr. Edgar Dudley, Local Government inspector, has held an enquiry here with respect to an application by the Corporation for leave to borrow £12,525 for street improvements.

Dundee.—The city architect has been asked to report on the question of building a city hall.

Fraserburgh.—At the latest monthly meeting of the Fraserburgh Town Council, applications for authority to build were submitted and approved for dwelling-houses to be erected by Mr. Arthur Findlay, and Mrs. Annabella Wallace, in the new street running between Dennyduff Road, and College Rounds; semi-detached dwelling-houses to be erected in Dennyduff Road, by Messrs. William Rennie and John Williamson; dwelling-house adjoining the Free West Manse, to be erected by Mr. Abercromby M'Beath, in a proposed new street running westwards from King Edward Street.

Glasgow.—The reconstruction of the Royal Infirmary, with accommodation for 660 patients, is estimated to involve a total cost of £500,000. The internal plans have been revised by Sir Henry C. Burdett and Dr. Donald James Mackintosh.

Hove.—The proposed extension of the Hove Sanatorium has been under the consideration of the General Purposes Committee of the Hove Town Council. The matter was brought before them in the form of a special report of the Sanitary Committee, in which the Council is reminded that the Local Government Board have sanctioned the borrowing of the following amounts in connection with the scheme: Administration block, £2,400; lodge and discharging block, £1,130; water tower £1,460; destructor, £100; drainage, £1,150; roads, £190. The Sanitary Committee express the opinion that the time has now arrived when these works should be carried out, and they therefore recommend that instructions be given for tenders to be obtained for that purpose. They also recommend that agreements with reference to the improved water supply and the proposed sewer to connect with the existing Portslade-by-Sea sewer be completed and brought up for sealing. The General Purposes Committee, in forwarding the report to the Council, state that they affirm these recommendations.

Leith.—The town council are considering a report regarding a proposal to erect a refuse destructor at a total cost of about £16,000.

Newport, Mon.—A garden suburb, with 300 houses, for "the better class of worker," is to be formed on an estate, comprising about 45 acres, on the eastern side of the town. The planning of the houses limits the number to about ten per acre, as compared with the usual average of thirty. The cost of building the houses will be about £300 to £325 each. The general scheme has been designed by Mr. J. W. Hunte (of Messrs. Newland, Davis, and Hunt), in conjunction with Mr. T. H. Mawson, of Windermere.

Manchester.—The corporation baths committee have approved of a scheme for the erection of new wash-houses in St. John's Ward, at a cost of £7,000; in Armitage Street, Ardwick, at a cost of £10,000; and in Miles Platting, also at a cost of £10,000.

Northam, Devon.—The Northam U.D.C. propose to reconstruct various footpaths at an estimated cost of £1,167.

Nottingham.—An extension of the lunatic asylum, at a cost of £10,800, has been decided upon. The Corporation have also agreed to ask Local Government Board sanction to a loan of £22,000 for the formation of a new cemetery. The cemetery chapels are to be built of stone from Bulwell quarries.

Otley.—Committees have been formed for the selection of a suitable site for a grammar school for Otley. Mr. Ernest S. Mead, of East View, Otley, has been appointed clerk to the committees.

Pakefield.—The parish council have sent a deputation to Mr. John Burns, President of the Local Government Board, to ask for a grant of £10,000 towards coast defence work. It was represented that during the past six years, 12 acres, comprising much valuable building land, fourteen houses, three shops, and twenty-five cottages, have been swept away by the encroaching sea. Building sites to the south of the village, valued in 1899 at £25,941, are now in the market at £7,500, and the owner has spent £3,000 on groynes and a sea wall. Mr. Burns expressed his sympathy, and promised to see what could be done.

Preston-on-Tees.—An effort is being made to raise £5,000 for the erection of a new church here.

Reigate.—The Surrey County Education Committee have decided to erect, at Whyteleafe, a secondary school for girls.

Stockport.—A Local Government Board enquiry has been held with respect to an application by the Stockport Corporation for sanction to borrow £25,650 for the reconstruction and widening of Broadstone Road, Reddish.

Sunderland.—At a recent meeting of the corporation building committee, only twelve plans were submitted. Amongst those approved were the following:—W. and T. R. Milburn, for Glaholm and Robson, machine shop; R. Batty, six houses; G. T. Brown, for H. E. Pitt, house.

Yardley.—Mr. A. G. Drury, Local Government Board inspector, has held an enquiry with respect to an application by the Yardley R.D.C., for sanction to borrow £2,240 for sewerage works, £325 for purchase of land for depot purposes, and £6,718 for recreation ground purposes.

Proposed London Buildings.

The following new works have received the consent of the Building Act Committee of the London County Council:—

Erection of porches and barge-boards to twelve houses on the western side of Cranston Road, Forest Hill, as shown on the plans, submitted with the application of Mr. A. R. Westworth, on behalf of Mr. S. C. Kirby.

Extension of the periods within which the erection of buildings on the northern side of Canterbury Grove, Norwood, was required to be completed be granted, on condition that the buildings referred to be completed within two and-a-half years from June 11, 1907.

Erection of buildings upon a site abutting upon Cambridge Circus, Minerva Street, Centre Street and Felix Street, Bethnal Green, as shown on the plans, submitted with the application of Mr. W. E. Wallis, on behalf of the governors of the Peabody Donation Fund.

Erection of buildings on the southern side of Atwell Street, Peckham, as shown on the plan submitted with the application of Mr. A. E. Mullins, on behalf of Mr. W. Monks.

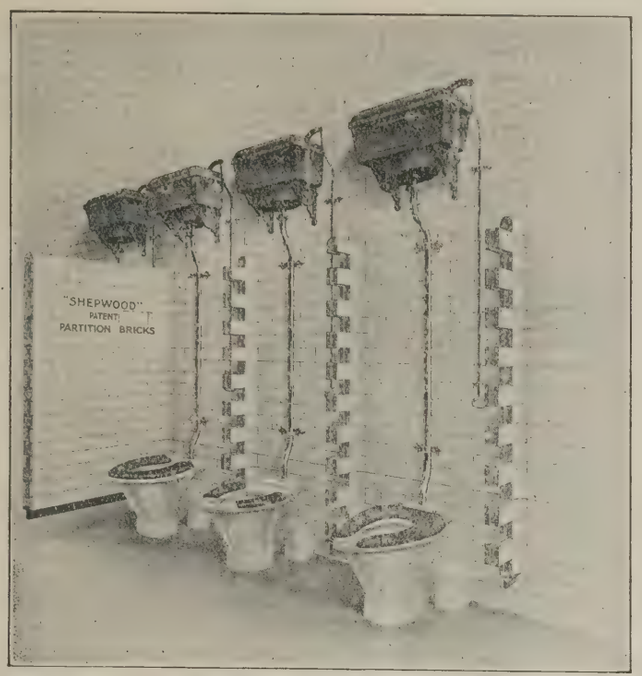
Erection of a building upon the site of Nos. 22 and 23, New End, Hampstead, and the erection of a building at the rear, as shown on the plan, dated 31st October, 1908, submitted with the application of Mr. J. D. Hunter, on behalf of Miss H. S. Creed.

Formation or laying-out of two new streets for carriage traffic to lead from Spring Hill to Craven Walk, Clapton Common, as shown by the plan, sections, and particulars, dated 16th October, 1908, as modified by the amended section, dated 21st November, 1908, submitted by Mr. H. B. Michell, on behalf of the British Land Company, Ltd.

Formation or laying out of three new streets for carriage traffic on the Craven Park Estate, Clapton, as shown by the plan, sections and particulars, dated 10th November, 1908, by Mr. J. Elwood, on behalf of Mr. D. S. Barclay.

Formation of an opening between the Regent entrance of the Piccadilly Hotel, and the adjoining shop to the westward as shown on the plan, submitted with the application of Messrs. W. Woodward and Sons, on behalf of the Piccadilly Hotel Company.

Erection of a house on the southern side of Logan Place, Kensington, with a chimney stack, eaves, rain-water and soil pipes, and gutter projecting into the open space provided at the rear, on the application of Mr. E. W. Marshall, on behalf of Mr. C. Rea.



Erection of additions to the Battersea Polytechnic, Battersea Park Road, Battersea, to abut upon Forfar Road and Lurline Gardens, on the application of Messrs. Mountford and Clapham, on behalf of the Board of Governors of the Polytechnic.

Insurance.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Dec. 17. CASTLE CARY.—Construction of the Castle Cary Water Company's works. Plans, etc., prepared by W. Phelps, C.E., the company's engineer, may be inspected at the office of the company, Bailey Hill, Castle Cary, Somerset. Copies of the specification, etc., can be obtained on deposit of £2 2s. Tenders must be delivered by Dec. 18.

Dec. 17. LEEDS.—Erection of a handicraft centre, cookery room and boundary walls at the Rodley Council school, for the Leeds Education Committee. Quantities may be obtained on application to the architect's section. Tenders may be sent in by 10 a.m. on December 17, to J. Graham, secretary for education, Education Department, Calverley Street, Leeds, endorsed "Tender for Rodley Council School.

Dec. 17. ST. CLEARS, CARMARTHENSHIRE.—Complete renovation of Bethlehem Congregational Chapel, St. Clears. Drawing and specification may be seen on application to Rev. D. G. Williams, Brynawel, St. Clears, or at the office of D. E. Thomas and Son, architects, 17, Victoria Place, Haverfordwest. Sealed tenders, endorsed "Bethlehem Chapel Renovation," to be delivered to B. Salmon, Blaenpant St. Clears, by Dec. 17th.

Dec. 17. GILLINGHAM, Kent.—Removal of the landing stage and brow at the Borough Wharves to its original position alongside the Western Arm of Gillingham Dock. Specification, form of tender and other particulars can be obtained on application to J. L. Redfern, borough surveyor, Corporation Offices. Sealed tenders, addressed to the chairman of the General Purposes Committee, endorsed "Tenders for Removal of Landing Stage," are to be sent to F. C. Boucher, town clerk, Corporation Offices, Gillingham, Kent, before noon on Dec. 17.

Dec. 17. CORK.—Erection of 232 labourers' cottages, and fencing same number of cottage plots, at a cost not exceeding £140 per cottage, for the R.D.C. A contractor may tender to erect all the cottages and fence all the plots, or for such number thereof as he may deem proper. The works are to be completed within six months from date of acceptance of respective tenders under a penalty for delay at the rate of £5 per week per cottage. Plans and specifications and tender forms can be obtained from the clerk to the R.D.C. on payment of 5s., and tenders are to be lodged in his office, Boardroom, Workhouse, Cork, not later than 12 o'clock noon on Dec. 17. Securities required. A deposit of £5 per cottage is required with each tender. Bonds must be completed within seven days from the date of acceptance of tender, otherwise said deposit will be forfeited. Deposits are required to be lodged at clerk's office, and an official acknowledgment obtained. Council will not be responsible for deposits enclosed with tenders. The cottages are to be erected in the following Electoral Divisions of the R.D.: Ballincollig 6, Ballygarvan 8, Bishopstown 8, Blackrock 1, Blarney 18, Caherlag 34, Carrigaline 16, Carrignavar 1, Carrigrohanebeg 2, Douglas 17, Dripsey 1, Dunderrow 3, Greenfort 3, Inniskenny 13, Killeagh 4, Knockantota 1, Knockraha 6, Lehenagh 14, Matchy 3, Monkstown 6, Ovens 7, Queenstown (Rural) 6, Rathcooney 11, Riverstown 6, St. Mary's 24, Whitechurch 12. These numbers include 50 cottages authorised on appeal by the Recorder of Cork. A schedule giving the reference number, townland and name of occupier on whose land each cottage is to be built, may be obtained at the clerk's office. The council will, on the day abovenamed, also receive tenders for fencing one additional allotment in Carrignavar electoral division, one in Inniskenny electoral division and four in Queenstown rural electoral division, at a price per perch not to exceed 12s. 6d.

Dec. 19. WIGAN.—Alterations at the Corporation Baths Millgate, Wigan, for the Wigan Corporation. Plans and specifications can be seen and forms of tender obtained at the office of the borough engineer, King Street West, Wigan. Tenders, endorsed "Baths," must be delivered to H. Jevons, town clerk, Municipal Offices, Wigan, not later than Dec. 19, and those from firms within the borough only will be considered.

Dec. 19. BRAINTREE.—Extension of engine-house No. 1, erection of producer house, coal store, and construction of foundations for new pumping machinery for the U.D.C. at their waterworks pumping station. The drawing and specification can be inspected, and the form of tender obtained, either at the office of P. Griffith, M.I.C.E., engineer, 54, Parliament Street, Westminster, S.W., or at the office of the surveyor to the Council, Vestry Hall, Braintree, on deposit of £2 2s. Sealed tenders, endorsed "Tender, Contract No. 3," to be delivered to H. J. Cunnington, clerk, Braintree, by Dec. 19.

Dec. 21. PADIHAM. — Erection of a new elementary school, at Padiham, near Burnley, for the Lancs. Education Committee, to accommodate 620 scholars. The plans may be seen and bills of quantities obtained at the office of H. Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before twelve o'clock noon on Dec. 21, sealed and endorsed, to F. Shutt, Education Office, Padiham.

Dec. 21. BIRKENHEAD.—Construction of a stone boundary wall at the Flaybrick Hill Hospital, for the Birkenhead Corporation. Plans, specifications, and particulars can be seen, and bills of quantities and form of tender obtained, on application at the office of C. Brownridge, borough engineer and surveyor, upon a deposit of the sum of 10s. Fair wages clause. Tenders, upon the form supplied, sealed and endorsed "Tender for Boundary Wall, Flaybrick Hill," to be sent in to J. Fearnley, town clerk, Town Hall, Birkenhead, not later than 12 o'clock noon on Dec. 21.

Dec. 21. ABERDEEN.—Additions and alterations to be made to the City Hospital, Aberdeen, for the Town Council. Estimates are wanted for the mason, carpenter, plumber, plasterer, slater, painter and glazier, bellhanger, iron, and heating engineer works. Plans and specifications may be seen and schedules of quantities obtained at the office of J. Rust, City Architect, 224, Union Street, Aberdeen, and sealed offers marked "Tender for —— Work," to be lodged with him, not later than Dec. 21, at 12 noon.

Dec. 21. GLASGOW.—Construction of shops at the corner of Leith Walk and Manderston Street, for the Directors of the Caledonian Railway Co. Drawings may be seen at the office of the Company's Engineer, Buchanan Street Station, Glasgow, where copies of the specification and schedule may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Construction of Shops at Corner of Leith Walk and Manderston Street," to be lodged with J. Blackburn, secretary, Caledonian Railway Company's Offices, 302, Buchanan Street, Glasgow, on or before Dec. 21.

Dec. 21. WEST RIDING.—Alterations and improvements to Cononley New School, near Keighley; Salterforth New School, near Keighley; Worsborough Dale New School, near Barnsley; Thorne Provided School. Alterations and additions to Langsett Provided School; repairs and improvements to High Green Provided School; drainage and asphalting, Menston Provided School, for the West Riding Education Committee. Plans may be seen and bills of quantities obtained on application to the office of J. Vickers-Edwards, county architect, County Hall, Wakefield. A deposit of £1 is required in each case. Deposits must be posted, addressed to the West Riding Treasurer, County Hall, Wakefield. A separate letter must be sent to the West Riding Architect, asking for the quantities. Sealed tenders, properly endorsed, to be forwarded to the County Architect, not later than 10.30 on the morning of Dec. 21st.

Dec. 22. BLACKLEY.—Taking-down and setting-back of a dwarf wall and fence at the David Lewis Recreation Ground, Blackley, for the Manchester Improvement and Buildings Committee. Specification and form of tender may be obtained on application at the city surveyor's office, Town Hall, Manchester, on payment of £2 2s. Sealed tenders, enclosed in the official envelope and addressed to the chairman of the Improvement and Buildings Committee, to be delivered at the above office not later than noon on Dec. 22nd.

Dec. 22. NELSON, LANCS.—Extension to the post-office premises in Tickle Street, for the General Purposes Committee:—(1) Excavator, drainer, mason, bricklayer, and concretor's work; (2) carpenter and joiner's work; (3) plumber and glazier's work; (4) painter's work; (5) plasterer's work; (6) slater's work. Plans and specification may be seen and forms of tender obtained on application at the office of B. Ball, borough engineer and surveyor. Tenders, endorsed "Post Office Extension, —— Work," to be sent to J. H. Baldwick, town clerk, Town Hall, Nelson, by Dec. 22nd.

Dec. 22. BRIDGWATER.—Erection of a new Council school, for about 200 children at Somerset Bridge, Bridgewater, for the County Education Committee. Drawings, specification, and conditions of contract can be seen, and further information obtained, at the offices of Cottam and Samson, architects, Bridgwater, who will supply bills of quantities on and after Dec. 14. Sealed tenders endorsed "Tender, Somerset Bridge School," must be delivered at the County Education Office not later than 12 noon on Dec. 22.

Dec. 22. LONDON, N.E.—Conversion of the swimming bath at the Schools at Brentwood into a separate Infants' School, for the Guardians of the Hackney Union. Specifications, conditions of contract, and form of tender can be obtained of F. R. Coles, clerk to the Guardians, Clerk's Offices, Sidney Road, Homerton, N.E., between 10 a.m. and 4 p.m., and the plans may be seen at his office by persons desirous of tendering. Securities required. Sealed tenders, endorsed "Conversion of Swimming Bath to Infants' School," must be delivered at the clerk's office not later than 2 p.m. on Dec. 22.

Dec. 23. WOLVERHAMPTON. — Erection of additional classrooms, etc., at Bingley Street Council School. Particulars and conditions may be obtained on application to T. H. Fleeming, architect to the committee, 10, Queen Square, Wolverhampton. Tenders, addressed to "The Chairman, Sites and Buildings Sub-Committee, Education Offices, Town Hall, Wolverhampton," must be received not later than noon on Dec. 23. Fair wages clause.

Dec. 23. NAVAN CO. MEATH.—Fittings and furniture for the New Crown Post Office at Navan, Co. Meath. Tenders will be received up to but not later than 10 a.m. on Dec. 25. The plans and specification can be seen at the office of H. Williams, secretary, Office of Public Works, Dublin, where forms of tender may be obtained. The envelope containing the tender and the detailed estimate must be endorsed.

Dec. 23. DUNDEE.—Construction in Hennebique's ferro-concrete of No. 3 section of the Eastern Wharf reconstruction (about 260 lin. ft). The general plans, specifications, and bills of quantities may be seen or obtained at the office of J. H. Thompson, Harbour Engineer, Harbour Engineer's Office, Dundee. The contractor will be required to deposit a fee of £5 5s. before being allowed to inspect or receive these documents. Sealed tenders, marked "Tender for No. 3 Section of the Eastern Wharf Reconstruction," must be lodged with the Harbour engineer, not later than Dec. 23, at 10 o'clock, morning.

Dec. 26. WICK.—Execution of the mason, carpenter, slater, plasterer, plumber, glazier, and painter work, also the iron and heating engineer work, of the new higher grade school proposed to be erected by the Wick (Burgh) School Board. The plans and the specifications may be examined at the office of D. W. Georgeson, clerk, or at the office of D. and J. R. M'Millan, board's architects, 105, Crown Street, Aberdeen, from whom schedules of quantities may be obtained on application. Offers, marked "Tender for New School," must be lodged with the clerk on or before Dec. 26.

Dec. 28. RHONDDA.—Erection of an infirmary at their workhouse, Llwynypia, Rhondda, for the guardians of the Pontypridd Union. Plans and specification can be seen, and bills of quantities obtained at the offices of A. O. Evans, architects, Pontypridd, on payment to W. Spickett, clerk to the guardians, Union Offices, Pontypridd, of a deposit of £3 3s. Sealed tenders, endorsed "Tender for Infirmary," to be sent to the clerk to the guardians, on or before Dec. 28.

Dec. 28. BROUGHTON.—Erection of a new council school for 180 children at Broughton. Persons desirous of tendering may see plans, specification, and conditions of contract, and obtain bills of quantities and other information, at the office of W. J. Taylor, county surveyor, The Castle, Winchester, between the hours of nine a.m. and five p.m. (Saturdays nine a.m. and one p.m.). A deposit of £2 2s. will be required for a copy of the bills of quantities and form of Tender. Deposits must be made by cheque, payable to the Hants County Council and crossed "Bank of England," or particulars will not be sent. Tenders endorsed "Proposed Council School, Broughton," are to be delivered to H. Barber, clerk to the C.C., The Castle, Winchester, not later than 10 a.m. on Dec. 28.

Dec. 28. LYMINGTON.—Erection of a new council school for 158 children at Lymington. Persons desirous of tendering may see plans, specification, and conditions of contract, and obtain bills of quantities and other information, at the office of W. J. Taylor, county surveyor, The Castle, Winchester, between the hours of nine a.m. and five p.m. (Saturdays nine a.m. and one p.m.). A deposit of £2 2s. will be required for a copy of the bills of quantities and form of tender. Deposits must be made by cheque, payable to the

Hants County Council and crossed "Bank of England," or particulars will not be sent. Tenders, endorsed "Proposed Council School, Lymington," are to be delivered to H. Barber, clerk of the C.C., The Castle, Winchester, not later than ten a.m. on Dec. 28.

Dec. 30. LONDON, S.E.—Execution of certain work in connection with the provision of additional lavatory accommodation for the Guardians of the Poor of the Parish of Lambeth, at their workhouse in Prince's Road, Kennington Road, S.E. Tender forms and specifications of works, with conditions annexed, will be supplied on application to the office of J. L. Goldspink, Clerk to the Guardians, Guardians' Board Room and Offices, Brook Street, Kennington Road, S.E. The tenders, which must be sealed and superscribed "Tender for Lavatory Accommodation," must be sent to the clerk, or placed in the box provided for their reception in the office of the Clerk to the Guardians by the contractors or their representatives, if they so desire, on or before ten o'clock on Dec. 30, and will be opened in the Board Room at noon on that day.

Jan. 2. CLEATOR.—Erection and completion of a mixed elementary school at Cleator for 350 children, for the Cumberland Education Committee. Contractors desirous of tendering are requested to submit their names forthwith to G. D. Oliver, F.R.I.B.A., county architect, Carlisle, stating the trades for which they desire to tender. Plans and specification may be seen and quantities and all information obtained at his offices upon the receipt of a deposit of £1 1s. for a full set of quantities or 10s. 6d. for each separate trade. Endorsed tenders to be delivered to C. C. Hodgson, secretary to the Education Committee, The Courts, Carlisle, not later than 10 a.m. on Jan. 2.

Jan. 6. USWORTH.—Erection of 50 workmen's dwellings at Usworth, in the rural district of Chester-le-Street. Plans, specifications and general conditions of contract can now be seen and bills of quantities obtained at the office of Brown and Spain, architects, 51, Fawcett Street, Sunderland. Sealed tenders, endorsed "Usworth Housing," to be delivered to R. Simey, clerk of the C.C., Shire Hall, Durham, not later than Jan. 6.

Jan. 7. BRACEBRIDGE HEATH.—Contract No. 4.—Construction of an absolutely watertight covered concrete service reservoir of 6,000,000 gallons capacity, and subsidiary works at Bracebridge Heath, near Lincoln, for the Lincoln Corporation. Drawings may be seen, and specification, bill of quantities, and form of tender obtained at the office of N. McK. Barron, Waterworks Engineer, Lincoln, upon payment of the sum of £5 5s. Sealed tenders, endorsed "Tender for Reservoir," and addressed to the Chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, deputy town clerk, Bank Street, Lincoln, on or before Jan. 7.

Jan. 7. WESTGATE, Lincoln.—Contract No. 5. Construction of a brick tower 106 ft. high to T. W. L. to support a spherical bottomed steel tank, containing 300,000 gallons of water, and subsidiary works, at Westgate, Lincoln, for the Corporation. Drawings may be seen, and specification, bill of quantities, and form of tender obtained, at the office of the engineer, Mr. N. McK. Barron, Waterworks Engineer, Lincoln, upon payment of the sum of £5 5s. Sealed tenders, endorsed "Tender for Water Tower, Section No. 1," and addressed to the chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, deputy town clerk, Bank Street, Lincoln, on or before Jan. 7.

Jan. 7. WATFORD.—Erection and completion of a new manual instruction centre at the Victoria Senior Boys' County Council School at Watford, for the Education Committee. Persons desirous of tendering for the work may see the drawings, specification, agreement, etc., at the County Surveyor's Office, Hatfield, on or after Dec. 18, between the hours of 10 a.m. and 4 p.m. (except on Saturday, when they may be seen from 10 a.m. till 12 noon). A copy of the schedule of works (quantities) and a form of tender can be obtained at the County Surveyor's Office on or after the above-mentioned date upon payment of £2 2s. Sealed tenders, endorsed "Tender for Manual Instruction Centre, Watford," must be delivered to U. A. Smith, county surveyor, County Surveyor's Office, Hatfield, not later than 5 p.m. on Jan. 7.

Jan. 14. LITTLE COATES, LINCOLN.—Building an Elementary School at Little Coates, in the county of Lincoln, for the Lindsey C.C. Education Committee. Bills of quantities and form of tender may be had on application to Scorer and Gamble, architects, Bank Street Chambers, Lincoln, on or before Dec. 31st, and on payment to them of £2 2s. The drawings and conditions of contract may be inspected at the offices of the architects. Tenders must be delivered to S. M. Grant, Secretary, 286, High Street, Lincoln, in the envelope provided for that purpose, before 10 a.m. on Jan. 14th.

Jan. 14. HEALING, LINCOLN.—Building an Elementary School and Teacher's House at Healing, in the county of Lincoln, for the Lindsey C.C. Education Committee. Bills of quantities and form of tender may be had on application to Scorer and Gamble, architects, Bank Street Chambers, Lincoln, on or before Dec. 31, and on payment to them of £2 2s. The drawings and conditions of contract may be inspected at the offices of the architects. Tenders must be delivered to S. M. Grant, secretary, 286, High Street, Lincoln, in the envelope provided for that purpose, before 10 a.m. on Jan. 14.

Jan 14. INGOLDMELLS, LINCOLN.—Building an Elementary School and Teacher's House at Ingoldmells, in the county of Lincoln, for the Lindsey C.C. Education Committee. Bills of quantities and form of tender may be had on application to Scorer and Gamble, architects, Bank Street Chambers, Lincoln, on or before Dec. 31st, and on payment to them of £2 2s. The drawings and conditions of contract may be inspected at the offices of the architects. Tenders must be delivered to S. M. Grant, Secretary, 286, High Street, Lincoln, in the envelope provided for that purpose, before 10 a.m. on Jan. 14.

Jan. 18. MACCLESFIELD.—Erection of two detached blocks for 43 patients each at the Parkside Asylum. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., county architect, Chester, and quantities obtained on deposit of £1. Tenders are to be delivered to A. C. Procter, clerk to the Visitors, 23, King Edward Street, Macclesfield, at or before 10 a.m. on Jan. 18, endorsed "Tender for Detached Blocks, Parkside Asylum."

Jan. 18. MACCLESFIELD.—Erection of two detached blocks for forty-three patients each at the Parkside Asylum, Macclesfield. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., county architect, Chester, and quantities obtained on deposit of £1. Tenders are to be delivered to A. C. Procter, clerk to the Visitors, 23, King Edward Street, Macclesfield, at or before 10 a.m. on Jan. 18, endorsed "Tender for Detached Blocks, Parkside Asylum."

No date. WHITCHURCH. — Erection of Stabling at Hepstay House, Whitchurch. Plans and specifications can be seen of D. E. Jones, Hepstay House, Whitchurch, Glam.

No date. RATHBONE.—Building an addition to residence of A. Aylmer, J.P., Rathmore, in accordance with plans and specifications which may be seen at the office of F. Bergin, B.E., 36, Westmoreland Street, Dublin.

No date. LLANDDANIEL.—Erection of a Church Room at Llanddaniel, near Gaerwen, Anglesey. Copies of plans and specification may be seen on application to R. Hall, F.R.I.B.A., architect, Masonic Chambers, Bangor.

No date. DUNSTON.—Erection of the new Dunston Excelsior Club. Builders willing to tender please forward their names to White and Stephenson, Grey Street, Newcastle, or to the secretary of the above club, Dunston.

No date. WHITBY.—Erection of proposed residence, Carr Hill, Whitby. Contractors desirous of tendering for the above works must apply to H. G. Walker, architect and surveyor, Golden Lion Bank, Whitby, when quantities will be sent them when ready.

No date. BRONDEGWYN. — Forming playgrounds and building boundary walls at Brondegwyn Council School, for the Merioneth Education Committee. The plan and specification may be obtained on application to Deakin and H. Jones, architects, Plas Ynys, Borth, R.S.O.

No date. CAERPHILLY.—Erection of two chapels, one to be built at Taff's Well Cemetery and the other at Penyrheol Cemetery, for the Caerphilly D.C. Plans and specifications may be seen and quantities obtained at the office of S. Williams, M.S.A., architect, Borough Chambers, Wharton Street, Cardiff, or at Rectory Road, Caerphilly. Sealed tenders to be sent to W. Spickett, clerk of the Council, Council Offices, Caerphilly, endorsed "Tender for Chapels."

ENGINEERING.

Dec. 17. LEEDS.—New heating apparatus for several of the Council Schools. Contractors desirous of tendering are requested to apply to the Architect's Section, when specifications and full particulars will be forwarded. Tenders are to be sent to J. Graham, secretary for Education, Education Department, Calverley Street, Leeds, not later than 10 a.m. on Dec. 17, endorsed "Tender for Heating Apparatus for Schools."

Dec. 17. CARDIFF.—Re-construction of Monthermer Road Bridge, crossing the Rhymney Railway in the city of Cardiff. Drawings, specification and bill of quantities may be seen at the office of W. Harpur, M.I.C.E., city engineer, City Hall, and copies of the same, with form of tender, may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Monthermer Road Bridge," to be delivered at the office of J. L. Wheatley, town clerk, City Hall, Cardiff, not later than 10 a.m. on Dec. 17.

Dec. 21. BARNET.—Supply, erection, and setting to work of certain pumping plant, comprising borehole pump driven by oil or gas engine, for the Guardians of the Barnet Union. Further particulars and form of tender, may be obtained at the office of the engineer, J. C. Melliss, M.Inst. C.E., 264, Gresham House, Old Broad Street, London, E.C., on payment of the sum of £2. Tenders properly endorsed, are to be delivered to G. D. Byfield, clerk to the guardians, clerk's office, High Street, Barnet, Herts, at or before noon on Dec. 21.

Dec. 22. BURNLEY.—Widening of the Bridge carrying the railway over Cog Lane, and Construction of Retaining Walls adjacent thereto, at Gannow Junction, Burnley, for the directors of the Lancs. and Yorks. Railway. Plans can be seen, and copies of tender, quantities, and specification obtained, on application at the Engineer's Office, Hunt's Bank, Manchester. Tenders, endorsed "Tender for Widening Bridge over Cog Lane, etc.," Burnley," to be in the hands of R. C. Irwin, secretary, Hunt's Bank, Manchester, not later than ten o'clock on the morning of Dec. 22nd.

Dec. 23. BRADFORD.—Supply and erection of two 3,000 k.w. turbo-generators, complete with condensing plant, motor-driven auxiliaries, and steam, exhaust and circulating pipework, for the Corporation. Copies of the specification, general conditions of contract, and forms of tender, may be obtained from T. Roles, city electrical engineer and manager, Electricity Offices, Whitaker Buildings, Bradford, on payment of the sum of £2 2s. Sealed tenders, on the forms, must be sent fully filled in to F. Stevens, town clerk, Town Hall, Bradford, not later than the first post on Dec. 23, endorsed "Contract 'R. 6'." Fair wages clause.

Dec. 30. LIMERICK.—Supplying and setting one steel Cornish boiler, 20 ft. long and 6 ft. diameter, for 80lbs. working pressure, for the Water Committee at their works at Reboge. Particulars may be obtained on application to J. J. Peacocke, B.A., B.E., city surveyor, Town Hall, Limerick. Tenders must be delivered by noon on Dec. 30, to W. J. DeCourcey, secretary, Water Committee, Town Hall, Limerick.

Dec. 30. LONDON, S.E.—Supplying and fixing a 150 shirt capacity washing machine at their workhouse, Prince's Road, Kennington Road, S.E., for the Guardians of the Poor of the parish of Lambeth. A general description of the work required, together with form of tender, can be obtained from the office of J. L. Goldspink, clerk to the guardians, Guardians' Board Room and Offices, Brook Street, Dennington Road, S.E.. The tenders, which must be sealed and superscribed "Tender for Washing Machine," must be sent to the clerk to the Guardians, or placed in the box provided for their reception in the office of the clerk to the guardians by the contractors or their representatives, if they so desire, on or before 10 o'clock on Dec. 30, and will be opened in the board room at noon on that day.

Jan. 2. LETTERKENNY.—Carrying out of the Lough salt water scheme for supplying the Letterkenny Urban District and the Donegal District Asylum for the water for the U.D.C., in accordance with plans and specification deposited at the office of the Council, Main Street, Letterkenny, where same can be inspected by intending contractors. The works include the following:—(1) Intake well at Lough Salt; (2) The supplying and laying of 9 miles 520 yards of 5-in. C.I. main, from Lough Salt to the Asylum Tank at Windy Hall, Letterkenny, with the necessary valves, etc.; (3) alterations at tank and connection of supply to Asylum and town; (4) Supplying and laying 5-in. C.L. main from tank to connect to town service; (5) The maintenance of the works for 12 months after completion. The contractor will be required to enter into a bond with at least two solvent sureties in the penal sum of £5,000 for the due performance of the contract. Tenders will be received by J. G. Larkin, town clerk, Town Council Office, Main Street, Letterkenny, up till five o'clock p.m., on Jan. 2nd, and will be considered by the Council at their meeting on Jan. 14th, at 12 o'clock noon.

Jan. 4. GREAT BERKHAMPSTEAD.—Reconstruction of King's Road Bridge, for the U.D.C. The removal of the existing iron superstructure, carrying the King's Road over the Grand Junction Canal, and the erection of a new steel bridge. The plans and specification can be inspected, and form of tender obtained at the offices of E. H. Adey, surveyor to the U.D.C., 177, High Street, Berkhampstead, Herts, or Thomas and Thomas, civil engineers, 191, Edgware Road, Paddington, W. Tenders to be sent in envelopes, endorsed "Tenders for Bridge," on or before noon on Jan. 4th, to the office of the surveyor.

Jan. 7. WESTGATE, Lincoln.—Contract No. 6. Supply and erection of an absolutely watertight steel tank of 300,000 gallons capacity, and subsidiary works, at Westgate, Lincoln, for the Corporation. Drawing, specification, and form of tender may be obtained at the office of the engineer, N. McK. Barron, Waterworks Engineer, Lincoln, upon payment of the sum of £5 5s. Sealed tenders, endorsed "Tender for Water Tower, Section No. 2 Tank," and addressed to the chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, deputy town clerk, Bank Street, Lincoln, on or before Jan. 7.

Feb. 22. SYDNEY, N.S.W.—Supply and erection in Sydney of five water-tube boilers, each capable of evaporating 24,000 lbs. of water per hour, with economisers, stokers, feed pumps, pipework, etc., for Preece and Cardew, on behalf of the Sydney Municipal Council. Tenders for the whole of the plant only will be considered. Specification, drawing, and form of tender may be obtained from Preece and Cardew, 8, Queen Anne's Gate, Westminster, S.W., on payment of a deposit of £1 1s. Extra copies of the specification may be obtained on payment of 7s. 6d. each (not returnable). A cash deposit or marked cheque for the sum of £1,000 will require to be deposited with the

city treasurer, Town Hall, Sydney, when the tender is sent in. Sealed tenders, endorsed "Tender for Electric Lighting Plant," are to be addressed to the Town Clerk, Town Hall, Sydney, N.S.W., and must be delivered at the Town Hall, Sydney, not later than 4 p.m. on Feb. 22.

IRON AND STEEL.

Dec. 23. LONDON, E.—Works in connection with certain new gates and iron fencing, etc., at the Forest Gate Branch Workhouse, for the Guardians of the Parish of the Poplar Borough, in accordance with specification prepared by their architects, J. and W. Clarkson, 136, High Street, Poplar, E. Persons desirous of tendering for the work must send their names to the architects not later than Dec. 16. The conditions of contract and a copy of the specification and form of tender may be obtained upon payment to the architects of a deposit of £2 2s. Tenders, sealed and endorsed "Tender for Gates, Fencing, etc., at the Forest Gate Branch Workhouse," addressed to G. H. Lough, clerk to the Guardians, 45, Upper North Street, Poplar, E., must be delivered not later than 6.30 p.m. on Dec. 23. Securities required. Fair wages clause.

Jan 5. LONDON, E.C.—Supply and delivery of 40 through spans of 150 ft., for the Bengal and North-Western Railway Co., Ltd., as per specification to be seen at the Company's offices. Tenders, addressed to A. Izat, managing director, 237, Gresham House, Old Broad Street, London, E.C., and marked "Tenders for Spans," are to be lodged not later than noon on Jan. 5. For each specification a fee of 20s. will be charged, which cannot, under any circumstances, be returned.

Jan. 5. BLACKROCK (Co. Dublin).—Supply of the following goods for the U.D.C.: 3,200 yds. lin. 6 in. watermains, 660 yds. lin. 4 in. watermains. To be delivered at such places in the Blackrock District as the Council may direct. Specification for the pipes can be seen at the Town Hall. As far as possible all goods must be of Irish manufacture. Tenders, which are to be on the prescribed forms, and accompanied by the schedule of prices, for specials, must be lodged with R. F. Heron, town clerk, Town Clerk's Office, Town Hall, Blackrock, Co. Dublin, on or before 4 p.m. on Jan. 5.

PAINTING.

Dec. 19. WIGAN.—Cleaning, Painting, etc., of the interior of the first-class Swimming Bath, for the Wigan Corporation. Specification can be seen and other information obtained, at the office of the borough engineer, King Street West. Tenders, endorsed "Baths Painting," to be delivered to H. Jevons, town clerk, Town Clerk's Office, Wigan, not later than Dec. 19.

PLUMBING & SANITARY

Dec. 17. CORK.—Execution of the following works, according to plans and specifications, which may be inspected at the Boardroom, Cork Workhouse, for the R.D.C. (a) Laying sewer, building manhole, etc., at Glanmire Village; (b) cleaning out and deepening existing well, and erecting pump at Barnagore, Ovens; (c) repairing well, supplying and erecting new pump at Coolmore, near Ringaskiddy; (d) enclosing well at Glenville. Each tender must be made on the official form and be signed by the person proposing to execute the work, and contain the names and addresses of two solvent persons who are willing to join with him in a bond for the execution of the work. Forms of tender may be obtained on application at the Boardroom, Cork Workhouse. Tenders will be received up to the hour of 12 o'clock noon on Dec. 17.

Dec. 19. HALIFAX.—Construction of about 150 yds. of 5ft. by 3ft. 4in. brick sewer. Plans, etc., may be seen, and forms of tender obtained, on application to J. Lord, M.I.C.E., borough engineer, Town Hall, Halifax, upon deposit of £10. Tenders are to be delivered by Dec. 19.

Dec. 19. KING'S LANGLEY.—Constructing new Precipitating Tanks in connection with the sewage system at Leavesden Asylum, King's Langley, near Watford, Herts, in accordance with drawing, conditions of contract, and specification prepared by W. T. Hatch, engineer-in-chief. The drawing, conditions of contract, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon payment of a deposit of £1. Tenders addressed as noted on the form must be delivered at the office of the Board not later than ten a.m. on Dec. 19th.

Dec. 19. ORRELL.—Construction of surface and foul water pipe sewers for the drainage of the Estate; comprising about 2,300 yds. of pipes from 5 in. to 24 in. diameter, passing under railways and under the St. Helens Canal, and works in connection therewith, for the owners. Plans and specifications may be seen and form of tender and bill of quantities obtained at the office of Chase and Broom, 67, Dale Street, Liverpool, on payment of £1. Tenders must be sent to L. H. Chase, M.I.C.E., at the above address, and delivered not later than 12 o'clock on Dec. 19.

Dec. 28. TIPTON.—New sewage disposal works in the district of Tipton, for the U.D.C. The works will comprise the construction of screening and detritus chamber, tanks, sewage filter beds, storm-water filter, effluent drain, and sludge area, together with other works. Drawings and specifications may be seen, and quantities, form of tender, and all other particulars obtained on application at the offices of Dodd and Dodd, civil engineers, 37, Waterloo Street, Birmingham, on payment of a sum of £5 5s. Tenders, endorsed "Tender for Bacterial Filters," to be delivered, or sent, so as to be in the hands of J. H. Stockdale, clerk, Public Offices, Owen Street, Tipton, not later than 12 o'clock noon on Dec. 28.

Dec. 28. BURSLEM, STAFFS.—Construction of about 800 lin. yrds. of storm water pipe sewer, varying from 15 in. to 30 in. in diameter, together with the manholes and other work in connection therewith from Nile Street and the junction of Park Road with Moorland Road, within the borough, for the Corporation. Plan and specification can be seen, and quantities obtained, at the offices of F. Bettany, borough engineer and surveyor, Queen Street, Burslem, on payment of £2 2s. Fair wages clause. Sealed tenders endorsed "Storm Water Sewer, Moorland Road," to be sent to A. Ellis, town clerk, Town Hall, Burslem, by 5 p.m. on Dec. 28th.

Dec. 30. TROON.—Providing a supply of water from Loch Bradan, for the Troon Town Council:—Contract No. 3.—For excavating for and building a dam of concrete and masonry across the outlet of Loch Bradan, a valve tower of concrete and masonry in Loch Bradan, a waste water channel, gauge and screening wells, a gauge well, and pipeage for compensation water and other relative works. Contract No. 4.—For cutting and filling trenches, carting, laying and jointing 18in. diameter concrete, and 16, 14, 12, and 10in. diameter cast-iron pipes for leading water through Ayrshire from Loch Bradan, in Straiton Parish, to Collenan Reservoir, in Dundonald Parish, and other relative works. The Town Council reserve the power to make one or more contracts of the four following sections of this work:—(No. 1) From the gauge well at Loch Bradan to the public road near Grimmet Farm Steading, a distance of about 7 miles 459 yds., through hill country. (No. 2.) From Grimmet to the junction of roads near Kerse Bridge, a distance of about 7 miles 850 yds., partly through moorland and fields, and partly along roads. (No. 3.) From the junction of roads near Kerse Bridge to Annbank Station, a distance of about 7 miles 980 yds., chiefly along the public roads. (No. 4.) From Annbank Station to Collenan Reservoir, a distance of about 6 miles 1,564 yds., chiefly through fields. Copies of the specification, schedule of quantities, and form of tender for each contract, may be obtained from J. and H. V. Eaglesham, engineers, 24, Wellington Square, Ayr, on payment of £2 2s. Tenders endorsed, "Tender for Contract No. 3, Loch Bradan," or No. 4, as the case may be, to be delivered at the office of R. Young, town clerk, Town Clerk's Office, Troon, by 4 o'clock p.m. on Dec. 30.

January 8. NORTH TAWTON.—Construction of a concrete service reservoir, aand extension of water mains at North Tawton, Devon, for the Okehampton R.D.C., according to plans prepared by H. Geen, A.M.I.C.E. Plans, specifications, and bill of quantities may be inspected at the Parish Council Office, North Tawton, between the hours of 10 a.m. and 4 p.m. Sealed and endorsed tenders, on forms to be obtained at the R.D.C. Office, Okehampton, must be delivered to S. Hawken, clerk of the council, Okehampton, by Jan. 8.

ROADS AND CARTAGE.

Dec. 19. LEVENSHULME.—Sewering, draining, paving, flagging, curbing, channelling, and completing the following streets and passages, for the U.D.C. in their district:—Dixon Street Extension, Parker Street, passage rear of 180 to 202, Stockport Road and 2 to 22, Parker Street, Molyneux Road, Cecil Street, Bute Street, Victoria and Alexandra Avenues, passages rear of Barlow Road, Emley Street, and King Edward Street, and passage Marshall Road. Specifications, bills of quantities, and further particulars may be obtained on application to J. Jepson, Mosley Chambers, 35, Great Underbank, Stockport, surveyor to the Council, on payment of £3 3s. Tenders, endorsed "Tender for Private Street Works," to be sent to J. O. Hardicker, clerk to the Council, Northern Assurance Buildings, Albert Square, Manchester, not later than Dec. 19th.

Dec. 22. GATESHEAD.—Paving, etc., the following streets:—Primrose Hill, Back Grasmere Street West (paving), Keswick Street and Back Hawthorn Gardens (tar macadam). Plans and specifications may be seen and quantities obtained at the office of N. P. Pattinson, borough engineer, Town Hall, Gateshead. Tenders are to be sent in sealed and endorsed "Tenders for Street Paving" on or before 2 p.m. on Dec. 22.

Dec. 22. FARNHAM, Surrey.—Supply of Clee Hill basalt, Penmaenmaur, Guernsey, and quenast granite, for the Farnham U.D.C. The granite to be well and roundly broken, free from chips and small pieces. Forms of tender may be had from R. W. Cass, council's surveyor, Council Offices, South Street, Farnham, Surrey. Tenders to be sent on the prescribed forms only, with samples as to quality, size, and breaking, in each case. Tenders to be endorsed "Granite," on the outside cover, and to be delivered to R. Mason, solicitor, clerk to the Council, 93, West Street, Farnham, on or before 4 o'clock p.m., on Dec. 22.

Dec. 30. ERDINGTON.—Supply of broken stone during the year 1909, for the Highways and Buildings Committee. Specification, form of tender, and all information may be obtained upon application at the offices of H. H. Humphries, surveyor to the Council, Council House, Erdington, to whom tenders must be delivered not later than 12 o'clock at noon on Dec. 30. Fair wages clause.

Dec. 30. OLD HILL. — Forming, metalling, paving, and making the new extension of Plant Street, Old Hill. Plan, specification, and conditions may be seen at the Council Offices, Old Hill, between the hours of 10 a.m. and 4 p.m. (Saturdays from 10 a.m. to 1 p.m.). Tenders, duly endorsed, must be in the hands of D. Wright, clerk, Council Offices, Old Hill, Staffordshire, not later than 12 o'clock noon on Dec. 30.

Dec. 31. HORSHAM.—Supply of:—1, picked surface flints, delivered on the main road; 2, broken quartzite, granite, or other stone, to Shoreham Harbours, and to railway stations; 3, cartage from railway stations, wharves, and stone pits to main roads, and team labour per day; 4, tar, for the year ending March 31, 1910, for the Roads and Bridges Committee. Forms of tender may be obtained on application to H. W. Bowen, county surveyor, County Surveyor's Office, 22, Worthing Road, Horsham, and applicants are requested to state which form of tender (1, 2, 3, or 4) they require. Sealed tenders, endorsed "Tenders for Materials," or "Tenders for Cartage," to be delivered to the county surveyor, on or before Dec. 31.

MISCELLANEOUS.

Dec. 21. ERDINGTON.—Supply of the following materials in connection with the construction of the enlargement of Short Heath Intercepting Sewer, for the Highways and Buildings Committee. Contract No 1. Bricks and invert blocks; 2, iron pipes and special castings; 3, cement; 4, timber. Specifications, forms of tender, and all information may be obtained upon application to H. H. Humphries, engineer to the Council, Council House, Erdington, to whom tenders must be delivered not later than 12 o'clock noon, Dec. 21. Fair wages clause.

Dec. 21. FULBOURN, Cambs.—Supply of oils, oil colours, window glass, etc., for six calendar months, from Jan. 1, for the committee of Visitors for the Cambridge County Lunatic Asylum. Tenders (and samples where practicable) to be delivered to H. Archer, steward, at the asylum before 12 o'clock at noon on Dec. 21, for examination by a sub-committee. All articles are to be delivered free of expense by the respective contractors. Forms of tender may be had at the office of T. M. Francis, clerk to the Visitors, 18, Emmanuel Street, Cambridge, or of Mr. Archer, the steward, at the Asylum.

SLATE MERCHANTS AND BUILDERS' MERchants.—Experienced traveller (with 14 years' connection Midlands), desires re-engagement; at liberty middle of December; or could arrange earlier.—Address, Slate, c/o Secretary, Builders' Exchange, Sheffield. 4624

SLATING and tiling wanted (labour only) day or piece; any quantity, large or small; distance no object.—Mack, Slater and Tiler, 3, Granville Cottages Tower Hamlets Street, Dover. 4619

SHOP or General Foreman, long West-end experience, used to alterations and repairs; understands stairs; used to good jobbing work. Address A., c/o Mr. Seymour, 14, Allsop Place, Regent's Park, N.W. 4581

TO Builders.—Situation as improver wanted by young man just out of his time; technical student; neat draughtsman; assist with quantities, supervision, etc.; abstainer. — Box 4662, BUILDERS' JOURNAL Office.

TO Estate Owners.—Builder (38), varied experience, desires position as agent or clerk of works, surveys, plans, quantities, setting out, accounts and supervision; country preferred.—Box 4594, BUILDERS' JOURNAL Office.

TRAVELLER.—Architect desires post as representative to good firm. — Address Box 4497, BUILDERS' JOURNAL Office.

Appointments Vacant.

AGENT, with slight knowledge structural engineering, wanted by well known firm to introduce sale of speciality on commission, in Southampton and district, gentleman having connection among architects, surveyors, and engineers preferred.—Write Reinforced Concrete, c/o Brown's Advertising Office, 17, Tothill Street, Westminster. 4732

CLERK required by architect, typewriting and shorthand; state experience and salary.—Box 4754, BUILDERS' JOURNAL Office.

LONDON Quantity Surveyor wants experienced Assistant, thoroughly practical; must be able to take off and measure up well; state age, references and salary to Box 4757 BUILDERS' JOURNAL Office.

WANTED, immediately, a first-class active all-round architect's assistant, with considerable experience in public, elementary, and secondary school planning. He must also be an expeditious draughtsman, capable of writing specifications and checking accounts. Preference given to one capable of preparing a complete bill of quantities (London system), up to at least £10,000. Salary not to exceed three guineas per week, payable monthly. Apply stating full particulars and testimonials (copies) to D. Pugh - Jones, County (School) Architect, 62, Charles Street, Cardiff. 4731

December 23, 1908. Volume 28. No 724.

Building Accidents Bill Withdrawn.

The Building Operations and Engineering Works Bill, at the introduction of which Mr. Gladstone said that the main hope of its becoming law this year was that it should be considered non-contentious, has been dropped. The inference is that contention has arisen. In our review of the Bill in August last, various suggestions were made as to the advisability and otherwise of certain of its provisions. We particularly pointed out that while the handing over to the local authorities of powers now exercised by the Factory Inspectorate had some advantages, yet the devolution of these powers from a central authority to many minor bodies tended on the whole to divergent practices in administration. It is true powers were retained for the factory inspectors to act where the local authorities were found negligent, but this did not help matters, but only served to render confusion worse confounded. It is probable that upon these two points—the administration by the District Councils and the dual control mentioned—the contention has arisen. We believe representations have been made to the Home Office giving effect to these objections; but as the second reading of the Bill in the House of Commons did not occur, it is impossible to say whether any of the members who are connected with or interested in the building trade were prepared to give voice to them there. However, the Bill is withdrawn, ostensibly because of the extremely short time left after the major Bills have been considered, which it has been thought claimed greater attention. Mr. Gladstone is credited with the intention of reintroducing the measure early next year. The delay will give him an opportunity of considering the points raised. It is somewhat difficult to know upon whose advice he relies in drafting such measures. The matter of administration was considered by the Home Office Committee, which sat last year to draw up the regulations for safety, although it was not strictly within their duties. The evidence on the whole was in favour of the factory inspectors retaining their existing powers, and with this we believe the whole of the trade would agree. The master builders principally object to the dual control, and the trades unions concerned demand the central authority. Surely, when all are so much in agreement, the Home Secretary can find means to give effect to their desires. There should be no reason for delay in doing this. A certain amount of public interest exists apart from that felt in the trade itself. The number of fatal accidents on buildings that occur each year would, if occurring on a battlefield, send a shock throughout the country. The desire to remedy this state of affairs as far as possible is of old standing, and it is to be hoped that no unnecessary delay will arise in giving effect to it.

"Mind the Paint."

Practical joking is justly reprehended. It is always mischievous, frequently dangerous, and sometimes fatal. It seems that there are those who regard a joke on practical matters as being almost equally despicable. Mr. E. R. E. Sutton's jocular request, in an after-dinner speech, for information as to how he could tell when painters had put on four coats or only three, has given rise to an almost acrimonious correspondence in the "Nottingham Guardian." A gentleman signing himself "Painter" thinks that "it may be open to question whether it is good taste, or a keen sense of humour, on the part of an architect to ask such a question from a body of men whose guest the questioner was for the time being." He adds, however, that the answer to the question is very simple:—"1. Only employ tradesmen of established reputation. 2. Never accept prices which he knows from experience cannot cover the cost of the work demanded." Excellent advice, no doubt, although No. 2 seems to have the effect of "thinners" on No. 1. In reply to this letter, Mr. G. T. Shearman, hon. secretary of the National Association of House Painters, solemnly declares that he has been requested by the association to reply to the letter. The writer of that letter, he says, "evidently was not at the dinner, or he would, without he is extremely dull of comprehension, have apreciated Mr. E. R. E. Sutton's humorous remarks, which were in reply to the previous speech, and were taken as such by those present at the meeting, and also by your reporter." "Another Painter," replying to "Painter," starts another hare. "Does 'Painter'" he asks, with what seems to us to be a tone of withering scorn, "think that the above association, or even the Executive Committee, represent firms which guarantee a proper number of coats of paint or standard class of work? One would imagine by his letter that the Master Painters' Association was composed of all the integrity and talent of the city." Clearly Mr. Sutton has upset the painters, if not the paint. Truly the fortune of a jest rests with the hearer! Mr. Sutton has our sympathy, and we wish him better luck with his next joke.

Sculpture and Building.

The adornment (or otherwise) of the Thames-side by means of statuary is to be assisted by no less eminent an artist than Auguste Rodin. Since the death of James McNeil Whistler, in 1903, the International Society of Painters, Sculptors, and Engravers, of which that wayward and whimsical and sufficiently international artist was president, have been collecting funds with the object of raising a memorial to him, and their quiet and more or less private appeal has resulted in the not unhandsome sum of £4,000. M. Rodin, who is now president of the Society, was induced to undertake the execution of the memorial, and has already made good progress with the work. It shows the figure of Fame, holding a medallion portrait of Whistler, and the shade of that cynical master of epigram may without irreverence be imagined as commenting, "Yes, Fame holds Whistler; but does Whistler hold Fame?" The man in the street, on whose habitat the statue is to intrude, will probably find in it a fresh cause of puzzle-headed perplexity. He will probably disapprove of it on the erroneous supposition that since it is to be put up in the little park on the Chelsea Embankment, where there is already a statue of Carlyle, the London County Council is again growing regardless of the ratepayers' pocket, which supposition is absurd, but natural and characteristic: as will be also, it is to be feared, his critical (?) estimate of the peculiarities of Rodin. Replicas of the statue will, it is understood, be erected in Paris and in the United States. The fact somehow reminds us of one of Whistler's stinging retorts on the subject of repetition. Whistler, in company, said something particularly brilliant. "Oh," exclaimed a literary friend, who was notorious in many ways, and particularly for his habit of plagiarism, "how I wish I had said that!" "Never mind!" snapped Whistler, "you certainly will!" The Embankments, failing the spacious squares and avenues in which London is rather conspicuously lacking, afford perhaps the most appropriate sites for statuary; but the examples already in existence hardly stimulate the desire that they should be increased and multiplied in the same kind. Those on the Victoria Embankment, for instance, are by no means worthy of the very respectable architecture by which the heterogeneous collec-

tion of graven images is dwarfed into insignificance. In London generally, the increasing use of sculpture as an integral part of buildings, for the adornment of doorway and pediment and frieze, almost forbids the setting up within sight of them of small statues. Detached sculpture—the memorials of really great personages, or of really great events—should be on the grand scale, and their position and treatment should conform to a well-ordered system of town planning. It would be too much to hope that Mr. Burns's postponed Bill will give us a system deserving this description, so long as he maintains his present attitude towards the R.I.B.A., for in snubbing that body he has temporarily deprived himself of exactly the advice and assistance of which he is most conspicuously in need. A committee of taste would perhaps have prevented the juxtaposition of Whistler and Carlyle, who obviously have nothing in common except their bitter cynicism; but it was not likely that the L.C.C. would look a gift-horse in the mouth.

Technical Training.

Commenting upon a more or less inept proposal to teach handicrafts to schoolboys, Mr. H. Phillips Fletcher, F.R.I.B.A., commends the more admirable method that has been for fifteen years pursued in the Trades Training Schools of the Worshipful Companies of Carpenters, Joiners, Painter-Stainers, Plaisterers, Tylers, and Bricklayers, etc., who encourage men working in the different building trades to perfect themselves in their various crafts. "It appears to me," writes Mr. Fletcher, "that it is infinitely more desirable to improve the technique in the various trades, so that the skilled craftsman may be enabled to compete with the keen foreign competitor, than to flood the labour market with half-trained juvenile labour." He considers that the nation as a whole would benefit more by the improvement of the craftsmen already engaged in the various trades than by an increase of the large number of unemployed already depending on such trades. Although the prevailing idea that the increase of skill would decrease the number of the unemployed has always appeared to us to involve a certain degree of fallacy, there can be no question as to the need for greater skill among our craftsmen; and we think that Mr. Fletcher's praise of such institutions as are working on these lines is no more than just. What is wanted in education of all kinds, and especially, perhaps, in professional and technical education, is not extension, but intensification. The London County Council and the City and Guilds Institute seem to realise this in their exclusion from trade classes of those who are not regularly employed in the trades taught. Their practice in this respect may be the recognition of the principle, or it may be merely a concession to the trades unions.

Architect, Builder, and Contractor.

The architect, it would seem, is really going to be relieved of one of his most invidious duties. The organised builders are determined that he shall be helped out of the embarrassing situation that was thus described by Mr. Stephen Easten when presiding the other evening at the annual dinner of the Tyne and Blyth District Building Trades Federation: "At the present time they had conditions of contract that architects, solicitors, and town clerks considered only fools would sign. In his opinion, there was no more ridiculous position than that of employer or municipal body employing an architect who was their servant, and employing that architect to be the sole arbitrator in the event not only of disputes between the employer and the contractor, but in case of dispute between the architect and contractor." That, in substance, is what the learned judge observes when the case happens to come into court, only he usually expresses himself rather less rhetorically than could be either expected or desired in an after-dinner speech by an interested party. For the anomaly or iniquity, the contractor has only himself to blame. It is essentially his affair; and the reason why he has not until recently insisted on his rights is plain to see. If one contractor objected, it was a simple matter to find another who would consent. Now, however, the contractors are organised, and by working together instead of pulling against each other, are doing much to falsify the proverb that a man's worst foes are those of his own household. We are sure that in most cases the architect will be glad to get rid of so disagreeable a duty as that of which the National form of contract seeks to relieve him. His responsibilities are burdensome enough without it.

Kaiser as Architect.

There was a time when the study of architecture was as much a feature of polite education as was the study of "the uses of the globes." Whether or not the cult still lingers in the highest circles, it is a matter of course that the Emperor of Germany is keenly interested in the subject. Is he not omniscient? He has just shown that in architecture, as in most other matters, he holds strong opinions, and is not backward in asserting them. A new post office for Darmstadt has been designed by the architect of the Postal Department, and his plans, having been approved by the Grand Duke of Hesse, were laid before the Kaiser. The approval by the Grand Duke may have been purely perfunctory—as superficial and careless, perhaps, as Baron Bon Bülow's handling of a certain notorious document. But the Kaiser knows how to read a plan, and thinks he knows how to revise one. He revised this one. For some unexplained reason, the roof did not please him. He insisted on its being entirely changed. One might have supposed that the change would have been made without demur, and that any objections to it would have amounted to *lèse majesté*. But the Municipality of Darmstadt, backed by the Grand Duke of Hesse, has dared to assert that "the Kaiser's roof is impossible on aesthetic grounds," and "the central postal department has rejected it on technical grounds." The central postal department chose the better path. To impugn an emperor's technics may be tantamount to flattering him; to say that his roof is impossible on aesthetic grounds is to incur more risk than a prudent man will willingly run in an autocratic country. We cannot help feeling a certain degree of mild curiosity as to what is the matter with the emperor's roof. Can it be suspected that there is somewhere a tile loose?

Khartoum Cathedral.

That Khartoum, which but a few years ago was the haunt of bloodthirsty dervishes, who then and there did Gordon to death, should now be the site of a cathedral, is an astonishing token of the rapid and resistless march of civilisation. The cathedral, of which the chancel and transepts are now 20ft. above ground-level, has been designed by Mr. R. Weir Schultz, of London, who probably has not thought it necessary to follow the practice of the builders of old, who had to bear in mind that the church must be strong enough to withstand a siege. He is building it, however, of solid stone, doubtless imported, and we are wondering whether the purists who during the past summer raised such an outcry against the incongruous appearance of buildings that were not derived from the soil on which they were reared, will insist that Mr. Schultz ought to have used adobe bricks or homespun canvas! But it is perhaps unfair to push the theory to a logical conclusion, or, rather, to reduce it to absurdity. Within due limits, the contention is undoubtedly sound, and nobody will dispute such a self-evident proposition as that a building should never seem so foreign to its environment as was Sam Weller's "trout in a lime basket." But, no matter how cunningly Mr. Schultz may have adapted his design to the extraordinary circumstances, an Anglican cathedral in the midst of the Soudan is bound to look like an aggressive intrusion from the West. But it is a noteworthy adventure, and the appeal for funds made at a very influential meeting at the Mansion House the other day should ensure the scheme against the pinching privation which has been the ruin of so many ecclesiastical designs. Khartoum cathedral should symbolise power rather than poverty.

IMPORTANT NOTICE.

Next week's number of THE BUILDERS' JOURNAL, dated December 30th, will be a special issue, comprising a copiously illustrated account of English Architecture, a record of the year's doings, including the proceedings of the architectural and other institutions concerned with building, a large number of portraits, some of which are mounted on art paper, of men of note in the profession or the business of building, and other interesting features, besides the usual contents of the journal. The price of the special issue, which comprises about 300 pages, will be one shilling.

Curiosities of Tendering.—Some remarkable contrasts were shown in the tenders for the Lincoln water supply contracts. There were two sets of tenders the first, described as No. 1, being for the sinking of four bore holes at the source of supply at Elkesley, Nottinghamshire and eleven contractors offered to do this work at prices ranging from £22,900 down to £6,700. The tender selected was one from a London firm at £7,768. Contract No. 2 was for two trial bores near Dunham Bridge, on the Trent, for which fifteen tenders were sent in, and the highest was £388 2s., and the lowest £41 10s., while that accepted quoted £42 16s. In the first case the highest tender was three times the figure quoted by the lowest tenderer, and in the second case the highest tender was nine times the price quoted on the lowest tender.

GLAMORGAN COUNTY HALL COMPETITION.

The result of the assessor's award in this competition has been awaited with much interest; seeing that this is the most important public competition that has been held since the early spring. About 200 designs were received in response to the Council's invitation. This large number of competitors was doubtless principally due to the quiet state of the building trade, and the fact that no deposit was required for the particulars was possibly not without effect.

Considering the size of the proposed building, and the cost—about £45,000—the conditions were remarkably brief, not to say inadequate. Only one per cent. will be paid for quantity fees; and there are in the conditions a few clauses that tend to show that the Council or its officials will act as dictators, to the architects' disadvantage. This contingency may be averted in the written contract which the Council will prepare for the successful firm, provided the latter are legally guided and assert their professional rights.

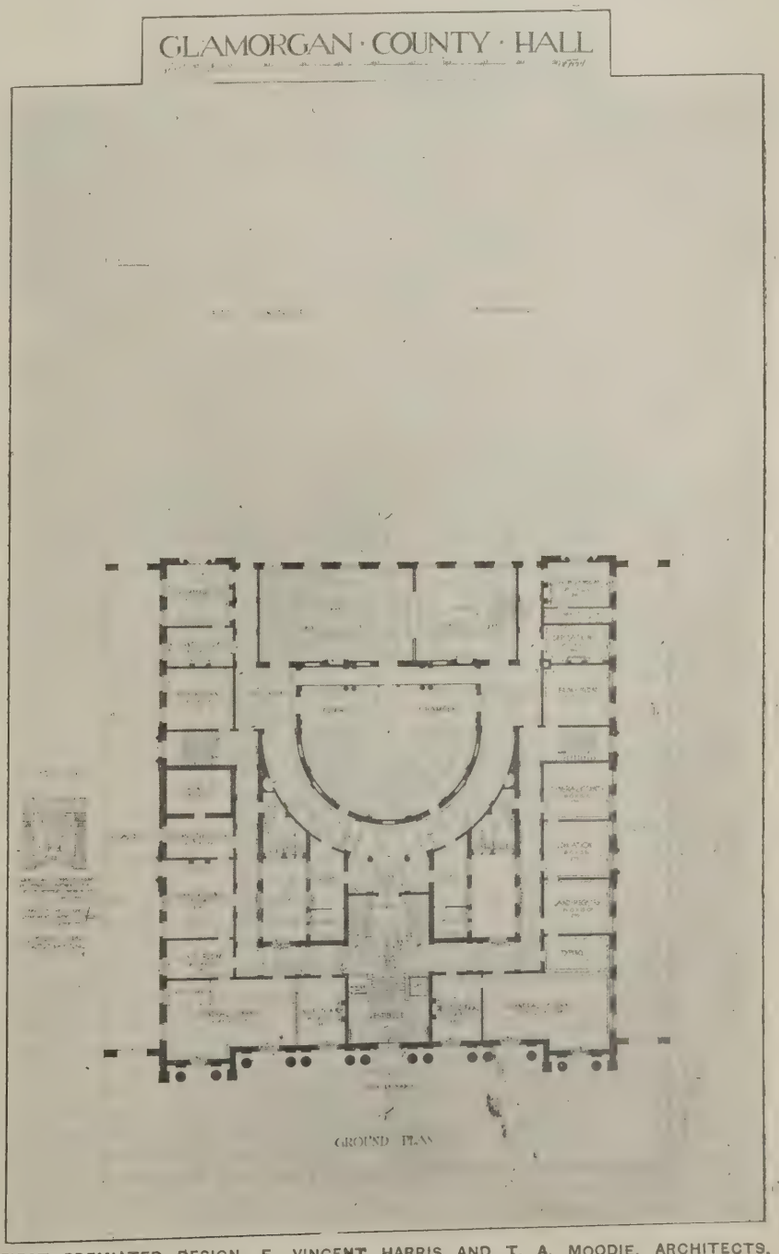
In the conditions of competition, the following accommodation was required: Council hall (88 members and eight officers), two committee rooms, chairman's private retiring room, cloak rooms and conveniences for the use of the Council. The officers' departments included a series of rooms for the clerk of the County Council, accountant, education, surveyor, school architect, and medical officer of health. A proposed future chief constable's department had to be indicated in outline on the plans.

The site is almost ideal, being level and nearly square. It faces the Central Avenue and adjoins the new town hall and law courts. An oak tree on a portion of the site was the chief source of trouble to many competitors, as it had to be left untouched. When the superficial area required for the offices had been worked out, there arose a further problem for the architects. This is noticeable on all the premiated schemes—especially by the small areas and general compactness of the plans.

Taken as a whole, the competition cannot be reckoned an architectural success. We had hoped for a fresher and more original design for the first place—particularly from some of the rising young architects. As to the selection of the second premiated and of many of the honourably mentioned sets, one is at a loss to know the reasons for the assessor's choice. Many leading architects—including the designers of the monumental Town Hall adjoining the site at Cardiff—are known to have submitted carefully thought-out plans, and they are not even mentioned in the short leet. The Glamorgan County Council, however, have confirmed the report of the assessor, Mr. W. D. Caröe, of London. Only ten sets were on view. They include the three premiated designs, and the seven specially mentioned by the assessor.

The First Premiated Design.

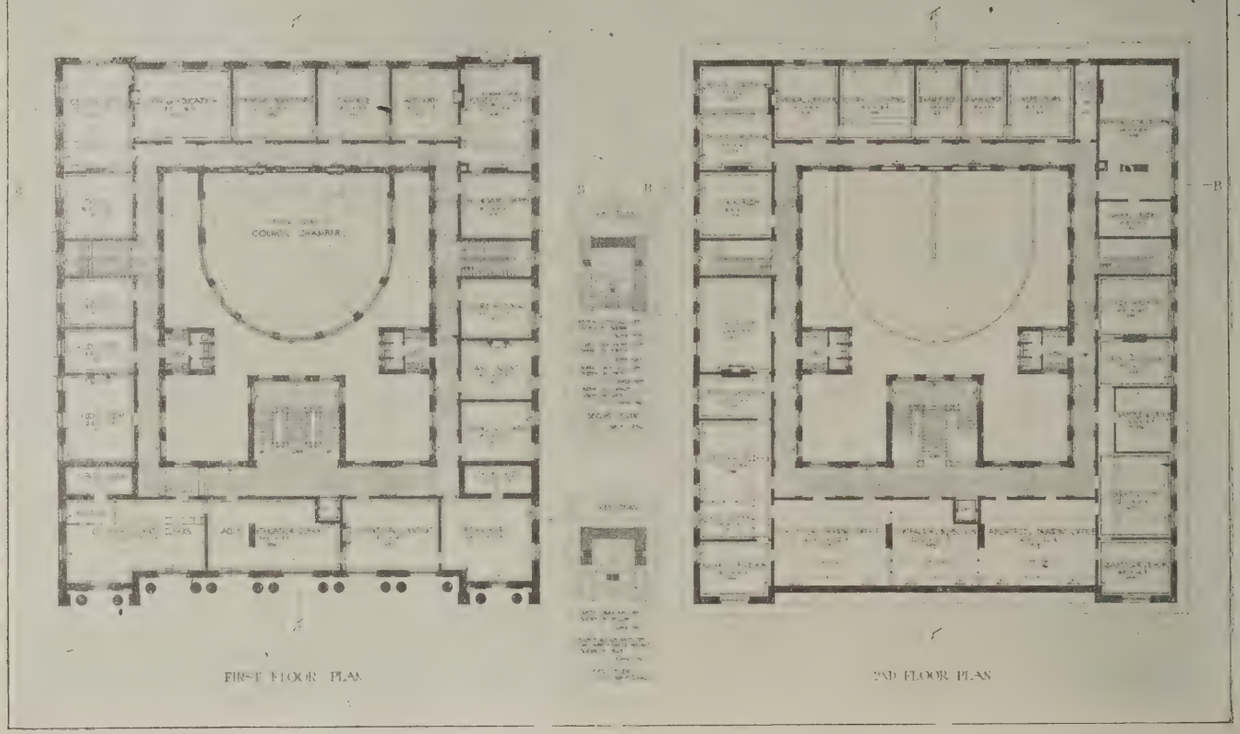
The first position, with premium of £105, has been won by the plans of Messrs. E. Vincent Harris and Thos. A. Moodie, 8, New Square, Lincoln's Inn, London. The scheme shows a simple and well-arranged set of plans, suitable for the requirements of a County Council. It is clearly seen, on reference to the illustrations, that the position of the Council Chamber has naturally ruled the planning. There is also a considerable length of corridor, which does not show at first sight, owing to the private corridors being left white and the public ones coloured grey. In a few instances the corridors are indirectly and badly lighted. The isolation of the council suite from the offices of the clerk to the Council is cleverly worked out for such a limited site.



In the basement floor is the service kitchen, with clerk's dining-room, etc. This is not a satisfactory position for these rooms, especially when the council windows are directly over, on the next floor, and will be sure to receive any odour of cooking which escapes from the kitchen. A feature of the ground floor plan, which is open to improvement, is the arrangement of the vestibule and hall. The former requires a screen to intercept draughts, as the site is an open one, and much exposed.

The want of a lift enclosure in the hall will upset the architectural appearance. A few columns and pilasters, which should form part of the construction, will break up the monotonous look of the plan and sections, and at the same time permit of a dividing draught screen, swing doors, and clothing of lift between vestibule and hall.

On the first and second floors the simplicity of the plans is marred by the front rooms being cut into by the projecting features, and by the flues and lifts.



The architectural treatment of the elevations is rather severe for the size and purpose of the building. A richly detailed Corinthian colonnade faces the main avenue, with side elevations void of interest, and unbroken by any suitable feature. It is all very strictly pure and correct from a Classic point of view, but will look decidedly tame and uninspired when erected and compared with the adjoining buildings.

The half-inch drawing shows that the authors do not intend to be strikingly original in their detail. A comparison of the half-inch and the eighth scale front

DRILL YARD ELEVATION

elevation, shows that the building lacks a good heavy base. The columns in particular require more substantial plinth, or to be approached by a wide flight of steps.

The Second Premiated Design.

The plans of Messrs. Pearson and Milburn, 27, Chancery Lane, London, receive the second premium of £52 10s. A glance at the ground plan of this scheme reveals a simple solution of the problem by one central corridor, showing an I-shape of plan. This has been done to get over the question of light to the side windows, in case of buildings being erected at a later date, and interfering with the lighting of the offices.

Many competitors seriously hampered themselves in the planning by not treating this question broadly, as the site contained no right of light at the sides (general conditions); but answers to queries stated clearly that "it is not expected that very high buildings will be erected thereon."

The upper and lower floor plans of the second premiated design do not work out at all happily. The ground floor in this case is the principal plan, though there is no proper division between the Council and the ordinary offices. The single lift and small badly lighted service stairs will be well crowded when the 88 councillors are retiring. The idea of this main corridor has been most successful in the plans for Harrogate Municipal Buildings, and at Woolwich Town Hall, but did not suit this particular site.

Only two small stairs—apart from one passenger lift—connect the various floors. They are not placed in good positions, are inconvenient for access, and have borrowed lights, which in a public stair constitute an objection that should have condemned this plan.

The upper floor contains one long narrow area, and a few smaller ones, with a wasteful length of corridor. Many of the general offices are badly lighted—mostly through borrowed screen lights.

A tower is shown on the front elevation—which is not required, as the adjoining building has three—and the ornamental details are out of harmony with the best modern work. There is nothing remarkable about this set of drawings to warrant the placing of this design second, and a comparison with the third premiated set will prove our statement to be correct.

The Third Premiated Design.

This is the work of Mr. Henry T. Hare, 13, Hart Street, Bloomsbury Square, London, and receives a premium of £31 10s. This scheme is particularly well arranged—though the plan is not quite as clear and open as the first-placed. This inferiority is caused by the central corridor on the ground floor cutting up the plan too much. Seeing that the site is so narrow, and that it had already two side corridors, we fail to appreciate the use of this central corridor, as its width is not sufficient to give it the grandiose appearance necessary for a central and dignified approach to the council hall. The lavatory accommodation for the councillors could have been placed nearer the ante-room. On the upper floor the committee suite and corridor is broken up with the medical officer's department. We do not care for the circular staff stairs—the shape is bad enough without having them in one flight from floor to floor, with no half-landing.

Rather a large area of each floor plan is utilised by the main stairs and hall. Apart from these small drawbacks, the scheme shows no serious mistake, and, in our opinion runs the accepted design a close second, and should have occupied that position.

The elevations were undoubtedly the finest and most suitable on exhibition. This was one of the few designs where the side elevations were in harmony, and formed a connecting link with the main front, and remained interesting. A delicately rendered half-inch drawing completed an exceptionally fine scheme, which had no equal as far as external appearance was concerned.

Honourably Mentioned Designs.

The most successful among the remaining sets was Messrs. Russell and Cooper's. Unfortunately, the lighting of the ground floor corridors had been sacrificed to secure a cleverly arranged and well-lighted first floor plan. This was one of the few schemes with the council chamber to the front. All the drawings were well prepared, and the elevations were of markedly French feeling.

The finest set of drawings, from the point of view of draughtsmanship, were submitted by Mr. Robert Atkinson, Carshalton. Both the design and plan were cleverly composed, and were drawn in a striking manner.

Messrs. Warwick and Hall's scheme covered too much area, and the exterior was hardly suitable for the situation and surroundings.

A scheme which appeared to have erred in length of corridor, coupled with rather a high building, was that of Messrs. Crouch, Butler and Savage, of Birmingham. The only local set worth considering in the final selection was the work of Mr. Reginald S. Kirkby, of Cardiff, who

has been recently appointed architect to the Bradford corporation.

The design shown by A. Gilbert Scott was semi-domestic in treatment and very ecclesiastical in the proportions of the design, and quite incongruous for such a site. The position allotted to this scheme was fruitful of more adverse criticism than any other set, particularly by architects and competitors who had a special interest in visting the exhibition of drawings.

Notes on Competitions.

Poster for the Building Exhibition, 1909.

The premium of 100 guineas offered by Mr. H. Greville Montgomery M.P., for the best design for a poster in connection with next year's Building Trades Exhibition at Olympia, has been awarded to Mr. George Denham, Kensington, W., an architectural student at the Royal College of Art. The adjudicators, Mr. Ernest George, P.R.I.B.A., Sir Aston Webb, R.A., and Sir George Frampton, R.A., were unanimous in their award. Some 200 designs were sent in, and they will be exhibited at the Building Trades Exhibition, which is open from April 17th to May 1st. The successful design is illustrated on page 502.

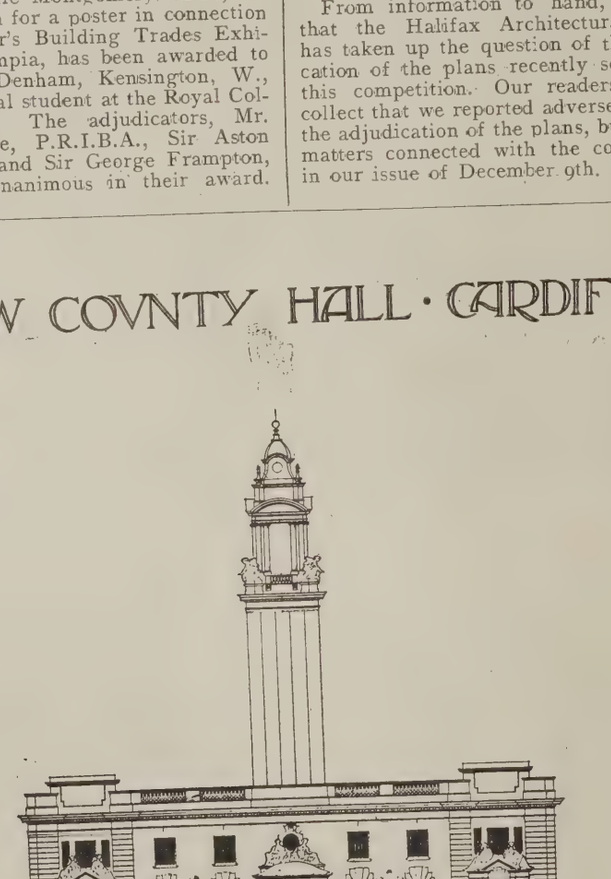
South Bank-in-Normanby New Council Offices, etc.

The Council of the Royal Institute of British Architects has issued a notice to the members requesting them to refrain from competing in this competition. We drew attention to the offending clause in the conditions in our issue of December 2nd.

The Glamorgan County Hall.

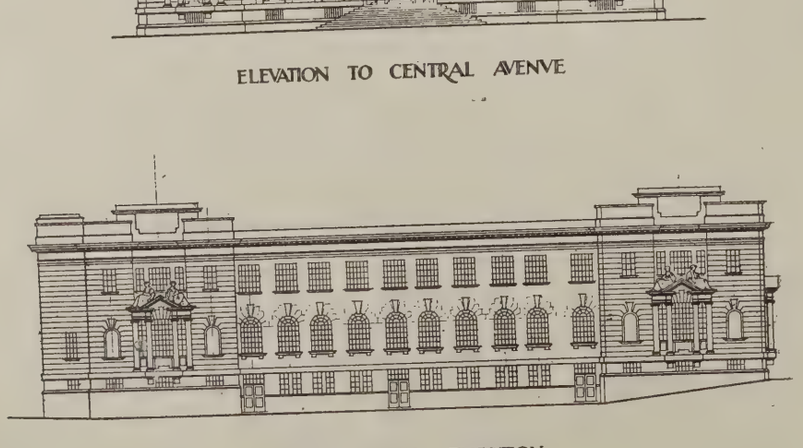
This competition is dealt with on another page.

Brighouse Secondary School.



From information to hand, we learn that the Halifax Architectural Society has taken up the question of the adjudication of the plans recently sent in for this competition. Our readers will recollect that we reported adversely, not on the adjudication of the plans, but on other matters connected with the competition, in our issue of December 9th. Mr. C. E. Fox, the hon. secretary of the Halifax Society, has written a letter to the Governors in which he states: "We feel it necessary to lodge a protest on the ground that the selected design does not comply with the conditions, more particularly as to the accommodation provided for in class rooms. This was stated to be 150, whereas 125 is the number provided for in the successful design. There are other irregularities, but this appears to be the chief. The Governors evidently fail to realise that the fifteen sets of drawings submitted represent weeks of careful thought and work, and an actual cost of from £15 to £20 each set, or we think they would not have arrived at such a hasty conclusion, and thus what the competitors regard as a grave injustice would have been avoided." To this letter Mr. John Reeve, clerk to the Governors, has replied pointing out that the Governors regret that there seems to have been some misapprehension with reference to the accommodation to be provided for the class rooms. The assessor was supplied with the block plan and particulars and conditions supplied to all the competing architects for his inspection prior to the examination of the plans, and the Governors were informed by him that the architects who had submitted designs had complied with all the conditions and regulations sent to the competing architects. Meanwhile, our report is with the Competitions Committee of the Royal Institute.

Middlesbrough Branch Library.



We draw attention to this new competition, and to the satisfactory provision for returning the deposit to architects who decide, after inspecting the conditions not to compete.

Correspondence.

The Proposed Guild of Architects' Assistants.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—With reference to Mr. Dixon's salient article on the above subject, allow me to endorse warmly his remarks. The condition of the architectural assistant of to-day constitutes a real danger to the profession, and the subject cannot receive too much attention. Assistants as a class are, I am afraid, steadily going down, and that means that the whole profession is in danger of also sinking. The assistant of to-day may be the practitioner of to-morrow, and if he is not up to the standard, he will certainly be a source of weakness to the profession. Again, an assistant is not a servant, and principals prefer to have a staff of men with whom out of office hours they could meet on equal terms, and, indeed, in the office also, bar the fact that one is doing work for the other. I mean there should be no other difference, and as the work is paid for, I do not see that this difference amounts to much.

With regard to experience, as far as chief assistants are concerned, they often know as much as their principals. Now this ideal state of fraternity between principals and assistants, both working to one end—viz., the furtherance of art, cannot possibly be maintained on the present salaries and under the conditions which commonly prevail. To work with an architect who is wedded to his profession is by no means servile, any more than it is for art students to study under a master. Unfortunately, to preserve such a high standard amongst assistants is at present impossible, but by the formation of a guild such as has been suggested, a great deal might be done with this object.

Mr. Dixon does not tell us how the Guild would be formed, but I think the time is ripe for going into this question. No doubt there are different ways in which the Guild could be formed, but I am inclined to think that perhaps the simplest way would be to do it through insurance. Signatures of assistants willing to take policies would first have to be obtained to form the Guld. Then the Guild and an insurance society (to be chosen) would enter into a partnership of not less than five years. The insurance society would undertake to issue policies to assistants only through the Guild, and at reduced rates, and the Guild would undertake only to do insurance business through that society. Thus, assistants would receive their policies, and pay their premiums through the Guild in the same way as ordinary policy holders do through insurance agents, and in a similar manner the Guild would receive the commission which would be its source of income. Both assistants and insurance company would reap the benefit of the Guild, and the Guild would be so much stronger for the double support. With regard to insurance, this would include unemployed insurance, life, accident, sickness, and, in fact, every class which assistants would require. Returns would have to be filled in, stating age, experience, testimonials, salary, private means, married or single, etc. Pupils, of course, would not be included. The premiums would be based on the above particulars. With regard to the work of the Guild; this would be directed towards the uplifting and protection of assistants, and would deal with all matters connected with their welfare—salaries, overtime, holidays, employment register, lending library, exchange and mart, home employment, sketching club, etc., etc. Arrangements might even be made, at any rate, in town, for assistants' dining places at special rates. This might be developed into a boarding place as well, and finally into a properly equipped club, and form a rendezvous for provincial assistants when in town.

The Guild then would look after assistants in every way, and those needing help would be kept from going down. The standard of the whole class would be raised, commercialism would gradually have to give way, and architecture take the leading place in the profession.

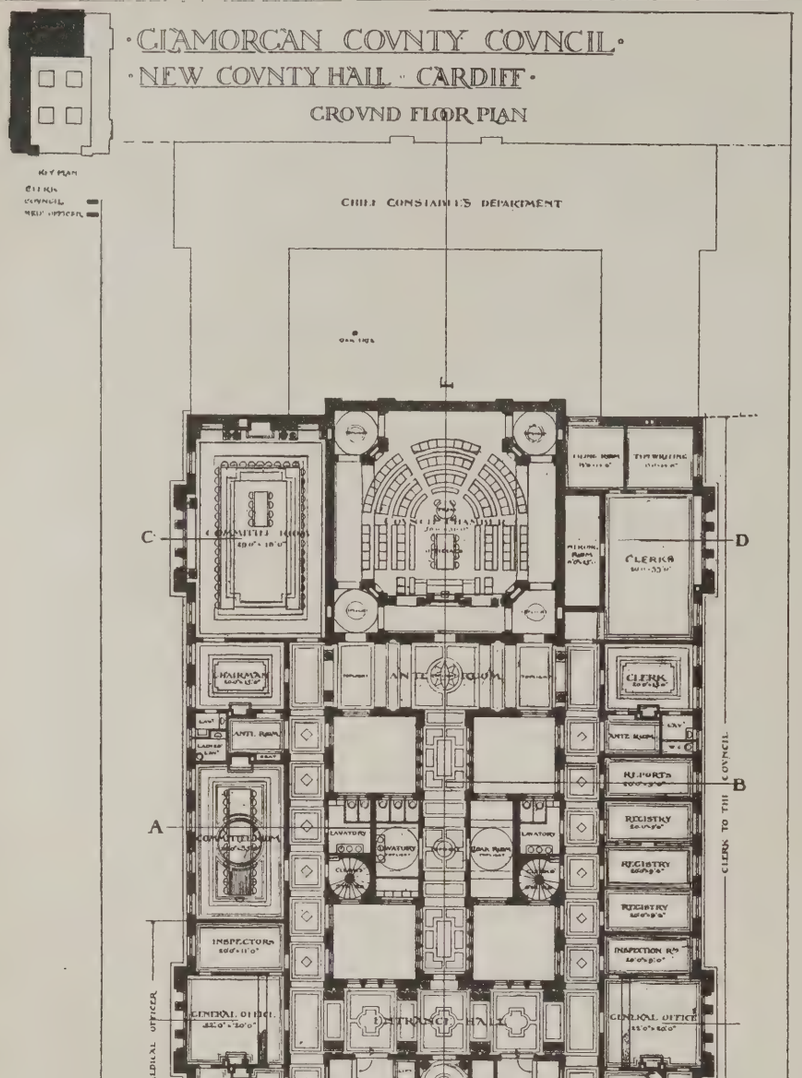
A REGULAR READER.

Bedfordshire.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I would be willing to join the above if a large number of other assistants do likewise. I am a pupil, and expect this Guild will include such. The Guild would have much to do to see that the pupil who pays a premium gets his proper experience, and is treated as a pupil, not as a clerk or office boy. Pupils could agree amongst themselves as to rates for overtime, according to the status of the student.

I don't like the idea of relief to unemployed. No trade union does, and I for one certainly would not join under these conditions. It is generally the fellow's own fault; but assistants leaving their masters on advice of Guild, for incomplete salaries, and other reasons for which the Guild is formed, would be entitled to receive strike pay until he has procured another job. I hope this Guild of Assistants will, when the present generation of assistants set up as architects, form an Architects' Union. This Guild of Architects' Assistants will, of course, as it gets stronger, be stringent in its rules. I mean not like the R.I.B.A., making a scale of fees and not keeping to them, but members breaking rules to be properly boycotted, and union men to refuse to work with non-union men, and also architects who do not comply with the rules of the R.I.B.A. and officials. The Guild could insure members' instruments, etc., from loss by fire and theft. I think that the first 800 members who subscribe should, if the union goes ahead, be exempt from the next year's subscription if possible, as such an inducement will draw I think, a lot of members when a London committee, etc., is called. Branch committees will, of course, be held at Manchester, etc.



I suppose that testimonials, etc., will be forthcoming as to the bona-fides of the Secretary, etc., and I think as architects will try to crush this union, that its resolutions shall be kept secret, and only issued to members.

RICHARD ROSTRON.

Southport.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—We, the undersigned, are desirous of expressing our keen appreciation of the suggested Guild for Architectural Assistants, and we respectfully tender our

THIRD PREMIATED DESIGN. HENRY T. HARE, ARCHITECT.

most sincere thanks to Mr. Dixon for the great interest he has taken in this matter. If architectural assistants, as a body, would only take the same interest as your correspondent, the suggested Guild would shortly become an accomplished fact. If architecture is to be a livin reality and not a ghost of by-gone ages, surely this is one of the best means of raising the standard of architectural work. It is only by the production of work that is sound, thoughtful, and artistic, that architecture can ever gain the attention of the public, and claim the same interest and admiration as music, the drama, and literature.

London, S.E.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reply to the request by "Assistant" (in the issue of THE BUILDERS' JOURNAL for December 9th), with respect to the formation of an "Architects' Assistants' Guild," I shall be very willing to unite in forming such.

W. C. AUTCLIFF.
5, Clonmel Road, Fulham, S.W.

The presentation of prizes to students of the Trades Training School, Great Titchfield Street, which is supported by the City Guilds of Carpenters, Joiners, Painters, Plaisterers, Tylers, and Bricklayers, etc., was made by Sir Guilford Molesworth at Carpenters' Hall, E.C. For the Banister-Fletcher medal for the best craftsmen in the school the competition resulted in a tie between the joiners and the smiths, who each received a medal. This year, for the first time, the Carpenters' Company had held an examination in Manchester.

We regret to notice the death of Mr. Robert Hobart for many years editor of our esteemed comtemporary "The Architect." Mr. Hobart was born in Dublin in 1831.

THE TOWN PLANNING OF THE ROMANS: CONSTANTINOPLE

The Augustæum or forum was the centre of civic life, a huge open space about a thousand feet long by three hundred, broad-paved with marble, adorned with statues, and surrounded by stately buildings. On the eastern side of the Augustæum, adjoining the wall of the emperor's palace, were three large public buildings connected by double colonnades, comprising (1) the magnificent Baths of Zeuxippus, which were constructed after the old Roman manner; (2) the Senate House, said to have been modelled upon that of Rome; and (3) the Bishop's palace, which was known as the *Trioline* on account of its three flights of entrance steps. The great Hippodrome, about 900 ft. long and 450 ft. in breadth, contained thousands of marble seats copied from those of the Temple of Bacchus at Athens, and occupied almost the whole of the western side of the Augustæum. In it was the usual "spina" (or central divisional wall), about 4 ft. in height, round which the chariots ran, extending the entire length of the building and ornamented with three monuments. Although the walls of the Hippodrome have long since disappeared these three memorials of the foundation of the city are still to be seen in the open space (known as the Atmeidan or place of horses), in the Turkish city of to-day. The oldest of the monuments which thus formerly adorned the Hippodrome was an Egyptian obelisk, covered with the usual hieroglyphics. Another, the famous column of the three-headed brazen serpent, was also of considerable antiquity, as it was dedicated at Delphi to Apollo by Pausanius and the victorious Greeks in 479 B.C. after the battle of Platæa. The third monument, a square bronze column, served to mark the goal of the chariot races. Ranged along the eastern wall of the Hippodrome, and thus visible from the Forum, were various temples and groups of statuary, amongst which was a lofty column of porphyry brought from Hierapolis and originally surmounted by a bronze figure of Apollo, which was afterwards transformed into a representation of Constantine. Northward of the Hippodrome, towards the Marmora—situated on rising ground, was a church planned in the form of a Basilica, and dedicated, by the founder of the city, to the Divine Wisdom (Hagia Sophia)—an earlier and much less imposing building than the famous domed structure by which it was eventually replaced. Partly destroyed by fire in the fifth century, and restored and again burnt in the following century, nothing, save the name, now remains of Constantine's building. Other churches, founded by the emperor, and known later as those of the Divine Peace, *Hagia Irene*, and the Holy Resurrection, were, probably, originally copies of well-known temples in Rome, because at the time of their erection it is possible that the vacillating Constantine had not yet finally decided to throw in his lot with his Christian subjects, although two years later, when his new capital was inaugurated, it would appear, from the fact that the ceremonial was performed exclusively by Christian ecclesiastics, that he had then definitely done so. The stately buildings thus briefly described were situated in the heart of the city, the outskirts of which, extending for miles north and west of the Augustæum, were covered with many

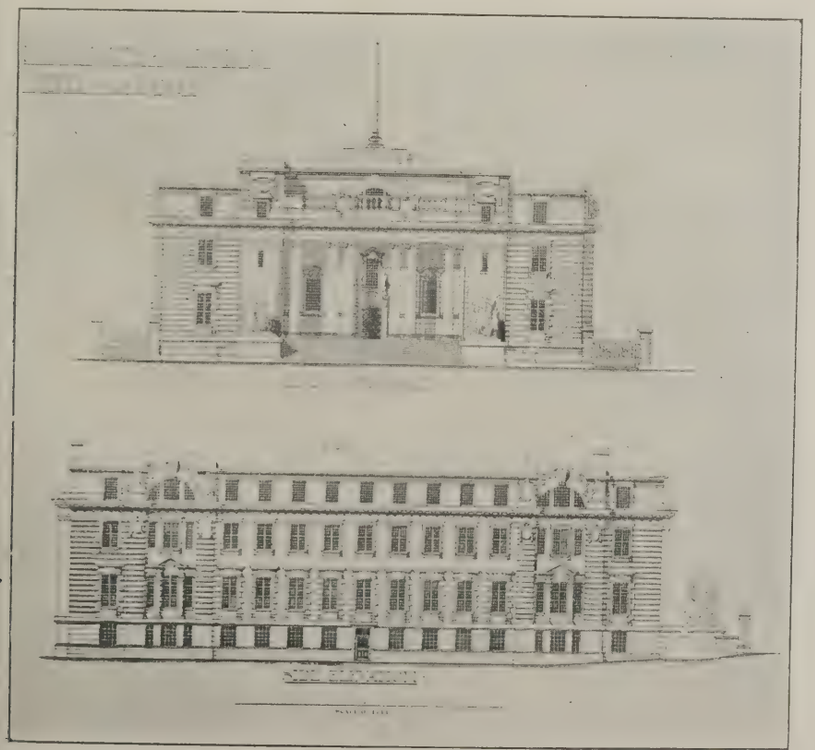
posing character. Public granaries lined the quays, and the Golden Gate, near which was placed an equestrian statue of Constantine, marked the termination of the main road from the west; and this and other chief streets of the Stamboul of to-day follow the lines of Constantine's ancient city. Most of the buildings of Constantinople were of white stone, but everywhere a very general use of marble was noticeable. Contributions, from the whole empire, were levied for the adornment of the capital, and the cities of Greece and Asia Minor, and those of the Islands of the Archipelago, were ransacked to provide statues and other works of art. Encircled by walls of great solidity and strength, and otherwise fortified from attacks either by land or sea, the city might well be deemed almost impregnable, but, to enable it to stand a lengthy siege, underground and other tanks for the storage of immense volumes of water were provided.



Our Plate.

Premises for the Scottish Institution of Engineers and Shipbuilders, Glasgow.

This new building, designed by Messrs. John B. Wilson and Son, of Glasgow, has now been completed. The design was selected in competition, the engineering work, such as the lighting, fitting, heating, and ventilation, being carried out under the direction of special committees of the Institution. On the first floor are a large smoking-room, two meeting rooms, small meeting hall, small Council room, and coffee room with servery. And on the second floor are the large meeting hall illustrated on our centre plate, another meeting room, ante-room, large Council room and cloak room.

Measured Drawings, No. 3, Eagle House, Mitcham, Surrey, continued.

We give a third plate of details of this house, showing the cupola and the console brackets of the hood over the doorway.

GLAMORGAN COUNTY HALL THIRD PREMIATED DESIGN. HENRY T. HARE, ARCHITECT.

THE CONCRETE INSTITUTE.

About a hundred gentlemen attended the second general meeting of the Concrete Institute, held last Thursday at half-past four p.m., in the Theatre of the Royal United Service Institute, Whitehall, London. The chair was taken by Mr. Edwin O. Sachs, F.R.S.Ed., who was supported on the rostrum by Mr. Wm. Dunn, F.R.I.B.A., Mr. Wells, the hon. treasurer, and Mr. H. Kempton Dyson, secretary. Among those present in the body of the theatre were the following:—Professor Beresford Pite, Messrs. R. W. Vawdrey, G. C. Workman, H. K. Bamber, W. G. Perkins, J. Munro, H. B. Gates, Chas. F. Marsh, M.I.C.E., J. Ambrose.

The Hon. Treasurer having read the notice convening the meeting,

The Chairman said he would like to make a pleasant communication. At the last meeting he informed them that the Concrete Institute had just touched 300 members, and they had just touched 400 members that day, an increase of 100 between the two meetings. Continuing, he said: In introducing to you Mr. William Dunn as the reader of to-day's paper on "The Examination of Designs for Reinforced Concrete Work," I would like to say that I consider that the Institute is to be congratulated upon having this particular question dealt with by the chairman of the Institute's Science Standing Committee, who not only ranks as a leading exponent on all questions relating to reinforced concrete, but who has had considerable personal experience in the examination of designs on behalf of a certain Government department. It has been an open secret that Mr. Dunn was one of the primary movers some years back in obtaining for us the Special Committee on Reinforced Concrete, which was formed by the Royal Institute of British Architects, and was so ably presided over by Sir Henry Tanner. Whenever there has been good work to be done, either in the advancement of reinforced concrete or its reasonable control, Mr. Dunn has been to the fore, and only in the past weeks several of us have seen him actively engaged on the question of the regulation of the loan periods as granted by the Local Government Board on reinforced concrete structures, and also on the proposed new enactments for the regulation of buildings in the Metropolis under the London Building Act. There can be no doubt that Mr. Dunn's paper is most apropos at the present juncture, for public authorities of all kinds and descriptions are considering the principles upon which designs for reinforced concrete work are to be examined and controlled. We have such a public authority as H.M. Office of Works, where the Architect-in-Chief naturally desires that the designs of buildings erected under his supervision shall have the extra check of special examination. We have an authority like the Local Government Board, which will, in the future, have to examine designs on reinforced concrete in a systematic manner and on some recognised principle, and will eventually have to lay down a procedure for such examination. We have the London County Council that proposes to have new regulations for reinforced concrete structures, and will have to formulate some rapid and practical system by which, both at its central office and in the offices of the district surveyors, the reinforced concrete schemes can be examined on standard lines. What holds good for London will shortly be applicable to cities like Liverpool and Manchester, and everywhere some effort must be made to systematise the examination of designs for reinforced concrete work. If there is one point I would like to bring out in introducing Mr. Dunn it is that the title of his paper is a precise one. He is not speaking to any considerable extent of the supervision of the work in course of erection, its testing after completion, or the pros. and cons. of individual materials, or systems of design. It is thus also to be hoped that the meeting will, in its discussion, limit its commentaries precisely to those points with which Mr. Dunn is dealing, and not on this occasion deal with the more general aspects of reinforced concrete. This question of the examination of designs is a very important one in itself, and affords ample scope for discussion. I will now call upon Mr. Dunn to read his paper.

The Examination of Designs for Reinforced Concrete Work.

After a few introductory remarks, Mr. Dunn called attention to the fact that for very many years back engineers and architects had been accustomed to use concrete strengthened with steel or iron, but in an elementary way. Thanks to the labours of certain enthusiasts who, foreseeing the great future before reinforced concrete, bit by bit advanced the theory and practice of it to the present scientific adaptations of means to the end which was now common property, we had passed that elementary stage. These enthusiasts, generally speaking, were both designers and executants; were not professional men, but men with fine constructive instincts, whose faith in their own power was attested by their carrying out their own works. As the importance of their undertakings increased, the reinforced concrete firms called in to their aid professional engineers to prepare de-

THIRD PREMIATED DESIGN. HENRY T. HARE ARCHITECT.

signs for the works tendered for, submitting design and tender together in a manner more usual in American than English practice.

Specialists and Systems.

As a result, almost all the work of design as well as construction fell largely into the hands of specialist firms, claiming more or less patent rights either for the whole system of construction or for some special details of it. These claims, while no doubt enlarging the practice of the individual firms, naturally operated in restraining ordinary designers from attempting work in reinforced concrete with a possible legal dispute in the background, and though it is now generally admitted that there are no exclusive rights in the ordinary combinations of steel and concrete, but only in some particular details which Mr. Dunn would not attempt to define, the lecturer stated it was still the rule rather than the exception for those desirous of using reinforced concrete to invite designs and tenders from the specialist firms—the designs, of course, based on general lines—instead of, as usual in other branches of work, employing an engineer or architect to prepare the designs and conditions, and soliciting tenders thereon. There was a great deal to be said in favour of this arrangement. It was reasonable to suppose that those who spent their whole lives in one class of work understood it better than those whose energies were distributed over several classes, and that efficiency and economy were both served.

Competitive Designs.

If the work in question was tendered for by one firm only, the owners were largely in the hands of that firm as to price, and, though the lecturer disclaimed the slightest reflection on the contractor, it was but natural that he should prefer there should be no other tenderer for the same reason that the owner objects to it, namely, that the one was likely to pay and the other to receive a much better price. If, however, several firms were invited to tender, the designs submitted varied in regard to the method of construction, the reserve of strength, etc., and a fair competition and just choice between them became difficult. How were they, he asked, to decide if these designs were properly conceived, might safely be erected, and complied with the requirements laid down? Whatever the structure might be, the general lines of it were no doubt determined by those inviting tenders, and the questions to be considered were primarily questions of strength and durability.

Rules and Methods of Calculation.

Fortunately, we had now an authoritative pronouncement on the general methods of calculation to be adopted. Empirical and semi-empirical rules were no longer recognised, since we had for our guidance rules based on scientific reasoning, and giving results closely confirmed by experiment.

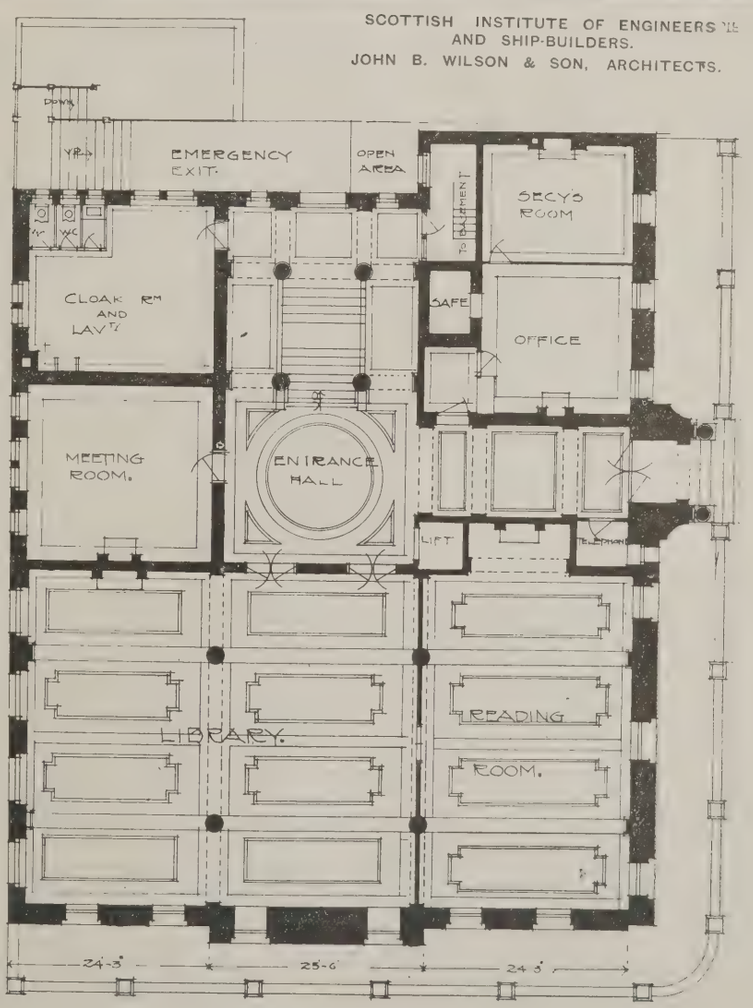
Mr. Dunn thought the rules laid down by the Royal Institute of British Architects' Committee on Reinforced Concrete undoubtedly formed a standard from which we ought not to depart without good reason.

Debatable Points.

In going through a set of drawings there were always debatable points calling for the exercise of judgment, cases in which we could not say definitely how the loads were borne. In these, Mr. Dunn stated, he would always discuss the matter with the designer, and give his views full weight before forming his own opinion. We could not, of course, agree that any patent system abrogated the ordinary laws of mechanics, and must take care that when they had to make assumptions as to the lines of action of loads or stresses, those assumptions were on the side of safety and logically followed out. There were always differences in design for which we might have a legitimate preference; one design differing from another in being much more scientific in conception or neater in detail according to the skill of its author. But we must be careful to keep our preferences from becoming prejudices. The position of the consulting engineer who had to examine and report or decide on competitive designs and estimates was one demanding considerable tact and commonsense as well as professional qualifications. It should be considered how those designs had been prepared; made not for actual work in hand, but only for possible work, with insufficient data and necessarily very brief study of the project, it was often a matter of wonder to the lecturer how such good designs were produced under the conditions.

Drawings Submitted with Tenders.

The drawings submitted with tenders were generally meagre, and the serious difficulties of the undertaking commonly left for future consideration. Out of these projects, that of the lowest tenderer was selected for consideration, and the architect or engineer must satisfy himself as to the practicability of the design and as to its compliance with the conditions laid



down before recommending it for acceptance. If he had not sufficient experience of this class of work, he might call in a consulting engineer who had made it a special study. Was the engineer to require all the drawings, details, and calculations necessary for him to form an opinion on every point on recommending a tender for acceptance? Mr. Dunn asked. That would entail a very large amount of labour on the part of the contractor, which might be all thrown away. But unless the engineer had had these full details before him, unless he had carefully recalculated nearly every structural part to justify a particular instead of a general approval, there was room for serious dispute. Though the responsibility for the strength of the work was in every contract expressly put on the contractor, the engineer had a large moral responsibility that his opinion should be so carefully based on actual investigation as to be of genuine value. He had heard many complaints from reinforced concrete firms of the unnecessary loss entailed on them by calling for detailed drawings to accompany tenders when the latter were asked for any particular piece of work. Of course, the contractor must usually prepare some rough drawings before tendering, but the expense of making fair copies was very considerable, and it might be possible to reduce this by asking only outline drawings, reserving the right to require details before acceptance of tender. The cost of the drawings was a large part of the expense in reinforced concrete, and when contractors have to charge the cost of the preparation of many unsuccessful schemes on a few which are successful, the work is seriously handicapped. The reinforced firms could do something to economise labour if they required the necessary outlines to be supplied and did not supply details until after the receipt of the tenders, when the lowest tenderers, or the favoured tenderers, could submit the full scheme for consideration of the consulting engineer. If in the specification upon which tenders were invited the contractors were distinctly informed that the work was to be in accordance with the recommendation of the British Committee's Report, the stresses to be restricted to those given therein, and the drawings and calculations to be submitted to an expert for verification, the contractors would have no reason to complain if a design were found not to comply with the conditions. What they did complain of was that the competition system virtually tempts them to cut down the works to the lowest limit, and unless some proper examinaion was made the man who had honestly complied with the requirements might be at a serious disadvantage. If all the requirements were clear at the start they all worked on a fair basis.

Points to be Observed in Checking Calculations.

In checking calculations the dead weight of the structure was a more important element than in other constructions, and should be carefully computed, not guessed at, and allowed for as part of the loading. The lecturer had sometimes found serious deficiencies in strength due to this want of precaution. The amount allowed as a negative moment for fixing at the end of beams should be carefully considered. Mr. Dunn said he had had end fixing claimed for beams freely supported, but all such errors were so capable of demonstration that disputes could be avoided. We should remember always that all our results depend on our as-

sumptions, as a syllogism depends on the premises. If these were wrong, correct reaoning on defective premises was a positive danger.

Superintendence.

Suppose, however, that the design had been carefully checked, initial difficulties got over, and the work begun, the superintendence of the work was merely the transference of their anxieties into another field. He was very strongly of the opinion that no work of importance should be entrusted to men without experience; our best safeguard against defective work was undoubtedly the skill, experience, and honesty of the contractor. No engineer or architect, unless he spends all his time during the execution of the work in actual and constant supervision, can secure his employer against dangerous errors on the part of the workman. In steel construction we can examine and measure every part after it is up; not so in reinforced concrete work. Once the concrete is laid we cannot tell but by cutting into it whether there are six 1in. rods or two 3in. rods inside a beam or pillar, or whether these are 2in. or 4 from the surface. To see that the drawings are actually carried out requires a conscientious scrutiny and attention every minute of the time the work is being done.

Failures.

Notwithstanding all our care and forethought, we had sometimes trouble arising from obscure causes. All work in reinforced concrete was looked on with jealous eyes by those who were not in favour of it. Every failure was magnified, every little accident was blazoned forth in the most vivid colours, not given to such great disasters in other systems of construction as the Quebec Bridge. We should be doubly careful, in that these troubles involved the whole industry as well as ourselves, and though we might chafe at the injustice of our critics we might profit by the severity with which our mistakes were visited. When failures did occur let us do our best to discover the true cause, sparing no effort to do so.

(To be concluded.)

Law Cases.

Architects Recover Fees.

At Walsall County Court, before Judge Smith and a special jury, an action was brought in which Messrs. Heckton and Farmer, architects, of Walsall, sought to recover £83 5s. from Mary Ann Fox, of the Gridge Inn, Park Brook, Walsall, for preparing plans for the erection of eleven cottages and a shop.—It was stated that a brother of the defendant approached the plaintiffs with respect to preparing these plans for the defendant. Various plans and specifications were got out, and tenders invited, but it was stated that the tenders were rejected and the plaintiffs were told to send in their bill. A dispute arose as to the amount which was charged, and plaintiffs allege that afterwards they found that the building was being put up practically according to the plans they had prepared.—The defence was that the plaintiffs agreed to do the work for one and a quarter per cent., and the defendant offered the amount represented by this, namely, £32 10s., in settlement of the claim.—The jury gave the plaintiffs a verdict for £50 and costs for the work they had done.

Between Two Plans.

A charge of building without proper authority was preferred at Doncaster Borough Court, when John Henry Scales was summoned for breach of the by-laws relating to new streets and buildings.—It appeared that defendant submitted a plan which was not approved, and then he handed in a plan which was passed, but he began to build contrary to both plans. The alterations were in connection with a cottage adjoining defendant's own dwelling, and he had raised the roof higher than shown in the plan, and converted an open shed into a portion of a dwelling-house. Defendant had written to the Sanitary Committee admitting his offence, but sincerely hoping that he might not be regarded as a wilful law breaker.—He was fined 20s. and costs.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Correction.

Our attention has been drawn to some literal errors in the reply to Retlaw, published in our issue of November 25th. On p. 416, col. 1, line 14 should read "a vector line," etc.; the equation below (line 24, col. 1) should be $2P_1 = \frac{2P \times DE}{CE}$; and (line 34, col. 1) should read "value of the B.M. is $Q \times X$."

Hard Water.

YORKS.—KEIGHLEY writes: "A client of mine has been troubled with the galvanized iron hot-water cistern of his house rusting. To prevent the rust getting worse, he emptied the cistern and covered the inside of it with a wash of Portland cement and water. This seems to be having the desired effect, but unfortunately it is making the water so hard as to be almost impossible to get a lather when washing with it. Can you explain the cause of this hardiness, as our water supply is particularly soft, coming off peat, and can you also suggest a remedy?"

The cause of the hardness is the cement (which is limestone ground to a powder ere being slaked), and the unsually soft peat water. The cause of the rusting is the cracking and chipping off of the galvanising during the fixing of the cistern and connecting of the pipes. It is practically impossible to prevent the cracking and chipping. You do not say whether the boiler is iron or copper; if the latter, an electrical action has been going on, no doubt, due to the peat water and the zinc of the galvanizing and the copper of the boiler, depositing the zinc on the copper. The remedy is a copper cistern of the usual cylindrical form; or, if this be not suitable to the space, a sheet iron cistern, of twelve or fourteen gauge, copper-plated. Care must be taken to not crack the copper plating when the pipes are being coupled up. INGENIOR.

Water Pipes.

WILTS.—R. AND S. write: "We are anxious to obtain some cast-iron water pipes, 1½ins. or 2ins., that will not be affected by mineral acids, etc., in clay, through which they are laid. Dr. Angus Smith's coated pipes are not proof against this action of the soil. Are there any other methods of coating iron pipes for underground supplies, that will efficiently protect them against such action in the soil?"

The only method which can be adopted is either to have glass-coated pipes, or to paint the pipes with a non-corrosive paint, of which there are several known on the market, but a well-known paint is made by Messrs. D. Anderson and Son, Roach End Works, Old Ford, E., and is called "Siderosten." ASSOC. M.I.C.E.

Payment of Fees.

WESTCLIFF-ON-SEA.—C. writes: "A (the architect) has experienced difficulty in

obtaining payment from B (the employer), for whom he has superintended the erection of houses under contract. The contractor's final certificate is due at Christmas, which is six months after completion and occupation of the houses. Can A, in issuing the final certificate to contractor, include in same his fees, if so stated? and must B pay same to the contractor who will remit to A?"

No; the architect cannot include his fees in the amount payable by the building owner to the contractor, and obtain same from the contractor afterwards. His account must be rendered to the owner, and if the latter will not pay up, the architect must take the usual legal proceedings. Until the architect has issued the final certificate, however, he has not completed the work, and it may be for this reason that the client is withholding his fees.

MONMOUTH.—A. B. writes: "We have commenced building operations as shown in sketch herewith [not reproduced], and the owner of property "B" writes as follows:—'I herewith inform you that your building in front of my property will seriously diminish its value and block up my right of light. You are probably not aware that my property having been erected in 1881, a right of light has been acquired, and unless you at once stop your building operations and pull down the work I shall commence proceedings against you for an injunction and damages without further notice.' As the sketch shows, we have observed the rule as far as we understand it, and any line drawn at an angle of 45 deg. from "B's" light is not obstructed by our building. Please advise us if this is in accordance with the by-law."

The question of damages for interference with right of light rests solely, since the decision given in the case of Colls v. Home and Colonial Stores, Ltd., on the amount of the diminution in the light preventing the proper use of the buildings. At one time all these actions were decided by the question of angles by which the light entered the particular building, and which had been altered by the erection of the building complained of, but since the decision referred to, the whole matter turns on the question of fact, whether the plaintiffs have lost proper enjoyment of light in their building. We need hardly say that the establishment of this fact is productive of very costly and wearisome litigation. We can only suggest that you consult your solicitors in the matter, and they will be able to inform you of the possible chances of your convincing a jury that your building had not injured the light in the plaintiff's premises at all, or sufficiently seriously to prevent their proper use and enjoyment of those premises.

Water Consumers' Rights.

WINGATE.—DUBITO writes: "A private water company has in its rules the following clause:—'The Company will lay and keep in repair such portions of all service pipes as may be necessary upon any highway or public thoroughfare outside only of the boundary of the property to be supplied, providing the distance does not exceed 25ft.; all other piping and interior fittings to be at the consumer's expense.' To supply a new street in the expanding township, a 2in. supply pipe or by-main is laid by the Company up the back street for about 500 yards from the large main in the high road. The house supplies are taken from this by-main. (1) Can the Company demand payment for this 2in by-main from the householders to whom the cost is being assessed? (2) In the event of the householders paying for it, does it remain the property of, and is it repairable by the Company? (3) In the event of refusal of payment can the Company (which has powers in the district) cut off the supply?"

A private water company, possessing no Parliamentary powers, must make its contracts and carry out its obligations in exactly the same way as does an ordinary individual; and the answer to all these questions then depends entirely on the single point—"Is there any contract expressed or implied between the water Company and the person proposed to be charged?" I should suppose there must be a contract with someone with regard to the insertion of the 2in. main in the back street—the company would be hardly likely to trespass on a private owner's property, or to lay a main without being previously asked to do so! I am of opinion, therefore, that (1) the water company can only demand payment for the main from the person or persons who arranged for its construction. (2) The main would still continue to be the property of the company and form part of their system—it would be repairable by them. (3) I believe the company could cut off the supply unless indeed they had made a bargain with the householders that they would supply water, and yet had omitted to include the payment for the main in that bargain!

F.S.I.

Boundary Wall Problem.

KIRKCALDY.—D. F. S. writes: "A and B have a boundary wall of various heights between their respective gardens, the centre line of which is the boundary between the two properties. A built the wall at his own expense, and his conveyance, like that of B, states that A is to recover half the cost or expense of erecting the said wall to a height of 7ft. from B. The conveyance does not state whether the 7ft. is from the surface of the ground or from the bottom of the foundation, and B refuses to pay for more than 7ft. in height of wall in whatever way it is measured, while A expects to be paid for 7ft. above the ground, and the foundation and digging in addition. What would be considered a reasonable view to take of this case? And what is usually meant by the height of a wall when no further definition is given?'

The height of such a wall is naturally reckoned from the ground line, and the respective purchasers must carry out their covenant with the original freeholder by building a wall measuring 7ft. from the natural ground line to the top of the coping. To build such a wall in a workmanlike and proper way, good footings are necessary, and the work would not be properly carried out if they were omitted. It therefore follows that each owner must pay for half the wall and footings and coping complete.

F.S.I.

SOCIETIES' REPORTS.

R.I.B.A.

At the meeting at 9, Conduit Street, Hanover Square, W., on December 14th, Mr. Alexander Graham, hon. sec., announced with regret the decease of Mr. John Peter, who was elected an Associate in 1888.

Mr. R. Anning Bell, in proposing a vote of thanks to Mr. Spence for his paper on "Interior Decoration," of which an abstract appeared in our issue for December 16th, commented upon the difference of opinion among architects as to what constituted "scale." He thought that personal predilection should be eliminated, and the question fought out, in order to establish a recognised basis upon which to work.

Mr. Reginald Blomfield, A.R.A., in seconding the vote of thanks, recorded his confidence in white paint as an admirable background for the accentuation of practically anything that could be put upon it. Referring to Homer's description of the Palace of Alcinoüs in the Odyssey (to which Mr. Spence had alluded), Mr. Blomfield expressed great doubt as to the advisability of placing reliance in poetical or literary descriptions of sculpture, painting, or architecture. With regard to the question of scale raised by Mr. Bell, he had arrived at the conclusion that there was no ideal scale from which to design.

In the ensuing discussion, Mr. George Herbert, Prof. Gerald Moira, and Mr. John D. Grace, were the speakers. The last-named gentleman entirely disagreed with the general adulation of white paint, and attributed its popularity to the fact of its being the last refuge of the destitute. Mr. Spence briefly replied.

Birmingham Clerks of Works Association

The members of the Birmingham Clerks of Works Association have visited the large warehouse and retail shops of Messrs. Lewis, in Corporation Street, to inspect the alterations there in progress. These alterations, which are unusually interesting from the risks and difficulties that have had to be overcome, have been carried out by Messrs. Tomkinson and Son, of Liverpool, under the instructions and from plans prepared by Messrs. Wood and Kendrick, of Birmingham and West Bromwich, with the assistance of Mr. Farrer, of Liverpool, as expert in steel construction.

When it is recalled that this building, which is about 90ft. high, and has a frontage of about 300ft., occupies the site of the burial-ground of the ancient Priory of Birmingham, and that the foundations were laid in what is practically running sand, an idea will be formed of the risks run, and the care required in overcoming them during the decidedly delicate operation of taking away all the brick pillars—eleven in number, each carrying an average weight of 240 tons—and substituting rolled steel columns. The object was to obtain more window space and floor area; and as the brick pillars, which were 4ft. square, have been superseded by steel columns 9ins. in diameter, the result is a gain of 200 superficial feet of additional window area for the display of goods. The old window frontage was about 210ft. in length, whilst the new front gives 250ft., together with an additional entrance. This is the largest shop-front alteration ever attempted in the Midlands. The work, which has been carried on continuously day and night for several months without interference with Messrs. Lewis' business, was done so accurately that when the last supports were removed, and the new columns received the weight of the building, not the slightest crack could anywhere be perceived, nor did any mishap occur. The party were conducted over the works by Mr. W. H. Kendrick, the architect in charge, who was accompanied by his chief draughtsman, by the contractor and his foremen, and by Mr. Jas. Patchett, the

inspector for the city authorities. At the conclusion of the inspection, hearty votes of thanks were offered to these gentlemen.

Leeds and Yorkshire Architectural Society

At the rooms of the Leeds and Yorkshire Society, Mr. S. D. Adshead, in the course of a paper on "Style in Architecture," adopted the definition of the word "style" in architecture as implying a particular type of character which by repeated usage has developed into set form. Character is closely allied to style, but denotes something more personal and fleeting. Style is an advanced state of character; it is character systematised by consistent and persistent effort. In fact, it is crystallised character. Every style of architecture, when analytically examined, is found either to have developed out of other styles by the adaptation and infusion of certain of their characteristics, or it is found to be a direct transcription of some one other style. In the former case it tends to be original, and in the latter case it is affected. English architecture must depend for its success in the future upon a more scientific application of knowledge. What we must seek to cultivate is a universal original style, and it is towards the establishment of this that our first interest should be directed. It will be a style founded on system, scholarly intuition, and classic inspiration, and will be easily recognised as *a priori* the style of the nation. At the present day in England we have co-existing many original styles in architecture. Mr. Adshead, while describing them as styles, thought it doubtful whether they are sufficiently systematised to be regarded as anything more than phases of character. In his enumeration of the styles of England existing at the present day, he wished it to be understood that his remarks referred in particular to style as seen in works of a monumental order, and did not refer so strictly to our domestic work of the simpler class. When evolving serious design we should draw our inspirations from a pure classical source, and from that source alone. Working thus, we are working in the grand manner. In England we have what is popularly known as twentieth century Renaissance or Free Classic. When analysed, this so-called style is really found to consist of nothing more substantial than a confusion of forms. Another conspicuous style is twentieth century Gothic. The Gothic churches of Sir Charles Nicholson, Messrs. Bodley, Stokes, Tapper, and Scott, are on the whole amongst the most satisfactory pieces of modern architecture which we possess. Then there is that very conspicuous style which, if not exactly the same as *l'art nouveau*, closely approaches it, and is, in fact, *l'art nouveau* of Otto Wagner, of Vienna. It is to be regretted that this caprice should have captivated the attention of more than one distinguished architect. If modern architecture is to develop a style, it must be the outcome of a sound æsthetic sense, wide research, and scholarly attainment. It must be scientific, and the work of the philosopher as well as the artist.

The work submitted by the students of the Leeds and Yorkshire Architectural Society under the prize scheme of the Society has been placed on view in the Central Court of the Leeds City Art Gallery. The exhibition was arranged on the suggestion of the president (Mr. Percy Robinson), who considered that in view of the excellence of the work it ought to be exhibited to the public. The successful competitors were Messrs. J. H. Farrer and G. H. Foggitt in the class for designs, and Mr. P. de Jong in the section for construction. Mr. Whitehead ("Roamer") won the prize offered by the sketching club of the Society, Mr. Foggitt obtaining second place. The prize for measured drawings was carried off by Mr. W. F. Dawson.

Bristol Society of Architects.

At a sessional meeting of the Bristol Society of Architects held at the Fine Arts Academy, a paper was read by Dr. A. H. Harvey on "The Mediæval Architecture of Northern Spain."

Mr. Mowbray A. Green, the president, said that the subject had for them a very great interest, because of the extraordinary influences which came to Spain from many quarters through many centuries, and it certainly was a peculiarity that so many types of architecture were seen in Spain at different periods.

Dr. Harvey, at the outset, stated his paper was the outcome of two holiday journeys to Northern Spain, one last year and the other some twenty years before. They covered the same ground as that treated in Mr. Street's great work, but he had been enabled to visit places omitted by Mr. Street, all of which were of first-rate importance in the history of architecture in Spain. Another thing was that photography as a means of representation was unknown in Mr. Street's day, so that he was enabled to illustrate many fine buildings that Mr. Street had to omit. What he said he wished to be regarded as supplemental to Mr. Street's work, which had now become so rare that he had not been able to find a copy in Bristol. He was sorry that he had nothing to say upon the earlier architecture or upon the very charming and beautiful renaissance in Spain. One thing that struck him in going through Spain was that the genius of the Spanish people seemed so much akin to that of England. The resemblance was far more so than between other Western races, and this was reflected in their buildings. In church architecture there seemed to be the same exclusive feeling in their worship, and England and Spain were apparently the only two countries where they got the fine enclosed choirs and noble canopy. Spanish cathedrals were, without exception, secular, with nothing analogous to their own monastic arrangements. In the parish churches there were no seats, worshipers either having to stand or kneel. The lecture was illustrated with a number of beautiful lantern slides.

WINNING DESIGN FOR THE BUILDING EXHIBITION POSTER. BY GEO. P. DENHAM.]

ADVICE TO PATENTEES.

The recent letter (see issue of December 9th) of advice to patentees deals with incidents which are unfortunately only too common. Reputable firms of patent agents do not generally negotiate the sale of patents, but at intervals there appears in either the technical or general Press a letter of bitter complaint from a victim of the practice referred to. In every instance the same bait has been used—the client abroad who will acquire the rights at a high figure if the inventor will take out patents in certain foreign countries. The communication closes sometimes with a bald offer to undertake the work, or there may be a professed indifference to the matter. A letter of this type is before the writer now, and it seems a little strange that anyone should treat it seriously, as it is obviously a stock letter written by an office clerk. However, there is no doubt that the method meets with success, and the offer is often accepted. Patents abroad are taken out and expenditure is incurred, but when the limits of the inventor's patience or purse are reached it is generally found impossible to conclude the negotiations with the foreigner. It is much to be regretted that the proper authorities have not yet been willing, or are not in a position to entirely stop, these operations, which must operate to the detriment of a leading profession, for the mass of the general public can hardly be expected to distinguish between a chartered patent agent and any individual who pleases to advertise himself as a patent expert.

The specifications published by the Patent Office are evidence that the practice is not confined to this country. Every week may be found applications from persons abroad for patents concerning devices which are commercially impossible. The failings of the applicants are often proof that they know very little about the practical use of the device they are patenting.

Although only a few patents possess any real commercial value compared with the vast number granted, the possession of a new idea seems to excite intense suspicion in most inventors, and as commercial ability is not generally fully developed with inventive genius, they often fall into the clutches of the unscrupulous. As soon as the provisional application is accepted by the Patent Office, no time should be lost in submitting the idea to reliable firms who may be interested in the matter. Of course, their judgments may be biased for many reasons, but they are not at all likely to pass by a good thing, and the inventor will be well advised, in the majority of cases, if he relies on their verdict, and spends no more money in fees if it is pointed out to him that there can be no commercial success for that particular invention.

The courteous and obliging officials of the Patent Office lead one to overlook the fact that it is merely a part of the huge news-gathering machine controlled from Somerset House, and although a large flow of applications may be regarded favourably as a means of revenue, those who have occasion to search the records and specifications may, with very little imagination, read hundreds of fallen hopes between the lines. Much of this disappointment and expense, incurred by persons who can ill afford it, might be avoided if the applicants had conferred with suitable persons in the early stages before proceeding to pay further fees and instruct expensive models.

THE ARCHITECTS' TECHNICAL BUREAU.

The following should be added to the subjects passed by the Architects' Technical Bureau, as mentioned in our issue for December 9th, on p. 458.

"Durabar" Combined Draught Excluder and Weather Bar.

Makers: Messrs. The Draught, Dust, and Weather Excluder Co., 10, Palace Chambers, Hereford. This is a self-acting appliance for stopping the clearance space which must always be allowed for beneath doors and casement windows. The mere act of shutting the door brings the Durabar into action, and completely closes the space beneath. Immediately the door is unlatched, the "Durabar" automatically and silently flies up clear of the floor or carpet, until the door is shut again. It is a high-class artistic fitting, practically invisible when fitted, and there are no springs, hinges, or wearing parts whatever to get out of order. It can be supplied in any wood desired.

Trade and Craft.

"Inside Facts about Saxon Portland Cement" are detailed in a most neat booklet that has just been issued by the Saxon Portland Cement Company, Ltd., of Cambridge. The quarries whence the raw material is obtained are described, and the processes of manufacture are detailed step by step. The up-to-date works at which the cement is manufactured are illustrated in a series of photo-process views, and several important contracts in which the firm's cement is being used are shown, such as Chippenham Sewage Disposal Works, Northfield Reservoirs, Birmingham and Scunthorpe Waterworks. Analyses, various systems of testing, experts' reports on the product, and a useful series of "Dont's" for cement users, are included in this bright and interesting booklet.

* * *

We understand Eubeolith patent flooring has recently been laid to the extent of about 1,000 yards on old wooden floors at the Geological Museum, Jermyn Street, for H.M. Office of Works. The same company have done practically the whole of the flooring at the new St. Mary's Hospital, Manchester, and also that which has been adopted in the extension to the Salford Royal Hospital, Manchester, and in other important contracts. The whole of this work has been carried out by Mr. J. Percy Day, of 3, Victoria Street, Westminster.

Federation News.

HALIFAX ASSOCIATION.

Secretary: A. E. Dalzell.

At the meeting of the Halifax Association on December 3rd, at the Builders' Exchange, Mr. Lewis Firth in the chair, the secretary read a letter dated Dec. 2, 1908, from the Halifax Architectural Society in reply to the Association's invitation for them to adopt either the Federation or some other agreed form of contract. In the reply it was stated that (a) If contractors when sending in tenders could enclose stamped postcard, the architects would see that the desired information was filled in and posted, that (b) The National form of contract, as drawn up by the R.I.B.A., was not suitable for Halifax, and was too cumbersome for ordinary use, and for such small contracts as are usual in Halifax. "It was devised for one contract, whereas in Halifax all trades are separate. The Halifax Society recognise that some regular standard form of contract for the district is advisable, and they are proceeding to draw up a form of contract and conditions which shall serve as a standard, and when completed will submit same to the association for approval. (c) As to final certificates; the letter continued, generally speaking it was not to the architect's interest to keep them back, particularly final ones, as the architects are usually as anxious to be paid as is the contractor. Mr. Naylor proposed and Mr. G. Raynor seconded that the Association tender their thanks to the Halifax Architectural Society for their proposition, which should be approved and copies of their letter and this association's reply should be forwarded to the Federation. This was carried unanimously.

The delegates appointed to attend the Federation meeting at Barnsley on November 19th presented their report, and drew attention to several matters of detail.

Messrs. Lewis Firth and J. H. Ackroyd were appointed to audit the accounts and report at the next meeting, on the proposal of Mr. Naylor, seconded by Mr. H. Greenwood.

The secretary was requested to invite members of other Federations to consider the advisability of securing the full benefits of the Yorkshire, and thus the National Federation, by contributing the levy of 1s. per £100 of wages paid by them.

Mr. Lewis Firth was re-elected president for the ensuing year, Mr. Joshua Robinson senior vice-president; Mr. Isaac Firth was re-appointed treasurer, Mr. Dalzell secretary.

Mr. Lewis Firth moved, and Mr. H. Naylor seconded, that the association meet monthly, except in May, June, August and September (except in case of emergency), on the first Thursday in the month, at the Halifax Building Trades Exchange, at 8 p.m., and that the secretary give four clear days' notice of such meetings to each member. This was carried.

The following new members were elected:—Messrs. Joseph Bancroft and Sons, slaters and plasterers, Winding Road, Halifax, and Mr. John Herbert. Seven new associated members were also elected.

TEESSIDE AND DISTRICT ASSOCIATION.

Secretary: W. B. Creasor.

The annual meeting of the Teesside and District Association was held on December 9th, at the Grand Hotel, Middlesbrough, Mr. P. Bray, president, in the chair. In order that the proceedings may be the better understood, a brief summary of former meetings is necessary.

At a meeting of the executive committee held at Stockton-on-Tees on November 12th, Mr. P. Bray presiding, the secretary reported that, at the request of the sub-contractor, the local association had been discussing the question of payments on contracts to sub-contractors, and that the question had been referred to Teesside Association by the Stockton and Middlesbrough Associations. After a long discussion, it was resolved that a sub-committee be formed to draw up a scheme dealing with this question, and that the sub-committee consist of one sub-contractor and one general contractor from each local association, with the president as chairman, and that Mr. W. H. Hope, of Sunderland, be requested to attend to give legal assistance to the committee.

At a meeting of the sub-committee held on November 17th at Stockton, the president (Mr. P. Bray) stated that the object of the meeting was to endeavour to formulate a scheme regulating payments to sub-contractors. It was agreed, at the outset, that this meeting fully sympathised with the sub-contractors in their desire to receive better treatment than had been given them by some contractors in the past, and it was fully agreed that some re-arrangement was necessary to enable sub-contractors to receive their just demands. A long and animated discussion took place, Mr. Hope showing that several schemes mentioned could not legally be enforced. The following resolutions were then unanimously carried for submission to the executive committee:—"That the architects be asked to issue a statement with their certificate showing the amount certified under the various trade headings, for the information of the sub-contractor, so far only as his own particular trade is concerned; and that the architects be asked to reply to any enquiry of the sub-contractors on such a matter.

"That an appropriate form of sub-contract be adopted for the use of members, and that the same be submitted in due course for approval, and that the Northern Counties Federation be requested to take this resolution into their immediate consideration."

At a meeting of the executive committee held on November 20th, Mr. P. Bray presiding, the secretary read the minutes of the previous executive committee and the report of the sub-committee, and, after a keen discussion, it was resolved:—"That the resolutions contained in report be sent to each local association for consideration and report to the annual meeting, and that the secretary bring the subject to the notice of the Federation executive committee at their (next) meeting and forward No. 2 resolution for their consideration."

At the annual meeting, which, as stated above, was held on December 9th at the Grand Hotel, Middlesbrough, Mr. P. Bray, president, occupied the chair, and there was a large attendance of members. The secretary, in presenting his twelfth annual report, stated that, in view of the special business on the agenda, he had cut down the report as much as possible. The report deplored the present condition of trade, and stated that as in this district hundreds of houses are empty, there is no inducement to build. It was stated that attendance at committee meetings had been very good, and that close attention had been given to such matters as the Miners' Eight Hours Bill, in which objection was made on the ground that legislative interference with adult labour is undesirable; to the draft report on building accidents,

in which, the committee felt, some of the proposed regulations were too drastic, or were impracticable, and they therefore urged the Home Secretary to give special consideration to the very practical report of Mr. Macfarlane; to the question of a reduction of wages, which, but of consideration for the operatives, was allowed to drop; to the adoption of the BUILDERS' JOURNAL as the official organ of the National Federation; to the negotiations with the Durham County Council Education Committee respecting the building agreement; and the regulation of payments to sub-contractors. The secretary also presented the balance sheet, which showed a good balance in hand, and was accepted as being very satisfactory.

The election of officers resulted as follows:—President, Mr. J. Proud, West Hartlepool; senior vice-president, Councillor Alcock, Thornaby; junior vice-president, Mr. H. McNaughton, Middlesbrough; auditors, Mr. R. Johnson, Stockton, Mr. P. Bray, Middlesbrough; secretary and treasurer, Mr. W. C. Creasor, Stockton-on-Tees. The officers of the past year were thanked for their services, and Mr. Bray suitably replied.

It was decided that the levy should be 1s. per cent. on wages paid, plus the amount required by the Northern Counties Federation; that the executive committee meetings should be held at Stockton, and the next annual meeting and dinner at West Hartlepool.

It was resolved, on the proposition of Middlesbrough Association, that the constitution of the executive committee should be altered, and that each association be entitled to one representative for every ten members or part of ten over five.

The meeting then proceeded to discuss the report of the sub-committee and executive committee on the question of payments to sub-contractors. The discussion was long and very animated, the ultimate result being that No. 1 resolution passed by the executive committee was accepted with the addition of words to the effect that architects be asked to notify also each sub-contractor direct when a certificate is issued to the general contractor and the amount included for his particular trade.

On the consideration of resolution No. 2, the secretary submitted two agreements, one drawn up by Mr. Hope, of Sunderland, the other being in use locally. Both were freely criticised, and ultimately the whole matter was referred back to a sub-committee for further consideration, Mr. Hope to be asked to attend again to give legal assistance.

After the meeting, the twelfth annual dinner was held, 77 members and friends being present. In accordance with custom, the newly elected president commenced his duties by presiding over this gathering.

Sheffield.—It has been already recorded, in the Federation reports, that considerable correspondence has taken place between the Sheffield Town Clerk and the secretary of the Amalgamated Society of Carpenters and Joiners, the Sheffield Master Builders' Association, and Messrs. H. Boot and Son, the contractors for the extensions at the Lodge Moor Hospital, concerning an alleged breach by the latter of the fair wages and conditions of labour clause in their contract with the Corporation for such extensions. In a letter to the Town Clerk, the secretary of the Sheffield Master Builders' Association states: "Mr. Boot will probably be prepared to admit that, according to the interpretations put upon the spirit of the reading of the fair contracts clause, he has transgressed the rules in not paying walking time, though he has always understood, and it is not denied, that it has been and is the custom of the trade that walking time is not paid when men are engaged and paid on a job outside the area. When the breach of the rules is admitted, there is then left the question of the penalty imposed, and with respect to this I may be permitted to point out that when the quantities for this job were sent out a penalty for a breach of contract in regard to hours of labour, etc., was fixed at three times the amount of wages in dispute, and as in this case the wages in dispute were under 30s., it will be seen that the fine of £24 imposed is altogether out of proportion, especially when the foregoing facts are taken into consideration." The City Hospitals Committee have now passed a resolution for consideration by the City Council that the proposed deduction of £24 be reduced to £12.

Proposed New Works.

Arbroath.—Plans for the new railway station, which is to cost between £30,000 and £40,000, have been finally approved, and constructional work is expected to commence in March, 1909.

Cork.—The Corporation have decided to adopt the Corn Market site for the erection of the proposed technical institute.

Cowes.—A new church is to be built at Cowes. Princess Henry of Battenberg has consented to lay the foundation stone.

Craghead. — Towards the erection of a new church, £1,500 is promised by the Ecclesiastical Commissioners, and a donation by the owners of Craghead Collieries.

Dundee.—A garden city is to be created here, consisting of working men's dwellings, costing between £250 and £350.

Howden.—For proposed works at the parish church of St. Peter, which include the hanging of the church bells, renovation of the organ, and restoration of the south transept, the sum of £1,000 is required.

Kingston Hill.—Towards the completion of St. Paul's Church, and purchase of a house for a vicarage, the estimated cost of which is £6,675, £1,500 has already been promised.

Manchester.—The libraries committee have announced that a gift of £5,000 by the late Mr. Thomas Greenwood, is to be invested, and the proceeds applied to the extension of the library now in King Street.

Musselburgh.—It is proposed to erect a free library and recreation rooms here.

Nottingham.—Plans by Mr. A. E. Lambert, for a new Wesleyan mission institute, which is to comprise four floors and a mezzanine floor, have been approved by the Corporation. The estimated expenditure for erection is £32,000.

North Shields.—It is proposed to erect a new Y.M.C.A. building for the Borough of Tynemouth, the estimated cost of which, including site, is £4,500.

Peckham, S.E.—The London County Council, after considering a report of the Education Committee dealing with the proposed enlargement of the Oliver Goldsmith Schools, Peckham Road, agreed that, subject to the Board of Education approving the plans, the tender of Messrs. J. and C. Bowyer, Ltd., of Upper Norwood, for £5,763 for enlarging the school by 368 places be accepted. In connection with the matter, the Finance Committee pointed out that the cost of the proposed enlargement was equivalent to £17 8s. 11d. a place, which was rather a high figure. The amount which the late authority would have been allowed by the Board of Education was less than the expenditure now proposed, but the committee were advised that the enlargement involved the provision of certain accessories which necessarily enhanced the cost of a small enlargement.

Plymouth.—The plans of Mr. Coath Adams, for the proposed swimming bath and Turkish baths, estimated to cost £5,000, are under the consideration of the Corporation.

Rugby.—Major J. Stewart, R.E., has held a Local Government Board enquiry with respect to an application by the council to borrow £4,200, for the erection of public baths.

Shrewsbury.—It has been recommended that the sum of £4,000 be expended for the purchase of property at Roushill, for the erection of new stables, and as a yard for the Corporation horses and carts.

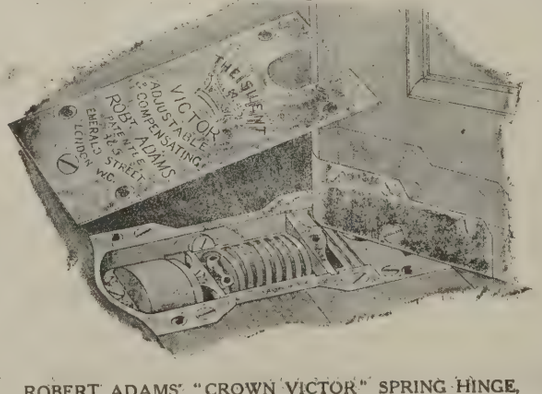
Westminster.—Dean's Yard is to be repaired, and the footway repaired at a cost of £276, a sum which the City Council will refund to the Dean and Chapter.

Works in Progress and Completed.

Annfield Plain.—The new free public library opened on Dec. 16th, is of stone, with a frontage of 60 ft., and a depth of 70 ft. Mr. Andrew Carnegie contributed £3,000 towards its erection.

Chiswick.—Foundation stones of the new Wesleyan church, which is to cost £5,781, have recently been laid.

Doncaster.—The Market Committee of Doncaster have accepted the tender of Messrs. Gill and Son, builders, for the work in connection with the extension and improvement of the cattle market. The tender amounts to £3,997, and is subject to the approval of the Council.



Dover.—Messrs. Pearson and Son's tender has been accepted for widening the Admiralty Pier to the Dover Marine Station. The widening will cost about £400,000.

London, E.C.—The Blackfriars subway scheme which was formally inaugurated on Friday, December 17th, provides for a subway of about 400ft. long, starting just past the cabmen's rest on the Embankment, to a point adjacent to the Hand-in-Hand Assurance offices in Queen Victoria Street, and a cross subway of about 120ft. long from Blackfriars Station to the opposite corner of New Bridge Street and the Embankment. These subways will be 10ft. 3in. wide and 8ft. high. They will be constituted of walls 3ft. thick, and roofing of steel, the exterior being composed of white tiling. In all there will be four entrances or exits, and some twenty steps will have to be descended or climbed in each case. The work, being divided into three sections, and, given no unusual impediments in the way of unsuspected pipes, culverts, and so on, it may be completed in the period mentioned, estimated by the contractors, Messrs. Perry and Co. (Bow), Ltd. The first section to be taken in hand is on the Blackfriars and Embankment side, and this necessitates the diversion of a tube carrying gas and other mains. This will be carried under the subway, which in its turn will be just above the Underground Railway. These are the only difficulties as yet known—excepting, of course, the old Fleet sewer—others may have to be encountered.

London, W.C.—No fewer than eight large blocks have been completed, or are nearing completion on the London County Council's Kingsway during 1908, giving it something like the appearance of a continuous street. Building began at the northern end, and is gradually extending towards the Strand. On the widened part of Southampton Row, from Theobalds Road to Holborn (which is the northern extension of Kingsway) every site is built on, on both sides of the street; the last block, a large one, chiefly of stone with central and corner turrets, having just been completed. In Kingsway itself, from Holborn to Great Queen Street, the west side was completed last year; while this year a handsome block of offices has been built over the Tube Station, and blocks below it have been opened, and another one is building, leaving only room for one more block on the east side. Between Great Queen Street and Aldwych, large mission buildings, with a dome, are nearly finished on the west side, and opposite it a large block of offices are ready for roofing. Lower down, the site is being cleared for the erection of the Veterans' Club, and adjacent to this is the large bank (the second on Kingsway), which has just been opened. All these buildings are of stone. On the eastern side of Aldwych, adjacent to Carr's Restaurant, a site has been secured for an insurance office. On the island site in the Strand, the offices of the Government of Victoria, surmounted by a dome with winged female figure, are nearly completed; and many people will regret that the Council are unable to come to terms with the Australian Government for building the rest of their new offices there.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Dec. 24. ALVES (Scotland).—Mason, carpenter, slater, plumber, plaster, painter, and glazier works of restorations, after fire, at Cloves Farm, Steading, Alves. Plans and specifications may be seen with C. Doig, architect, Elgin, and tenders lodged with him by Dec. 24.

Dec. 24. ABERDARE.—Erection of a receiving home for children at Aberdare, for the Merthyr Tydfil Board of Guardians. Plans and specification may be seen at the Training School, Trecynon, Aberdare, or at the office of T. Roderick, architect, Clifton Street, Aberdare, from whom bills of quantities may be obtained. Fair wages clause. Sealed tenders, endorsed "Tender for Receiving Home," must reach F. T. James, clerk, 134, High Street, Merthyr Tydfil, by 6 p.m. on Dec. 24.

Dec. 25. PAISLEY.—Several works proposed to be executed in connection with erection of Workmen's House, at Stanely High Level Filters for the Town Council: Digger, mason and brickwork; joiner and painter work; plumber work; plaster work; slater work. Schedules of quantities may be obtained at the office of the Master of Works, 13, Gilmour Street. Sealed tenders, marked "Workmen's House at Stanely High Level Filters," to be lodged with F. Martin, town clerk, Municipal Buildings, Paisley, not later than Dec. 25, 10 a.m.

Dec. 26. WICK.—Mason, carpenter, slater, plasterer, plumber, glazier, and painter work, also the iron and heating engineer work of the new Higher Grade School proposed to be erected by the Board. The plans and specifications may be examined at the office of D. W. Georgeson, clerk, Wick, or at the office of D. and J. R. Macmillan, Board's architects, 105, Crown Street, Aberdeen, from whom schedules of quantities may be obtained on application. Offers, marked "Tender for New School," must be lodged with the clerk on or before Dec. 26.

Dec. 29. LIVERPOOL.—Taking off and removing roofs over swimming baths, and for the construction of new roofs thereon, at Margaret Street Public Baths, for the Liverpool Corporation. Plans and specifications may be inspected, and quantities obtained, on application to W. R. Court, engineer and chief superintendent, Municipal Offices, Liverpool, on payment of £1 1s. Tenders, endorsed "Tender for Roofs, Margaret Street," must be delivered by letter post not later than 10 o'clock a.m. on Dec. 29.

Dec. 30. ARMLEY.—Erection of 8 houses for Mr. Abbott. Tenders are wanted for slaters' plumbers', and painters' works. Plans and specifications may be seen at the office of J. A. Webster, architect, 2, Basinghall Square, Basinghall Street, Leeds, up to Dec. 30, when sealed and endorsed tenders are to be sent in.

Dec. 30. LONDON, S.E.—Execution of certain work in connection with the provision of additional lavatory accommodation for the Guardians of the Poor of the Parish of Lambeth, at their workhouse in Prince's Road, Kennington Road, S.E. Tender forms and specifications of works, with conditions annexed, will be supplied on application to the office of J. L. Goldspink, Clerk to the Guardians, Guardians' Board Room and Offices, Brook Street, Kennington Road, S.E. The tenders, which must be sealed and superscribed "Tender for Lavatory Accommodation," must be sent to the clerk, or placed in the box provided for their reception in the office of the Clerk to the Guardians by the contractors or their representatives, if they so desire, on or before ten o'clock on Dec. 30, and will be opened in the Board Room at noon on that day.

Dec. 31. BILBROUGH.—Altering the premises and school yard, at the Bilbrough Provided School, near York. Specifications may be obtained from F. Parker, divisional clerk, Education Offices, Selby, and tenders must be forwarded not later than Dec. 31.

Dec. 31. PENZANCE.—Erection of two dwelling-houses and shops in Market Jew Street, Penzance, for J. Matthews. The drawings, etc., may be seen, and all further particulars had, on application to N. C. Whear, jun., architect, Penzance. Tenders must be delivered by Dec. 31.

Jan. 5. LITTLE HULTON.—Erection and completion of central premises at the junction of Clegg's Lane, and Manchester Road, Little Hulton, near Bolton, for the committee of the Little Hulton Industrial Co-operative Society, Ltd. Quantities and forms of tender may be had from J. T. Proffitt, architect and surveyor, 9, Longley Road, Walkden, after Dec. 24. A deposit of £1 will be required for same. Sealed tenders, endorsed "Tender for Central Premises," to be addressed to the chairman of the Society and delivered to E. Gorton, secretary, 470, Manchester Road East, Little Hulton, near Bolton, not later than 5 p.m. on Jan. 5.

Jan. 6. LONDON, N.E.—Provision of a subway between the new administrative block and pavilion "D" of the Infirmary, High Street, Homerton, N.E., for the Guardians of the Hackney Union. The specification, conditions of contract, and plans may be seen at the office of F. R. Coles, clerk to the Guardians, Hackney Union, Sidney Road, Homerton, N.E., by persons desirous of tendering, and bills of quantities and form of tender will be furnished upon deposit with him of the sum of £1 1s. Securities required. Sealed tenders, endorsed "Provision of Subway at Infirmary," must be delivered at the clerk's office not later than 2 p.m. on Jan. 6.

Jan. 7. BRACEBRIDGE HEATH.—Contract No. 4.—Construction of an absolutely watertight covered concrete service reservoir of 6,000,000 gallons capacity, and subsidiary works at Bracebridge Heath, near Lincoln, for the Lincoln Corporation. Drawings may be seen, and specification, bill of quantities, and form of tender obtained at the office of N. McK. Barron, Waterworks Engineer, Lincoln, upon payment of the sum of £5 5s. Sealed tenders, endorsed "Tender for Reservoir," and addressed to the Chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, deputy town clerk, Bank Street, Lincoln, on or before Jan. 7.

Jan. 7. WESTGATE, Lincoln.—Contract No. 5. Construction of a brick tower 106 ft. high to T. W. L. to support a spherical bottomed steel tank, containing 300,000 gallons of water, and subsidiary works, at Westgate, Lincoln, for the Corporation. Drawings may be seen, and specification, bill of quantities, and form of tender obtained, at the office of the engineer, Mr. N. McK. Barron, Waterworks Engineer, Lincoln, upon payment of the sum of £5 5s. Sealed tenders, endorsed "Tender for Water Tower, Section No. 1," and addressed to the chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, deputy town clerk, Bank Street, Lincoln, on or before Jan. 7.

Jan. 7. WATFORD.—Erection and completion of a new manual instruction centre at the Victoria Senior Boys' County Council School at Watford, for the Education Committee. Persons desirous of tendering for the work may see the drawings, specification, agreement, etc., at the County Surveyor's Office, Hatfield, on or after Dec. 18, between the hours of 10 a.m. and 4 p.m. (except on Saturday, when they may be seen from 10 a.m. till 12 noon). A copy of the schedule of works (quantities) and a form of tender can be obtained at the County Surveyor's Office on or after the above-mentioned date upon payment of £2 2s. Sealed tenders, endorsed "Tender for Manual Instruction Centre, Watford," must be delivered to U. A. Smith, county surveyor, County Surveyor's Office, Hatfield, not later than 5 p.m. on Jan. 7.

Jan. 7. ABERYSTWYTH.—Erection of additional class rooms, manual training room, cookery centre, and other work at the Alexandra Road Council School, Aberystwyth, for the Cardiganshire County Education Committee. Persons desiring to tender are requested to send their names to G. Dickens-Lewis, county architect, North Parade, Aberystwyth, together with a cheque for £2, when they will be supplied with full particulars and form of tender. The drawings, specifications, and conditions of contract can be inspected at the architect's office any time during business hours. Securities required. Tenders, which are to be sent in on forms supplied, sealed and endorsed "Estimate for School Extension," must be delivered addressed to R. J. Roberts, District Education Office, Aberystwyth, by 12 o'clock midday on Jan. 7.

Jan. 8. SHINFIELD.—Erection of a new school for 250 scholars at Hyde End, Shinfield, Berks., for the Education Committee. Builders desirous of tendering are required to send in their names to The Secretary to the Education Committee, The Forbury, Reading, by the first post on Dec. 24, together with a deposit of £3 3s., for bills of quantities, which will be supplied by post. Plans, specification, and form of contract will be open for inspection at the Education Secretary's office on and after Dec. 29, between the hours of 10 and 5. Tenders must be delivered at the office of the Education Secretary, on the form and in the envelope provided, not later than the first post on Jan. 8.

Jan. 8. SALISBURY.—Construction of a brick built water tower and tank and works incidental thereto on the Bishops Down Estate, for the Ecclesiastical Commissioners for England, and their surveyors, Messrs. Cluttons, 5, Great College Street, Westminster Abbey, S.W. Plans and specifications prepared by Lemon and Bliard, engineers for the works, acting on behalf of Messrs. Cluttons, may be inspected at their Salisbury office, and copies of bill and quantities obtained on depositing the sum of £2 2s. Sealed tenders on the forms provided, endorsed "Tender for Water Tower, Salisbury," to be sent to the engineers, 29, Market Place, Salisbury, Wilts, before 4 p.m. on Jan. 8.

Jan. 13. SUTTON, near Southend.—Erection of a new school at Sutton (near Southend-on-Sea), to accommodate 160 children), for the Rochford Hundred district committee. Builders desirous of tendering are required to communicate with F. Whitmore, architect, 73, Duke Street, Chelmsford, not later than Dec. 24, and to enclose cheque for £2 2s., when bills of quantities will be sent as soon as ready. Plans, specification and form of contract can be seen, either at the offices of the architect or H. Bell, district secretary, County Chambers, Weston Road, Southend-on-Sea, between the hours of 10 a.m. and 5 p.m., on any working day except Saturday. Securities required. Ten-

ders sealed and endorsed "Sutton New School," should be forwarded to the offices of the District Committee at County Chambers, Southend-on-Sea, by 12 noon on Jan. 13.

Jan. 14. LITTLE COATES, LINCOLN.—Building an Elementary School at Little Coates, in the county of Lincoln, for the Lindsey C.C. Education Committee. Bills of quantities and form of tender may be had on application to Scorer and Gamble, architects, Bank Street Chambers, Lincoln, on or before Dec. 31st, and on payment to them of £2 2s. Some Important Buildings of the Year—

Gymnasium for University College, Aberystwyth 15
Church of "Our Lady of Willesden," interior 15
Portable Garage at Lewisham 15
Factory for Messrs. Rowntree and Co., York 16
House in Monolithic brickwork 16
Power Station in Monolithic brickwork ... 16
The Choir, Downside Abbey, near Bath... 113
"The Morning Post" Offices, London ... 115
St. Mary's Church, Highweek, Devon ... 119
The London, Edinburgh and Glasgow Assurance Building, London 122
The Waldorf Hotel, London 126
Offices for the River Wear Commissioners, Sunderland 131
Mansion Flats, London 135
New Premises for Debenhams', Ltd., London 140
The Mersey Dock and Harbour Board Offices, London, ... 145
New Public Offices, Westminster 151
The Hamburg-Amerika Linie Building ... 160
The Piccadilly Hotel, London 165
Branch Library, Greenwich 170
Public Library, Aberdeen 173
New Premises for Mappin and Webb, London 174
New Royal Infirmary, Manchester 177
Additions to Goldsmiths' College, New Cross 183
Norwich Union Society's Head Office, Norwich 186

Some Reinforced Concrete Buildings of 1908—

Government Buildings, Jamaica 7
Bonded Warehouse, Washington Street, Glasgow 110
Telephone Exchanges, Cambridge, Dalston, and Manchester 111
Holborn Tube Station, superstructure, London 112
Scottish Provident Institution Building, Glasgow 112
Wouldham Cement Store, West Thurrock, Essex 112
Union of London and Smiths' Bank, Hull, the Cupola 187
New Works, British Aluminium Co., Kinlochleven 187
Extension of Caxton House, Westminster ... 188
Bradford Football Stand 189
Kodak Co.'s Premises, Wealdstone ... 189
Selfridge Stores, London 190
Blackley Stores, Liverpool 190
General Post Office, Extensions, London ... 191
Warehouse, West Bar, Boar Lane, Leeds ... 192
Second Tobacco Warehouse, for Bristol Corporation 192
A Hospital Ward 192
Motor Garage, Brighton 193
Albert Foundry, Belfast 193
White Steam Car Co.'s Motor Factory, London 193
Additions to the National Gallery, London 194
New Record Office for the Bank of England 194
Foundations, New Wesleyan Office, Westminster 194
Hull, General Post Office... 195
Loch Leven Water Power Conduit 195
Reinforced Concrete Bridge 195
New block to hospital Royal Naval Training Establishment, Shotley 195
New Telegraph Stores, Birmingham 196
Norwich Union Building, Piccadilly, London 197
Bridge for East Ashford U.D.C. 197
St. Charles' Chapel, Notting Hill 197
Model Bakery, Franco-British Exhibition 197
Rhyl Pavilion 198
Factory at Cleckheaton, Yorkshire 199
Upper Floor of Factory, near Bradford ... 199
Whitbread and Co.'s Croydon Stores ... 200
Bournemouth Gas Works, Poole 200

THE ROYAL INSURANCE BUILDINGS, ST. JAMES'S, LONDON. JOHN BELCHER, A.R.A., ARCHITECT. (See page 13).

December 30, 1908.

Volume 28. No. 725.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.

Caxton House, Westminster.

TO ALL OUR READERS AT HOME AND ABROAD: A HAPPY AND PROSPEROUS NEW YEAR.

Our Special Issue.

This special issue of THE BUILDERS' JOURNAL can need but a brief foreword. We prefer it to speak for itself. It represents a very earnest endeavour to gratify the diverse tastes, and meet the various interests, of all sections of our readers, professional, industrial, and commercial. The principal feature—an epitome of the history of English architecture—with its uncommonly fine series of illustrations of noble buildings, is, we would hold, not of merely sectional interest, but makes the widest possible appeal; and the same general interest can be claimed for the representative collection of men of mark that we are able to show. These, and the accompanying biographical notes, add to our special issue a spice of human and personal interest that, we feel sure, will be highly appreciated by all. We have made this collection of portraits as fully representative as circumstances would permit; and we think it will be acknowledged that neither in this respect nor in presenting brief summaries of the year's transactions of the various associations, and of the building operations of a perhaps rather uneventful twelvemonth, have we allowed the provinces to suffer unmerited neglect. We believe in fair play for the provinces, and for any neglect in this direction we are not consciously responsible. Our friends in the country can at all times count confidently on our most sympathetic attention, as we think they already know. The historical section is, we take leave to assume, no whit the worse for having been in part seen before. Some of it appeared in connection with the last London International Congress of Architects; but the articles have now been revised and, in some instances, considerably amplified by their respective authors; and the very fine illustrations have been carefully rearranged, with judicious suppressions and additions. The volume—for so we may venture to call it—that we now have much pleasure in submitting to the reader, represents, we need hardly say, a vast amount of hard work; in which, however, the Editor has been greatly cheered and encouraged by the ready and kindly courtesy of those from whom he sought authentic first-hand information and other valuable help and advice. To these he offers his warmest acknowledgments and most sincere thanks. We think that we are justified in claiming that our special issues are quite without parallel in the journalism of the professions and trades that they represent. At any rate, we are content to advance them in manifestation of the energy and enterprise with which THE BUILDERS' JOURNAL is, we trust, always conducted.

By-laws and the Big Stick.

Councillor Highton, in an address on the eternal housing question, delivered at Blackburn, seemed to think that the whole problem lies in a nutshell. Reform the by-laws, and control town development, and the problem is solved. Our present inelastic by-law system, he contended, harassed individuals unceasingly on all sorts of details without preventing land speculation and jerry building, and it did not attempt the one thing that might be useful—comprehensive control of town development. The present difficulties arise partly from the great increase during the past quarter of a century, in the cost of labour and materials, but perhaps more especially from the stringency, which is both expensive and harassing, of procrustean by-laws, and, most potent of all, the deterrent of private building enterprise is the competition, actual or potential, of municipal authorities, who build with unnecessary extravagance and throw their losses on the rates. This wastefulness sets up a vicious circle; for in sending up the rates it greatly discourages the erection not only of working-class dwellings, but of buildings of every description. A rate-burdened population loses heart and enterprise. With regard to municipal housing, Councillor Highton maintained that public bodies would render better service to the community if they refrained from building, and contented themselves with lending money under the Small Dwellings Acquisition Act. He thought, also, that by modifying their by-law so as to enable the building of houses at reasonable prices, corporations would go a long way towards solving the housing problem. There are doubtless many instances in which by-laws might be judiciously relaxed without the slightest risk to the health and comfort of the community; but, unfortunately, as Councillor Highton pointed out, there is a general and not wholly inexplicable disposition, on the part of local authorities, to accept from their officials any suggestion that tends towards stringency, and he might have added that there is an equally marked and equally comprehensible disposition on the part of officials to put forward such suggestions. But "officialdom" and overzeal in the exercise of "a little brief authority" are not, it may be supposed, entirely beyond restraint. The spirit in which by-laws are interpreted and administered may be made almost as effectual as the letter; and any tendency to extreme vigour may, we think, be corrected by such action as some of the master builders' associations have lately taken. Councillor Highton expressed the opinion that it was "the duty of a corporation to try to work with the private builders, and to fix upon a type of house which would not only be acceptable to the local authority, but would meet the needs of the general body of workers." The desirability for "consulting the men who know" is certainly not confined to this single phase of building operation; and therefore we think that the local associations of master-builders are acting well within their rights in pressing home their claims to consideration in matters in which their interests are affected or threatened, or in which their advice is otherwise beneficial. As our Federation reports have shown, such intervention has been in some instances signally effective; and this success in correcting the visual angle of local authorities should be strenuously followed up. That it has been achieved is a welcome proof that even local authorities are amenable to reason when they are properly approached; or, as a cynic might say, that they are not wholly indifferent to the "big stick" of organised opinion.

Priest as Architect.

For many weeks past the "Tablet," an influential organ of the Church of Rome, has been flooded with letters on building. It seems that the laymen of the faith have a grievance against their ghostly advisers. The complaint is that too many churches are being built by priests, to the detriment of those who, while they may perhaps be studious for orders, holy or otherwise, have not yet assumed the tonsure. Many architects, it appears, have turned priests, while we gather with less certainty, from a casual glance at the very voluminous correspondence on the subject, that some few priests have turned architects. Thus do both roads lead to Rome; and in either case the layman feels that he has a full-blown grievance. He more than hints that the clerical architect works for less than the accustomed fees. So far as we can see, this sordid view has not been sustained. One or two of the priest-architects have denied that they have worked for less than the recognised rate. As might have been anticipated, the clerics took the earliest opportunity of lifting the controversy to a far higher plane. One of them has been "rather shocked at the low views of art (in the wide sense of the word) implied in some of the letters." Some correspondents talk," he says, "as if the designing of a church were a thing to be learnt, a matter merely of patient study. Alas! many others think so; that is why one wanders through most of our churches desolate, comes away from much carving, marble, and wasted labour, with a sense of misery. The divine spark is not there." The gentleman who wrote that passage has much

more to the same effect. It is all very fine, but it evades the point at issue. Yet for this gear we could love him: "Does a man who really cares about art mind who produces something beautiful, so long as it is produced? . . . . I know that it is difficult as one grows older to preserve a shred of an ideal, and that one illusion is torn away after another. I still cling to my belief in the real artist. Angelico, with his brush and colours, has done good to the world for 500 years. Perhaps some painters were once cross with him, and said that he ought to be doing the work of his monastery instead of taking the bread out of their mouths. Religion is a subtle thing. Angelico has by his art spoken it to many millions whom he could reach in no other way. Who shall say that his religious training was useless in helping him to speak?" It now begins to dawn on us that the gentleman who started this controversy is pretty much in the condition of the man who went out to shear and came back shorn. He could hardly have reckoned that Angelico would be thrown at his devoted head; but he might have remembered that he was adventuring his body and soul amongst the skilled masters of dialectic; who, moreover, make a cult and a merit of fasting and abstinence, and might be expected to make light of the bread-and-butter question. It only remains for him to repent in sackcloth and ashes for daring to stick up for his rights. He will hardly be able to smile with us at this naive conundrum, propounded by another clerical antagonist: "Was it lawful for St. Paul to supplement his spiritual earnings by making tents (which, by the way, was the architecture of the desert), or is there any secular architect who is bold enough to condemn St. Paul and so many of our French clerical brethren? . . . " Yes; it is a most unequal contest, and whoever started it must be feeling that he is indeed a very profane person. He may have thought, at the outset, that priests were best employed in the edification of "churches not made with hands." We also might have arisen from a perusal of these letters with the firm conviction that only a priest was fit to build a church; but within a stone's throw of our offices stands Westminster Cathedral, and we are under the impression that its architect was a layman. The priests' sacrosanct theory of art is very alluring; but then, so is Mr. Felix Clay's ultra-materialistic view of the æsthetic sense; and between these opposite poles there is an ample field for the exercise of plain common sense.

Torrak and Wrack.

A rather alarmist writer, whose object was obviously political rather than industrial, having contributed to the "Morning Post" a jeremiad on the ruinous importation into this country of "Diseased Foreign Timber," which we are evidently expected to regard as the refuse of Sweden, Mr. Louis Zettersten points out that the hater of imports has allowed his political fervour to betray him into error. The writer, in dealing with "torrak" and "wrack," had classed the two kinds together, although they are very different in quality. Torrak, Mr. Zettersten maintains, is a very dry timber, and "nothing can be better as a building material," and it is not true, as the anti-importer stated, that "the Swedes never use such wood." On the contrary, experienced builders in Sweden are now using it extensively, and the export is rapidly declining. "Wrack," on the other hand, is an inferior quality of timber which cannot be used for house building; but this quality has for a long time been used by the Swedes themselves "for scaffolds and similar purposes." It is marketed under a special name, and at a specially cheap price. Why then, blame the Swedes? The cool implication that the Swedish exporters are rogues, and the English buyers fools, or worse, does not count for much in this country, where it is instantly recognised as a symptom of the dry rot of party politics; and, from the admirably temperate tone of Mr. Zettersten's letter, it may be gathered that he does not take too seriously the imputation cast upon his countrymen by a perfervid pseudo-patriot. But there is some small amount of real technical interest in Mr. Zettersten's disquisition on torrak and wrack.

Critics of Architecture.

A few weeks ago we had occasion to protest against the splenetic strictures of a French critic of American architecture, who saw nothing good in it, and who was particularly indignant because the Americans did not invent their own details. He might as reasonably complain that American authors do not invent their own words (as to some extent they do!); for surely correct architectural composition is the combination of recognised elements. We now find an English critic going out of his way in order to eulogise the architecture that the Frenchman condemned. The Englishman, in describing the recent exhibition of the work of Royal Academy students, writes: "The designs for architecture remind us too painfully that in this art, the first and most important of all the arts, we are far behind America in adaptability to modern requirements, originality, and beauty. American architecture is generally associated with sky-scrapers. These are usually laughed at by those who have never seen them, nor even pictures of the beautiful modern churches and modern houses throughout the United States. We have brilliant architects, no doubt, but no architecture, or perhaps no public to appreciate it." The Americans may now smile again—perhaps a little sarcastically, since they must feel that the Englishman's praise is only a shade more just than the Frenchman's blame. But the Englishman—if, indeed, he is not an American writing in an English newspaper—need not have extolled American architecture at our expense. Americans have not been slow to express their admiration of English architecture, and have given tangible proofs of their sincerity by inviting some of our best men to build for them; and we are sure that in England there has been no lack of generous praise of American work. Yet doubtless the two countries have much to learn from each other, but the expression of immoderate views will not assist the process. The statement that we have brilliant architects but no architecture is a curious sort of paradox to base on an adverse criticism of students' designs. If it was not "writ sarcastic," it must have been written in a hurry, by one who, although he admits that "Architecture is the first and most important of all the arts"—"the Mistress Art," as Mr. Blomfield calls it, with more brevity and beauty—was more conversant with the mysteries of brushwork, and made a false step the moment he quitted his own domain. The French critic, by the way, was a sculptor; and a painter and a sculptor disagreeing about Architecture rather reminds one of the pantomime freak between the sweep and the baker.

By-Law Blandly Interpreted.

A very nice point has been debated and determined by the Sunderland Town Council. Plans for a tall chimney that had been submitted by Messrs. Tyzach for approval were, technically not in conformity with the by-laws. Nevertheless the building committee recommended that the plans should be passed, because the borough surveyor had given assurance that the chimney as proposed to be built would be more safe than if it were built in strict accordance with the by-laws of the Corporation. This put the Council in a dilemma. Should they insist on the strict observance of their by-law, and worsen the chimney? Or should they allow the chimney to be built in the best way, and thus stultify their by-laws? The matter was keenly debated. There were, of course, inflexible councillors who stood out for the letter of the law. One Councillor maintained that the Council should "stick to" their by-laws; another that they should stand by them; a third, that they should "observe the law in their integrity." In the upshot, the Council did none of these things. They passed the plans by thirty-seven votes against thirteen; thus showing that, as a whole, they preferred the spirit to the letter, and were not to be beguiled by the cant phrases of the rigidly righteous. They are to be congratulated on their courage in interpreting an obvious and abortive by-law in the light of common sense fortified by expert opinion. It does seem, after all, to be a very heroic course to adopt; but it is not every Council that would dare to take it.

The Coming Boom.

Now is the time to build. That is the advice of the timber merchants. This seasonable hint (it is certainly seasonable at all times of the year, but most especially when business is most slack) was dropped, frequently, and in several places, at the annual dinner of a firm of timber merchants at Dundee. But the speakers had an object (perhaps they had more than one) in urging that the immediate purchase of timber is a matter of moment. Never again may timber be so cheap. Its price is going up, and the supply is being rapidly exhausted. It may be that in thirty years' time there will be no timber to buy. It would be wise, therefore, to lay in a good stock to-day, while it is to be had comparatively cheap. Dundee is not alone in tendering this advice. From Königsberg comes the news that the prices of timber there have been considerably strengthened in consequence of a largely increased demand for building wood, and "the situation has so much improved that the banks have signified their readiness to advance money on goods." The demand for timber has arisen all over Germany, where the building trade is becoming exceedingly brisk. Baulks of all sorts have risen in price, and the sawmills are overwhelmed with orders. We can only trust that the news is not exaggerated, and that the many's example may be quickly followed in this country.

"THE FUNCTION OF COLOUR IN STREET ARCHITECTURE."—I.

By P. M. Stratton, A.R.I.B.A.

I.—One autumn it was my fortune to visit Bristol, and afterwards to wander across Clifton Downs until forced to halt on the edge of the Avon Gorge. Far below, the silver waterway carried red and black ships, going up to Bristol Docks, or being taken down to the sea by noisy tugs. And on each side rose a vast many-coloured wall. On the right hand the wall was of stone, innocent of the touch of saw or chisel, and left all jagged and torn as when it had first been heaved up. But the wind and rain had beaten on it, the sun had caressed it, the iron in the stone had crept out and stained its face, so now to a half-closed eye the whole front seemed a mass of dull gold. But this was a background only, for russet and silver lichen, yellow fungi and green moss, which lit it up here and darkened it there, but always added life and fire to the mass. The further side of the river rose as steeply from the water's edge, but was clothed in autumn leafage. Along the slope the silver trunks of the birches shone through their thin foliage of delicate yellow. Further up, a clump of beeches was set like a jasper among the dull green of the oaks.

Later in the day found me walking down a typical London street, where every building was covered with a veil of soot. Here and there a little brickwork seemed to have escaped from its vesture to peep forth with a dirty red face and some new buildings of stone showed up like apparitions amidst the general dinginess. Indeed, it seemed a city of black shrouded corpses and pale ghosts. In the suburbs I knew there was a more striking and brazen disregard for the beauty of colour; for there the shops and houses showed little character but that of dull greed or cheap display.

Street architecture needs to furnish a substitute for the gorgeous and tender hues of the natural environment of man, which is as necessary to the health of his being as sunlight is to the leaf. Especially do the dwellers in manufacturing cities require some brightness of colour to quicken the dying embers of beauty within them. The children must be able to find the gay surroundings which their eyes by instinct and unconsciously are seeking; and the men and women must be helped to keep green the memories of field and hedgerow.

Therefore, let all colour schemes be founded on nature, so that her endless harmonies, contrasts and gradations may be transported to the towns. Let the architect of cities study her among the hills that heather clothes with a purple mantle. There he follows a path that is all yellow and gravelly in the centre, with an edging of short grass hung over by the shimmering blue of hairbells; for nature loves to adorn her margins. He will find mountains and hillsides are somewhat monotonous in hue, the formation of the earth takes a sober colouring that enhances its expression of Titanic energy or of calm strength. Thus the mains of Alps and Appennines are for ver white with snow; high precipices and like the Cornwall cliffs, black or rey from top to base. And in like manner that monochrome of Florence lies he Pitti Palace, bearing "a stern expression of brotherhood with the mountain eart from which it has been rent."

On the other hand, where form is meaningless or wanting in vigour, there colour should be strong and vivid and in great variety. Yet the bricks of the ordinary blank wall are generally specified to be carefully assorted to match in size and tint. A much happier effect would be created by the introduction of stone here and there into brickwork whose red should darken into purple, and be flecked with orange, and coursed occasionally with flints that shine like inlaid mother-of-pearl. Nature, indeed, often reserves her most vivid and startling contrasts for objects of mean or grotesque outline. The crimson toadstool and the piebald pony bear a direct relation to the quaint figures and heraldic devices of colour decoration.

All gradation must be left solely to the hand of Time to accomplish, unless, indeed, mosaic is adaptable to such an end as perpetuating the hues of a clear sky just after sunset, when the red on the horizon changes slowly through purple to the light blue above.

A careful study of the organisms, rather than the scenery of nature, will reveal that form is constantly defined with colour, but the anatomy, the building up, as it were, of a body is generally ignored in surface decoration. In all definition of features, the contrast is never so sharp as to make the part appear detached from the whole, as often happens in architecture. In some facades of brick and Portland stone, for example, the white piers and cornice and base are too much like a skeleton with the space filled in between by a red wall veil.

So being bound in a perpetual apprenticeship to nature, the architect will find his colouring approach more and more nearly to her perfect harmony. The vicious greens and vulgar reds that now stand in dead aloofness in our streets will be replaced by the golds and russets of the falling year, the pure white and black of winter, with April's living green, and

"All glaring pomps,
Which triumph at the heels of sovereign June,
Leading his glorious revel through our world."

II.—From an objective point of view, therefore, the city dweller needs an environment of colour. Moreover, an architecture of colour will be his natural expression. Man, that his being may expand, must come into contact with his fellows, as well as with Nature, so in crowded streets qualities appear that would have remained dormant in the country, character that would have stayed undeveloped in comparative solitude. Here, thought leaps to answer thought, wit to anticipate wit, skill in handicraft or games goes forth to win a name or fail, lessons are learnt of comradeship and sacrifice for a cause. The gorgeous 'buses, the costers' barrow green and red, and the prevalent purple of the London lassies' costume are all crude and barbarous attempts to express the romance and variety of city life. But modern architecture fails to do so, chiefly, I believe, through this lack of hue. All cities where art has flourished in the past have been far brighter in reds, yellows, and blues than the country towns and villages, for their life has been quicker, and in them the destinies of the world have been decided.

The turbulent democracy of Athens dwelt, I suppose, in streets more highly coloured, if anything, than their temples, but there is little certain information about the Greek cities. We know more of Rome. Snowy Carrara came down the Italian coast and up the Tiber for the arch of Constantine and columns in the Forum; from Numidia were transported unrivalled reds and yellows, and the blood-coloured breccia; Greece and Euboea gave their store; rose tinted onyx was shipped across from Algeria, onyx, too, from Egypt; and purple porphyry starred with crystals came in barges down the Nile.

Later, we find Venice, "a golden city, paved with emeralds. For truly every pinnacle and turret glanced or glowed, overlaid with gold, or bossed with jasper." The violent, furious city life of Florence was typified in the highly-coloured buildings; scarlet bricks and tiles, red terra cotta, yellow stone, and marble of every hue, were piled up in her streets in mingled and contrasted loveliness. Often the brightest patches of colour were laid on the roofs. Their red tiles are no purer in tint than those of similar ogee shape used round London, but they are brought down more into the street by porches over doors, roofs over shops, and bay windows. The brightness of the roof is set into the delicate pallor of the stucco, and green shutters add a third note to complete the scheme.

The street buildings of our ancient English towns are a delightful jumble of styles and a feast of colour. An old inn which hangs dark mullioned windows over the footway generally dominates the street. Its painted sign, bright blue, is held up with iron rods, wreathed round by scrolls and leaves that shine with gilt. Its walls are covered with light yellow plaster between black posts of oak. Down each side of the street red surfaces of brickwork surround green shutters and window framing, where houses have grown up in Stuart and Georgian times between the brown hanging tiles and striped half-timber work of earlier buildings. The warm-looking roofs of gables slice their colour into the blue and white of cloudy skies; and where the street ends an archway of grey stone, with windows and battlements over, half warns you away from sacred precincts, and half beckons you through to the green sward and hoary walls of the shrine round which the city clusters.

Most European cities of any antiquity are at one in this outward sign of gay colouring, and they are at one, also, in attaining this expression each in its own particular way. The complete beauty of their streets depends on their harmony with the scenery in which they are set, and this close fellowship with the earth can only be accomplished by a use of local material, so that the walls raised by man's labour are one with the walls of rock or the seams of clay beneath the surface. A brick building in such a city as Bath, for instance, does not correlate with its environment; it is a thing in bad taste, however well proportioned in mass or delicate in detail. The same principle applies to an erection of stone in a brick country, though not with equal force, for the greater intrinsic beauty of stone compensates to a small degree for its want of relation with its surroundings. And so it is the use of local materials carried on through many generations, which produces local variations in style, variations which are far greater in colour than in form.

The distinctive character of such a town as Bradford-on-Avon is the result of using the stone that lies all round beneath the surface. The old church of the Saxons, the nine-arched bridge and its chapel

over the river, the great tithe barn, St. Lawrence's Church of the 15th century, and next the fine series of Elizabethan and Jacobean dwellings culminating in Duke's House, with its great windows and quaintly-cut parapet; then the several stately and rhythmic fronts of Georgian times; all are bound into one fellowship of fair buildings, as having sprung from the common ground of the local quarry. The stone is neither monotonous nor vivid, but full of quiet change from light brown through green to grey, sufficiently soft to receive textures and to give a footing to lichen and moss.

It is colour which gives a town its look of home; of having grown in its position; of being the culmination of the landscape. It is colour which unites all its buildings of various times and styles into unity of character. It is colour which can bring us and our architecture into the stream of local tradition, into touch with a past which we must not allow to die.

(To be Concluded.)

Our Plates.

Sir Aston Webb, R.A., F.R.I.B.A., F.S.A., architect, so well known as to need no introduction to our readers, was born in London on May 22nd, 1849, and is the son of the late Mr. Edward Webb, engraver and water-colour painter. He was educated privately, and afterwards articled to Messrs. Banks and Barry, 1866. He became president of the Architectural Association, 1884, and president of the Royal Institute of British Architects, 1902-4; receiving the Royal Gold Medal for England in 1906, and the Royal Gold Medal of the American Society of Architects in 1907. Among his principal works are:—The architectural surroundings for the Victoria Memorial, London; new Government Buildings at east end of the Mall; the completion of the Victoria and Albert Museum, and the Royal College of Science, South Kensington; the Royal College of Science, Dublin; with Mr. T. M. Deane, R.H.A.; the Britannia Royal Naval College, and Sick Quarters, Dartmouth; the restoration of St. Bartholomew the Great, E.C.; the French Protestant Church, Soho, and other churches; and many mansions, infirmaries, and commercial buildings. In conjunction with Mr. E. Ingress Bell, he has been architect for the Victoria Courts and the new University, Birmingham; new schools, Christ's Hospital, Horsham; Royal United Service Institution, Whitehall; Metropolitan Assurance Society Offices, etc. Sir Aston Webb became an A.R.A. in 1899, and an Academician in 1903, receiving the honour of knighthood in 1904. He is chairman of the Board of Architectural Education.

Mr. C. H. Barnsley, of the firm of Messrs. John Barnsley and Sons, Birmingham, is the grandson of the Mr. John Barnsley, who founded the firm some 70 years ago. He represents with his cousin Lieut.-Col. John Barnsley, J.P., the third generation in this business. Mr. Barnsley was educated at King Edward's School, Birmingham. On entering the firm's works he was at first relegated to the carpenters' shop, and he has therefore a wide knowledge of the active and practical side of the building trade. For three years he was President of the Birmingham Master Builders' Association, and represented this organisation on the Council of the National Association of Master Builders, now the National Federation of Building Trade Employers, in which body Mr. Barnsley has held the offices of auditor, treasurer, vice-president, and now of president. Mr. Barnsley was also president in 1904 of the Institute of Builders, and in 1903 he was president of the Midland Centre of the National Federation.

Among the more important works which he has personally superintended for his firm are the Birmingham Council House and Municipal Art Gallery; the new General Hospital, Birmingham; the Drapers' Hall, London; alterations and extensions to the Grand Hotel, Birmingham; Christ Church Buildings, Birmingham; Midland Hotel, Birmingham; Almshouses and villas at Bourneville; Ansell's Brewery; development of estate at Edgbaston and Lightwoods; Birmingham School Board Work; "Highbury," Moor Green, the home of the Right Hon. Joseph Chamberlain, M.P.; work for the Birmingham Water Department; Metropolitan Bank, Birmingham; Lewis's Premises, Birmingham; Birmingham Conservative Club; extensions at Rubery Asylum; St. Luke's Church, Birmingham; Britannic Assurance Co.'s new premises, Birmingham; Parrs Bank, Birmingham, etc.

Mr. Wilfred Barnsley, son of Mr. C. H. Barnsley, and Mr. Gordon Barnsley, B.A., son of Lieut.-Col. Barnsley, having recently entered the business, the firm can now boast of four generations in the course of its long and prosperous career.

Competition Notes.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Dec. 31	*CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50, £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council, Bodmin. Deposit. £1 1s.
1909 Mar. 17	NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3,500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council. Stanley S.O., Co. Durham.
No date.	†SOUTH BANK-IN-NORMANBY. Town Hall, Council Offices, etc., for the Urban District Council.
No date.	SWINTON. New Schools in Cromwell Road for the Swinton and Pendlebury U.D.C. Limited to Architects having offices within ten miles of Manchester. Premiums of £50, £25, and £10. Instructions may be obtained by letter on or before November 5th, to W. T. Postlethwaite, Council Offices, Swinton, Manchester.
No date.	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesborough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.

** This competition has been unfavourably reported upon by Correspondents.*

†The R.I.B.A. Council has requested Members to refrain from competing.

A gift of £1,000 has been made towards the cost of a new organ for the restored choir of Selby Abbey, on condition that the organ is to be constructed by a firm of eminent builders, is erected near the singers, and is not allowed to interfere with the architecture of the choir. Messrs. Hill, of London, have been chosen as the builders.

THE NEW GOVERNMENT BUILDINGS IN JAMAICA

A considerable amount of work in armoured concrete is now being carried out at Kingston, Jamaica. The illustration which we here give shows the new Public Buildings, containing the General Post Office and the Treasury, which are now in course of construction. The new building in the foreground of the view shows the King's House, a new residence for the Governor.

The architects and designers are Messrs. Nicholson and Corlette, of London, and the execution of the work has been placed in the hands of Messrs. W. Cowlin and Son, of Bristol, who are specialists in armoured concrete and licensees of the Coignet system, which has been extensively used by them, and which has been adopted for these buildings.

In getting out the design consideration has been taken of the danger from earthquakes, and the foundations of the buildings are constructed in such a way as to offer the least possible obstruction to the shocks or movement of the ground. The structures are practically erected on rafts containing a strong reinforcement of bars. The buildings are to be of the type which is usually adopted in hot climates, and they will be surrounded by verandahs. The columns supporting these are to be in concrete. The roof will be a flat terrace, over which will be spread several inches of gravel.

In order to give a brief idea of the construction, we may state that the pillars, which are to be square, will contain four or eight longitudinal bars, according to their position, with a diameter of about 1 in. These bars will be arranged in a symmetrical manner, and bound round by wire ties throughout the length of the column. The principal beams, supported by the columns, will be of a rectangular section, and will contain several straight bars of a diameter of about ¾ in. in the bottom or tensile part of the beams there will also be a corresponding number of bars of smaller section in the upper part of these beams. Both these members will be bound together by wire stirrups in order to resist shearing efforts. The smaller beams will be made in a similar manner. The slabs will contain a meshwork of bars of small diameter placed in the bottom part of the slab in order to resist tensile efforts. There will also be a large quantity of rods, which are to act as bracings connecting the various frameworks of the columns, beams and slabs in such a manner as to ensure a perfectly monolithic structure.

The scantlings of the posts will vary between 24 in. by 24 in. an 18 in. by 18 in., and some of them are to be octagonal. The scantlings of the principal beams will be 12 in. by 24in., with an average span of about 20 ft., and the secondary beams will have a scantling of 7 in. by 12 in. The average thickness of the slab will be 4 in.

The various staircases and balconies are also to be made in armoured concrete.

The twelfth congress of Russian cement manufacturers is to be held at Moscow instead of St. Petersburg as hitherto, eighty per cent. of the members belonging to Moscow. There will be a special section for the consideration of reinforced concrete.

OBAN NEW POST OFFICE.

Summer visitors to Oban have often been struck by the meanness of the Post Office accommodation, a department hitherto housed in a one-storey building, more fitted for a new mining camp out West or a Rand shanty than for the transaction of business in a summer resort of the age and pretensions of Oban. This reproach is now being removed by the erection of a new building on a piece of ground adjoining the Municipal Offices. The new building will have a frontage to both Albany and Shore Streets, each 82 ft. long, and will be two storeys in height. Access will be obtained from Albany Street to the public office, the postmaster's room, the engineer's office, the boys' bicycle room, etc., all of which are on the ground floor.

The public office will be 25½ft. wide, fronting the street, and will have a depth of 35 ft. to the rear. It will be 13 ft. high and lighted by a four-light mullioned window.

There being a natural fall of the ground from Albany Street, the top floor of the Shore Street block is on the same level as the street floor of the Albany Street block. On this floor is placed the postmen's and clerks' retiring rooms, linemen's and mechanics' room, stationery stores, etc. On the floor below will be the heating chamber and engineer's store; also a covered loading platform, to which access is obtained from an open yard off Store Street. An electric lift will connect the loading platform with the sorting office

The whole building is being constructed on modern fire-resisting and hygienic principles. The elevation to Albany Street will be faced with local granite rubble from Ballachulish, with Giffnock sandstone dressings. The side and rear walls will be finished in rough-cast or harling, and the edifice will be roofed with stone slates throughout.

The cost of the building is estimated at £9,650. The architect is Mr. W. T. Oldrieve, F.R.I.B.A., H.M. Principal Architect for Scotland, to whom we are indebted for the perspective drawing which appears on this page. The contract is in the hands of Mr. Hugh Macdougall, a local builder and contractor, and the clerk of works is Mr. R. Bland.

MONOCRETE CONSTRUCTION.

The application of concrete (plain and reinforced) has taken a big forward step during the past year. The advent of "Monocrete" is likely to still further enhance its possibilities, and the simplicity of the method and apparatus should enable it to play a still greater part in the buildings of the future. The "Monocrete machines, which were exhibited for the first time at the Franco-British Exhibition of last year, are designed to build walls and buildings of any kind entirely without the hitherto inevitable forms. The necessity of forms and shoring for concrete work while it is setting has been a great drawback to its employment as an outside structural material; also the length of time lost in waiting for the forms to be removed has been a material factor in its making slower progress than its value as a suitable material warrants. The introduction of the Monocrete machine should prove a boon to the contractor and investor. The cheapness of construction in this method should go far to prove its importance in the near future. With Portland cement at usual rates, and sand, gravel, or suitable aggregate at reasonable prices, building in concrete by the aid of the Monocrete machine can be done at a less rate than the same cubical capacity in ordinary brickwork. The question of housing (especially that of the working classes) may therefore be placed on a satisfactory basis, more especially as the cost of plastering is reduced to a minimum.

The cost of installing a suitable sized plant is one that concerns the builder's interest, and the fact that the "small" man can take up one unit and add to it as occasion may arise is a helpful factor. The success of the system is guaranteed by the fact that the International Jury of the Franco-British Exhibition awarded the machine two silver and bronze medals. The "Colonial" type of machine is being purchased by the British Government, and they are in use on railways in Lagos in Western Africa. It is also stated that important progress has been made in fixing agencies in Australia, New Zealand, India, Ceylon, Argentine, Canada, and, in fact, in all parts of the world.

LONDON SUBURBS.

2.—Ealing.

The growth of London since the railway era is so vast and so arbitrary that it is sometimes difficult to say how much is London, how much is suburb, and how much suburban town. Between Ealing and western London there is some break, and the associations and appearance of the place are very much those of a flourishing town in business on its own account. Yet London pervades it; London is close by, and people whose business and whose pleasure are mainly in London are its chief support. Though built well out on the great plain of Middlesex, it does not suffer from the usual reproach of "flat" neighbourhoods, and its first aspect to a visitor emerging from the Broadway Station is exceedingly attractive, and this mainly from the fact that it is so exceptionally well provided not only with greens. parks. and open spaces, but with well-grown and leafy trees. It possesses, moreover, within its bounds some old mansions in well-timbered grounds, built in the days when no question had yet arisen of whether it were "in the country."

Compared with more than one place at a similar distance from London, it has an air of lightness, and its shops and buildings bear testimony to the growing importance of the suburban town in the economy of modern life. "Shopping" in the suburbs is, indeed, largely affecting their architecture: altogether Ealing is a pleasant and rising place. Its older houses, generally fronting upon green sward and trees, are mainly of the Georgian time; its modern ones exhibit a great deal of Tudor and other "revived" styles, often very pretty and only falling short of being successful from their builders not having revived enough; the newest exhibit, that combination of red and white which seems now to be a sort of national livery. Among these may be mentioned the building estate, practically constituting a new quarter, of the Ealing Tenants' Association, founded and flourishing upon the principle of "co-partnership." Here we find "town planning" altogether a pretty township, whose founders look forward to much social gathering among its tenants, and have provided a hall for the purpose. In the older parts, however, of the place older methods prevail. The English are slow to adopt changes, and all domestic building art must still be based upon the separation of classes.

Several fine churches enliven Ealing: the Parish Church, the design of the late Mr. Teulon in his well-known French style; All Saints', by Mr. W. A. Pite, a church in memory of Spencer Perceval, the Prime Minister who was assassinated in the lobby of the House of Commons in 1812; and Christ Church, whose very high tower and spire are almost enough by themselves to give us its designer, Sir George Gilbert Scott. It is hardly possible to over-state the influence of his designs in the days of the "revival" upon church building and re-building in town and country.

The Parish Church exhibits Mr. Teulon at his best; it is full of character, though foreign in appearance, apsidal, with a "narthex" porch, round arched with a little "plate tracery" of the earliest stage of Gothic, and has a very stately tower of a kind seldom seen in this country—not higher, indeed, than our East Anglian perpendicular towers, but in harmony with the building; the whole in brown brick, with stone detail.

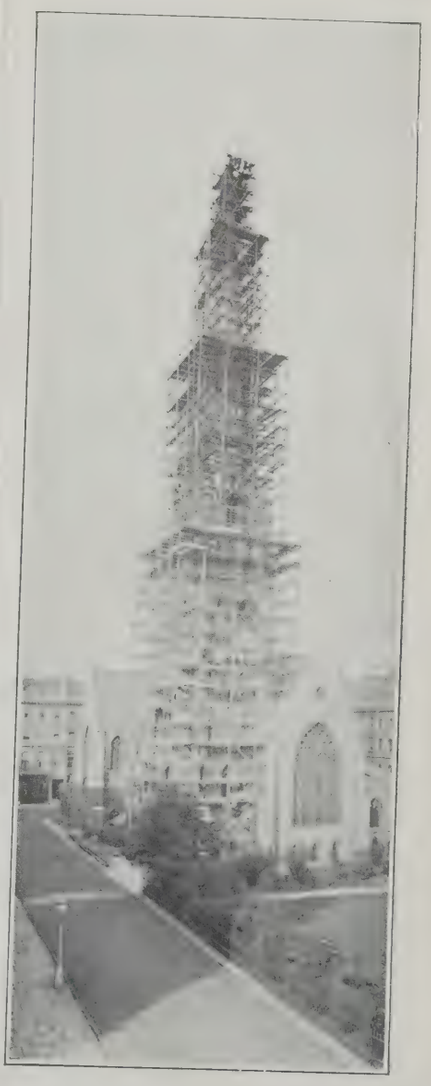
In Ealing we find every variety of villa building and every known style, all set in gardens, trees, and parks, and if the whole effect, though agreeable, be a little confusing, it only confirms the idea that English suburbs will grow in their own way like English things generally. The more recent shops and restaurants are on a scale unknown until a few years ago, except in the principal London thoroughfares, and it may be said of Ealing that it exhibits suburban life at its best, and much that is satisfactory in building, even if the long-promised style which is to satisfy all modern wants assumes almost as many forms as there are roads in the parish.

SCAFFOLDING AS THE NEW ART.

By A. G. H. Thatcher.

It has long been a reproach levelled against even our most creative architects that in the practice of their profession it is impossible to credit them with an idea entirely new.

Assuming this to be true, and it would indeed be a bold man who attempted to prove otherwise, it is difficult to define the cause. To an exhaustive training in a rigid school of thought may perhaps be assigned a considerable share of the blame, the inventive faculties being dulled by the immense field of erudition which has to be traversed by those who aspire to be leaders in one section of the artistic world. In this respect, no doubt, the ancients had an advantage. Untrammelled by what had gone before, all possibilities were before them, and were used as opportunity offered. To that must be added a power to see and mentally seize the beautiful in any shape, and to so adapt their impressions to actual purposes as to leave behind as a legacy to those following the magnificently realised conceptions which form a text for the art teachers of to-day.



As an instance may be mentioned the origin of the Corinthian capital. A decayed basket upon the broken tombstone and the acanthus leaf issuing between the defective strands. Surely, a simple object, but when modelled in the imperishable marble, how perfect. It is perhaps here that a hint may be given to those aspiring to emulate the genius of the past. How very probable it is that, blinded by the harmonious symmetries put before them as the highest of human ideals, the natural beauties of lowly life are entirely lost sight of.

Allowing this to be true, it will be well, perhaps, if eyes are turned in the directions mentioned, for surely even if the designs of nature are exhausted the humble examples of everyday life and work may afford those seeking, a suggestion which only waits the inspiring touch of the divine afflatus to transform it into a glorious subject for future admiration.

It is, however, easy to moralise; it is more difficult to show the way. But, nevertheless, a change of recent years which is worthy of study may give a lead to those concerned in the matter. It must be impossible, even to those only ordinarily observant, not to have been attracted by the great development in the art of scaffolding. Within easy recollection—and this is especially true of that type of scaffolding known as the gantry—the old, ill-fashioned designs have given way to erections symmetrical and even graceful in their proportions. The rough standard supporting the overhead platform has now become, in many instances, a pier with cap and base. The platform itself, if not surrounded with balusters of ornamental design, is supplied with a balustrade which in its simplicity conveys an artistic idea. Some examples, in fact, are to the forefront with features that outrival the freedom of treatment, both of line and colour, so regularly seen at Earl's Court. That this movement is one that commands public interest cannot be gainsaid.

Who is there who has seen a Cockney admiring Westminster Abbey? Yet let a Scotch derrick swing its mighty arm across the footway to uncoil its slender tentacle and gracefully carry the object seized into aerial realms, and a crowd collects at once. One word of warning may perhaps be given. Colour does not necessarily add to the beauties of scaffolding. Outline is more than paint.

Queer shades of green and yellow are not yet appreciated. It is true the Greeks painted their marble buildings, and although such an evidence of taste may possibly revive in the modern world, the time is not yet. Something must be allowed for present feeling. Besides,

SCAFFOLDING AT CHRIST CHURCH, LANCASTER GATE, LONDON.

fumed oak is a nearer approach to less artistically treated nature, and this effect can be as easily gained by a brush.

Scaffolding has no doubt been long despised as being only a means to an end. It has no written history, although it must have existed from the earliest times. Although no certain knowledge is obtainable as to the means by which the ancients erected their buildings, it may be taken for granted that when pre-historic man propped the roof of his cave dwelling with a tree trunk, he showed a knowledge of shoring which is allied to scaffolding, and proves that these arts are of extremely early origin.

It is almost a pity that scaffolding on the whole is so impermanent. True, the scaffolding in the west front of St. Paul's Cathedral seems to belie this. If it cannot now be said that it has been in existence from time immemorial, it is only a question of time when such will be true. To the trained eye of the scaffolder, the beauties of his work are manifest. He cares nothing for the building. His pride is in its temporary clothing, and his regret must be intense when he sees his best efforts ruthlessly demolished. Perhaps after these few hints an inspired genius may, by judicious selection, give its principal beauties a permanent form. A capital designed upon an arrangement of

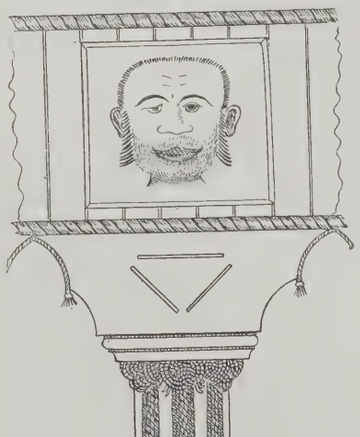


FIG. 1.

cordage and knots, as Fig. 1, would rival the Corinthian in simplicity of origin. The decayed ox skull again in the Doric order may be beautiful to the depraved taste, but who would not admit that an idealised representation of the human race would appeal more to those of finer feelings. Who knows; such a design may confer honour on the creative artist by being named after him (and when I think of this I almost wish I hadn't signed this article).

In conclusion, may one word of caution be added. Let the aspiring designer who may be induced by these notes to tempt fame and, doubtless, fortune, be careful, for in common with most of his kind he will most assuredly be laughed at.

Ingleby Chase, near Lincoln, the residence of Mr. William Mortimer, has recently had all the flues mounted with the "Edwardian" chimney-pot.

LABOUR STATISTICS.

From the just issued Board of Trade twelfth Abstract of Labour Statistics referring to the year 1906-7, the following notes are taken as being of some interest to the building trade.

FLUCTUATIONS IN EMPLOYMENT.

Considering industries as a whole, it appears that, taking the year 1900 as represented by the index number 100, there was a gradual fall in the amount of employment in each subsequent year down to 1904, when the index number stood at 95.9 as compared with the year 1900. Since then a gradual rise has taken place until 1906, when it stood at 98.7; the year 1907, however, shows a slight decline to 98.5. This seems a small difference to be the cause of so much unemployment as is reported. A glance at the tables giving the percentages of unemployed, as returned by the Trades Unions for important groups of trades, shows however, that certain groups are suffering much more than others, so that the broad average is misleading to some extent. For instance in the building trades the returns of only two branches—viz., carpenters and plumbers, shows that while the percentage of unemployed in 1900 was only 25 per cent. it has continued to increase steadily in each succeeding year until 1905, when it reached 8.3 per cent., in 1906 it fell to 7.2 per cent. and in 1907 to 6.7 per cent., which gives some indication that the building trade has turned the corner of depression, and is quietly getting to work again. Another instance is the shipbuilding trades, where in 1900 the percentage of unemployed was also 2½ per cent., but by 1903 this had risen to 12 per cent., and touched high-water mark in 1904 with 14 per cent. of unemployed. An improvement has since taken place, but the percentage is still high, in 1907 viz. 9.2 per cent.

PRODUCTION.

Inhabited Houses.

According to the reports of the Inland Revenue Commissioners there were in the United Kingdom in 1900, 42,518 separate dwellings, 28,470 hospitals, schools, and royal or diplomatic residences, and 544,428 houses solely used for trade, making a total of 615,416. In 1907 the corresponding figures were 79,393 separate dwellings, 33,509 hospitals, etc., etc., and 650,256 houses used for trade solely; total 763,158, showing a total increase in seven years of 147,742 buildings. As bearing on the depression which has prevailed in the building trade during recent years, the following facts may be noted. Dealing first with separate dwellings in 1900, they numbered 42,518, and rose in 1901 to 45,250, but fell in 1902 to 34,175; by 1904 they had again risen to 45,491, but in 1905 they jumped up to 68,487, and in 1906 to 73,873, and even in 1907 there was a substantial increase to 79,393, their present figure.

Hospitals, schools, etc., do not show so much fluctuation, the number in 1900, 28,470, remaining nearly stationary until 1903, when it rose to 30,230, but fell again next year to about the old figure, in 1905 and 1906 and 1907 a distinct advance was made to its present figure of 33,509. Houses used solely for trade which in 1900 were 544,428, increased gradually year by year until in 1905 they stood at 607,041, but jumped up to 634,031 in 1906, and again to 650,256 in 1907. In the face of the great depression in building which has prevailed since 1904, these figues seem remarkable. It would seem that in the latter years the new buildings which had kept the trade occupied down to 1904 and 5 only became liable for assessment by the Inland Revenue in the years 1905, 6, and 7. It seems clear, however, that the depression represents a natural reaction to some extent from the boom which caused the large increases shown above.

Changes in the Rates of Wages.

Considering the building trade only it appears that taking the year 1900 as an index number of 100, the average rate of wages has not changed at all during the past seven years, and compared with any year from 1874 to the present time the wages during the period 1900 to 1907 are the highest on record in this industry.

In 1874, a boom period, the wages were represented by the index figure 81.11 showing that since that date they have been advanced nearly 25 per cent. The rise has been gradual and pretty continuous.

Changes in Hours of Labour.

Hours of labour have shown likewise a considerable decrease; from 1900 to 1907 inclusive the total number of hours of labour remitted to the work people per week in the building trade alone amounts to 91,071 or over 4,750,000 hours per annum. Taking the above facts into consideration it is evident that the work people in this industry have been liberally dealt with by their employers.

Cost of Living.

It must however be remarked that the cost of living during the same period has somewhat increased; for example, bread, the mean average cost of the 4 lb. loaf having advanced from 4.99d. in 1900 to 5.48d. in 1907. Meat, fish and dairy produce also show an increase of about 4½ per cent., but sugar, tea, wine and tobacco show a decrease of 5.6 per cent. for the same period.

Trade Disputes.

Show as regards the building trade a marked decline in severity for the last two years as shown by their duration in number in working days. In 1905 412,683 working days were lost by trade disputes in this industry, whereas in 1906 only 56,201, and in 1907 23,128 days were lost, these being the lowest figures since 1893. The next lowest figure was in 190 when 114,371 days were lost and the highest figure occurred in 1896 when the loss was 1,060,227 working days.

As showing the growing resort to Conciliation Boards for a settlement of disputes, the number of cases considered b Boards has increased since 1900 from 2 to 58, while the number of cases settle by Boards in the same period has increased from 23 to 47. The number Boards that dealt with cases was 28, an the number which settled cases 20.

Summary of Occupations.

The tables under this head gives th number of persons occupied in buildin and works of construction for the year 1881, 1891, and 1901.

For the United Kingdom the numbe were 1881, 926,135; for 1891, 955,57 and for 1901, 1,335,820, thus making th building the seventh largest employin industry in the Kingdom.

Associations of Employees.

The total number of Master Builde Associations is given as 161, probabl however, many of these are only Ass ciations in name, and display no activi at present.

There apears to be a considera number of sectional trade Associatio like Bricklayers, Masons, Plumbers, et totalling in all 134, in addition to t Master Builders' Associations.

Trades Unions in the Building Trade.

The number of labourers' trades unions at end of 1906 is given as 41 (showing a decline since 1900 when they numbered 56), with a membership of 15,932. The number of other unions is given as 55 (showing a decline since 1900 from 75), with a total membership of 180,404. Their average accumulated funds per member is rather over £2. Their contributions in 1906 were about £2 10s., and their expenditure about £2 8s. per member.

The conclusions which may be drawn from the foregoing facts indicate that there is good ground for hope that a period of prosperity is at hand for the building trade; they show that the employers have dealt generously with their workpeople through the hard times by not demanding substantial reductions of wages; and that on the present level of wages and cost of living the workpeople are as well off as ever they were.

The publication of tenders was the subject of a special resolution at a recent meeting of the Kingston (Surrey) Board of Guardians. It was moved, and unanimously carried, that in future the principal quotations of accepted tenders should be published through the usual channels. Surely such a motion ought not to have been necessary; for, as the mover pointed out, the course advocated is everywhere common.

OLD ST. PAUL'S.

This view of the old cathedral, taken from an ⅛ scale model executed by Mr. John B. Thorp, shows the South front as it appeared about the middle of the 16th century. The church was begun after the first great fire in 1136, and the style of architecture ranged from Early Norman to Early English Gothic and Decorated; the nave being the first portion that was built was Norman, against this at the south-west corner was erected the parish church of St. Gregory, also Norman. The spire, probably the tallest in Europe, rose 520ft. above the pavement; it was finished in 1498, and was burnt down in 1561, the fire being caused by lightning in a great storm; this theory, although probably correct, was afterwards disputed, as a plumber a few years later confessed that he upset a pan of coals while repairing the roof. The choir was of pointed architecture, and was finished in 1255, this addition necessitated the removal of the parish church of St. Faith, which was then on the site, but the parishoners were given a place of worship under the choir. The Chapter House was on the west side of the south transept, and when the churchyard was being laid out a few years ago, portions of the foundations of this building as well as those of the cloisters were unearthed. After the spire was destroyed, Queen Elizabeth gave orders for the damage to be repaired. The restoration appears to have been very improperly done, for in 1620 James the First appointed Inigo Jones as architect, but he, knowing little or nothing about Gothic, endeavoured to turn the church into a classic building, adding a very fine Italian Portico to the west front.

In May, 1666, Christopher Wren drew up a report for renovating the cathedral, but in the Great Fire which commenced on September 2nd of that year, the whole building was burnt to the ground.

BUILDERS' WINCHES.

As an aid to expeditious building, the patent winches of Messrs. G. Stacey and Co. seem to be coming more and more into favour.

They have been used by Messrs. Stuart's on works at Hull, Greenhithe, Leeds, and London, where on one building, viz., the Waldorf Hotel, material was raised to a height of over 100ft.

Two winches were also used on the Manchester Royal Infirmary to hoist the material for the floors constructed by the National Fire-proofing Company, and, among many other jobs, may be mentioned Long Grove Asylum, where they were used to hoist material to the extent of 24,000 yards super, and new offices at 81, Bishopsgate Street, where the material hoisted comprised some 6,000 yards super of gauged concrete.

OLD ST. PAUL'S: FROM A MODEL BY JOHN B. THORP EXHIBITED AT THE FRANCO-BRITISH EXHIBITION.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters

The querist's name and address must always be given, not necessarily for publication.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Setting Out Handrails.

HUDDERSFIELD.—CONIC writes: "Will you give me the method of setting out the handrail twist shown on plan (not reproduced); also could you recommend a good book on handrail ramps?"

The subject of handrail wreaths cannot be briefly expounded, and is already exhaustively treated in several excellent text books, including:—"Modern Practical Joinery," by George Ellis, B. T. Batsford, 94, High Holborn, 12s. 6d. net; "Stair-building and Handrailing," by Wm. and Alexander Mowat (published at 28s., but offered at some reduction). "Handrailing and Staircasing," by F. O. Creswell, 3s. nett; "Stair-building in its various forms," by J. H. Monkton, 17s. nett; Riddell's "Carpenter, Joiner, Stair-builder, and Handrailer," with a series of cardboard models of wreaths (published 45s., now obtainable second-hand at about half-price). It may be said that the extremely narrow well in the example shown will not make a satisfactory wreath—it is impracticable, as the hand of the user runs a risk of getting wedged in the narrow trim.

Noise from Gas Engine.

CREWE.—J. R. writes: "Would you kindly let me know the cheapest and best method of deadening the sound from a gas engine in a room over the engine house? There are concerts, public meetings, etc., held in this room, and the noise of the engine is objectionable. There is only a boarded floor over, not ceiled on the under side. I had thought of boarding the underside of joist over the engine house and filling in between with sawdust. Would this be satisfactory, or what is the best and simplest way of effectually stopping the sound in the room?"

No doubt you have already asked the engineers whether the engine is silenced so far as is practicable. I rather doubt if it be possible to entirely deaden the sound of the running, and feel sure that some vibration will be felt in the room above whatever you may do to the floor. The usual medium for filling in the space between the floor joists in such a case is silicate cotton (which is fireproof), or coarse stuff mixed with chopped hay may be employed—sawdust is not so good, and has also a tendency to bleed out should the sheathing boards shrink. F.S.I.

Trespass.

ASHTON-ON-MERSEY.—A writes: "I own the house marked A in plan enclosed (not reproduced), B owns house adjoining marked B; the division between the two gardens is a paling about 7ft. high, owned and erected by B. B asked to be allowed to come on to my land to tar my side of his boards, and I asked him to leave it over until we had amicably come to terms over a large hoarding he threatened to erect; he, however, refused (but offered acknowledgment as to this), and tarred the boards by sitting astride the fence and painting the palings with a long brush. He afterwards erected his hoarding and tarred that in a similar manner. Is not the fact of hanging over my land in this manner a trespass, especially as a fairly large quantity of tar was deposited on my land in the process (extending an average of 2ft. wide), and my dog got tar on his feet and brought it into the house on to the carpets. Is B not liable also for this damage? B's palings in one place overhang eight or nine inches; cannot I compel him to alter this? Still another point. B has a very large oak tree in his garden, as shown, two very large branches of which overhang my land, one being in close proximity to the roof, which it may damage, and the other hanging as it does over the front door entrance is a nuisance with its drippings; the leaves also are liable to stop up my gutters and drain-pipes. I have written to B (who has ignored my letter) asking him to cut off the oak tree branches, straighten his palings, and also pointing out the trespass and damage complained of. Do you think I can legally compel him to do as requested and also obtain damages and costs if compelled to go to court? B has been extremely vindictive and unpleasant in every possible way, hence my reason for pressing these matters."

As relations have apparently become very strained between yourself and your neighbour, I advise you to carefully consider the expediency of taking any action at all in the matters you enumerate. Are they really unbearable?

Dealing with each point as you name it, I am of opinion:—

That though "B" no doubt committed a technical trespass in hanging over his fence in the way he did, it is not such a trespass as would carry damages in a court of law. It seems a pity you refused the permission asked for.

That the damage done to the carpets by your dog is not such as can be claimed for from "B," though, of course, it was indirectly due to his operations.

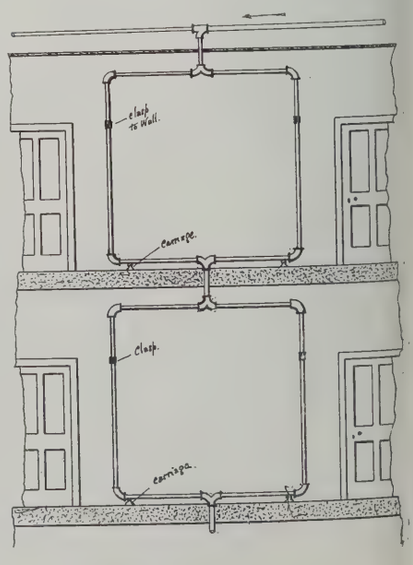
That the overhanging palings are, in fact, an encroachment on your property is a matter of evidence, but if they can be shown to overhang, even to the small extent you mention, you have a legal right to have so much of the fence as forms an encroachment removed.

That the limits of the oak tree, so far as they are over your land form an encroachment, and that you are legally entitled to their removal; if after reasonable notice to remove them, "B" neglects to do so, you are justified in cutting them back to your boundary line (not further), doing the cutting in a workmanlike way and with as little damage to "A's" tree and other property as possible.

Finally, I advise you to employ a solicitor to communicate with "B," before you do anything more. It is easier to get into a legal action than to stop proceedings when once commenced, and it is very easy for you to take some wrong step if you deal with this matter personally. You have not, I believe, suffered anything which would secure you costs and damages in a Court of Law, and it appears to me—as a looker-on—that "the game is not worth the candle." You do not say what the hoarding consists of, but from your plan I conclude that it is entirely upon "B's" own land, and has been probably erected by him to prevent your acquiring a right of light over his property. This he is, of course, justified in doing if your windows are less than twenty years old, and if you wish to have a light out in that direction, the acknowledgment rental should be paid by yourself and not by him!

F.S.I.

Architectural Lantern Slides.



INVERNESS.—T. SQUARE writes: "Is it possible to obtain anywhere, either by hire or purchase, a set of lantern slides to illustrate a paper on early British domestic architecture — say, from the Roman invasion to the Tudor period—on the lines of Parker and Turner's 'Domestic Architecture'?"

We do not know of any collection of slides showing work during the period mentioned. Indeed, the examples of such domestic work now remaining are so few that it would involve considerable time and labour to collect photographs of authentic work. Perhaps some of our readers can help "T. Square."

Condensation in Buildings.

BIRMINGHAM.—H. H. H. writes: "Can you or your readers suggest an explanation and remedy for the excessive condensation frequently saturating many well-arranged modern buildings? Some premises and offices I know consist of a first-class five storey block with well-ventilated corridor to each floor and served with a lift. The floors are of concrete, paved with marble and mosaic. The walls are well painted and oak panelled, but although the buiding was completed some six or seven years ago it frequently happens that in cold, muggy weather, damp collects on the walls of the corridors and staircase, runs down the walls, carrying paint along with it, collecting in pool on the corridors and staircase, and then running down the staircase in a stream. The outside walls are of white glazed bricks, and it has been suggested that this fact has been a contributary cause. Is there any practical remedy?"

The cause of the condensation is the fact that the walls and floors cool slowly during the autumn to a temperature that at last is lower than the dew-point of the moisture in the air; and then condensation begins. Plastered walls absorb the condensed vapour to some extent, and porous bricks allow it to be dried out during the next spell of warmer weather. In your building, the non-absorbent tiles and polished wood prevent the absorp-

tion, and the non-porous glazed bricks prevent the drying. The cure for the water trickle and pools is warmed walls, and copious ventilation with warmed air. Perhaps the cheapest way to do this well will be to fix an hot-air apparatus in the basement and lead from it two or three large pipes to gratings in the ground floor corridor. The movement of the lift will then suck and drive the air along the corridors, and if the rooms have fires, these will draw in warm air and aid its distribution. If this prove insufficient for a five-storey building, hot-water pipes can be installed, either high or low pressure, though the accompanying sketch shows low pressure. Pipes are better than radiators, as the heat is more spread out, and they supply more genuine radiation to ceiling, wall, and floor. They may be rather larger on the ground and first floors, to compensate for the cooler water within them, though the hot-air apparatus, when installed, annuls such need. The pipes can follow any line of cornice or wall decoration on the tile dado, and will yield most heat when painted black. They must be strongly clasped to the walls, to prevent damage. The hot-air apparatus will need cleaning doors to its chamber and pipes, to allow of the removal of the smuts and dust that collect in a large manufacturing town. INGENIOR.

Building Stones in New Zealand.

BARNSLEY.—G. W. S. writes: "I am requiring information for the erection of a memorial cross at Auckland, New Zealand. Kindly give the particulars of the suitability, colour, and names of the stones or marble quarried in the Islands. Also the suitability of Sicilian marble for the climate and comparison of cost with native material, if the work was executed here and sent out."

The following particulars have been furnished to us by the High Commissioner for New Zealand, which I trust will serve your purpose:—

Extract from Handbook of New Zealand by James Hector, M.D., C.M.G., F.R.S.:—

"Marble.—The purest form of this series is found in many localities in the South Island; statuary marble occurs among the gneiss and hornblende schists of the West Coast. The grain of most samples hitherto found is rather coarse, but closer-grained kinds exist in Caswell Sound, where a quarry has been opened, and also in the Mount Arthur district of Nelsen.

"Granular or crystalline and subcrystalline limestone of every shade and colour, texture and hardness, occur plentifully, chiefly in the South Island.

"Extensive masses of the harder compact kinds occur in the Upper Palaeozoic formations. They are, generally speaking, of a blue colour and unfossiliferous.

"One mass or stratum occurs in the slates of the Kakanui Range; it is several hundred feet thick, with an outcrop of five miles in length, and is probably the best in the district of Otago.

"A great variety of excellent limestone suitable for building stones might be obtained from the Horse Range (Shag Valley side); at Twelve-Mile Creek, on Lake Wakatipu; Malvern Hills, Canterbury; and Hokanui Hills, Southland. In the latter district, a very fine kind is obtainable, very slightly coloured, it belongs to the Cretaceotertiary series.

"A white granular limestone called the Oamaru stone is worked in extensive quarries in the Oamaru district; but it occupies a large tract of the country in the north part of Otago and throughout Canterbury, and has a remarkable uniformity of colour and texture; its weight, wet from the quarry, is 105lb. per cubic foot, and when perfectly dry 92lb. A considerable quantity has been exported to Melbourne.

"The principal buildings of Dunedin are built of this stone, which shows a very fair amount of durability.

"At Wairoa, Auckland, there is a good hard close-grained stone, of a light buff colour, mottled with black grains."

We are unable to answer our correspondent's second question. Perhaps a New Zealand reader will oblige.

THE ROYAL INSURANCE BUILDINGS, ST. JAMES'S, LONDON.

This structure was designed by Mr. John Belcher, A.R.A., to accommodate the West End Branch Office of the Royal Insurance Company, Limited, and their offices occupy the greater portion of the ground and mezzanine floors. As it occupies probably the most valuable site in the west end of London, the utilisation of all the availabe space was a primary object. It is therefore remarkabe for its strength and lightness of construction, as only the strongest and most durable materials have been used, and the smallest possible space taken up by walls and supports, thus utilising to the fullest extent the limited but extremely valuable site.

Pentelikon marble has been employed in the construction of the facades. The steel framework is carried up to the roof which is also of steel filled in with hollow bricks. The retaining wall to the basement and lower ground floor is of ferro-concrete, and extends to a depth of about thirty feet below the pavement. The building is carried on seven steel stanchions each carrying from 400 to 600 tons dead weight.

The window frames and casements on the ground and mezzanine floors are of bronze, and those on the upper floors are of steel. The dormers are also covered with bronze and the mansard roof with Westmoreland slates.

The whole structure is of the latest fire-resisting construction. The staircase and landings are of Roman Grey stone with a lining of statuary marble and Tinos capping.

The Company's public office on the ground floor and the Board room on the mezzanine floor are panelled with specially selected mahogany, wax polished, and all the metal fittings are of oxydised silver. The fourth floor has a loggia affording an uninterrupted view of both thoroughfares, and provision has also been made for viewing processions from this, and from the mezzanine floor, where bronze balconies have been provided. The sculptured figures at third floor level are by Mr. Bertram Mackennal, and the coat of arms painted on the angle by Mr. Alfred Drury, A.R.A

The general contractors for the building were Holloway Brothers (London), Ltd., the clerk of works being Mr. William Gunning. The following are some of the sub-contractors:—

Pentelikon marble: Marmor, Ltd. *Ferro-concrete, basement wall construction*: Empire Stone Co. *Steel construction and girders*: Edward Wood and Co., Ltd. *Fireproof floors and partitions*: "Kleine" Patent Fire-resisting Flooring Syndicate, Ltd. *Tiles*: Craven, Dunnill and Co. *Casements and casement fittings*: Crittall Manufacturing Co. *Grates, art metal work, electric light fixtures*: J. W. Singer and Sons. *Electric wiring, bells*: Donnison, Sillem and Co. *Marble flooring and marble work*: J. Whitehead and Sons. *Art metal work and electric light fixtures*: F. and C. Osler, Ltd.; and Spital and Clark. *Door furniture*: N. F. Ramsay and Co. *Railings*: W. T. Allen and Co. *Lifts*: A. Smith and Stevens. *Heating and ventilating*: J. R. Cooper and Sons. *Lightning conductors*: R. Anderson and Co. *Pump*: Langdon Davies Motor Co. *Pavement lights and fire-resisting glazing*: The British Luxfer Prism, Ltd. *White glazed "Shepwood" Patent Partition Bricks*: Leeds Fireclay Co., Ltd. *Plaster work and special woodwork*: Holloway Brothers.

THE ROYAL INSURANCE BUILDINGS, ST. JAMES'S, LONDON. INTERIOR OF THE GENERAL OFFICE. JOHN BELCHER, A.R.A., ARCHITECT.

SOME COMPETITIONS OF 1908.

Award Announced	Building.	Cost.	Assessor.	Successful Competitors.	Remarks.
		£			
January ..	Elementary School, Southport	—	S. E. T. Lawrence	1st (£50) Cheers & Smith; 2nd (£30) A. Brocklehurst; 3rd (£15) Charles Adshead.	68 designs submitted; limited to Lancashire architects
,,	Municipal Buildings, Hertford	—	———	1st (£50) Charles Carter; 2nd (£20) R. Palmer Baines ..	98 designs submitted
,,	Municipal Buildings, Stirling	—	William Leiper	1st (£50) Salmon & Son,& Gillespie; 2nd (£30) Stewart & Paterson; 3rd (£20) Alex. Wingate.	
,,	Secondary School, Sowerby Bridge ..	—	J. Vicars Edwards.. ..	1st, Longbottom Culpan; 2nd, R. Fielding Farrar ..	28 designs submitted
,,	Y.M.C.A. Building, Manchester	40,000	Thomas Worthington	Woodhouse, Corbett & Dean	4 firms of Manchester architects invited to submit designs
,,	County Hall, London (Final Competition)	850,000	Norman Shaw, W. E. Riley, & Sir Aston Webb.	Ralph Knott	Second and Final Competition.
February..	Castleton Branch Baths, Rochdale ..	—	A. Saxon Snell	1st, Wallis & Bowden; 2nd, Butterworth & Duncan; 3rd, P. W. Hathaway.	
March	Municipal Buildings, Acton	—	Norman Shaw	1st (100 guineas) Davis & Oglesby; 2nd (50 guineas) S. B. Gridley; 3rd (25 guineas) Mackintosh & Newman.	
,,	City Hall, Perth	25,000	J. J. Burnet	1st (£50) H. E. Clifford; 2nd (£30) Stewart & Paterson; 3rd (£20) Campbell Douglas, & A. N. Paterson.	136 designs submitted
,,	Royal Grammar School, Colchester ..	15,000	T. G. Jackson	1st, Newman, Jacques & Round; 2nd, Spalding & Spalding; 3rd, Goodey & Cressall.	17 designs submitted
,,	Town Hall, Radcliffe, Manchester.. ..	12,000	G. H. Willoughby	1st, W. M. Gillon; 2nd, D. Bird; 3rd, H. Lord; 4th, Gilling & Moorhouse.	54 designs submitted
April	Secondary School (County High School), Harwich.	6,500	Leonard Stokes	1st, Brown & Burgess; 2nd, Eade & Johns; 3rd, Bisshopp & Cautley.	13 designs submitted
,,	Municipal Offices, Conway	—	Porter and Elcock ..	F. D. Cheers	
,,	Two Estates, Warrington. Garden Suburbs	—	Segar Owen	A. & J. Souter	21 schemes submitted
,,	Technical College Extension, Sunderland..	—	A. W. S. Cross	1st, Brown & Spain; 2nd, Vaux & Marks	Competition limited to local architects
,,	Secondary School, Yeadon and Guiseley ..	—	———	1st (£35) W. M. Broadbent; 2nd (£20) Philip A. Robson	
,,	Elementary School, Bootle..	11,000	———	Crouch, Butler & Savage	149 designs submitted; school to accommodate 1,000 children
..	Day Training College, Dudley	—	———	Crouch, Butler & Savage	Competition limited to 30 selected architects
,,	Wesleyan Church and School, Feltham ..	5,000	———	Crouch, Butler & Savage	Selected from among five other invited designs
,,	Secondary School, Lowestoft	—	A. Morris Butler	1st, Brown & Burgess; 2nd, R. Scott Cockrill	School to accommodate 300 boys and girls
May ..	New Masonic Hall, Leicester	8,000	S. Perkins Pick	1st, H. H. Thomson; 2nd, W. M. Cowdell; 3rd, R. W. Bedingfield.	Limited competition
,,	High School for Girls, Stockport	11,000	J. W. Simpson	1st, Spalding & Spalding; 2nd, Cheers & Smith; 3rd, Applyard & Quiggin; 4th, G. H. Brady.	20 designs submitted
,,	Schools at Anerley	—	———	Cecil A. Sharp	Limited competition
,,	Enlargement of Banstead Downs Golf Club Premises.	—	———	Cecil A. Sharp	Limited competition
,,	Elementary School, Romford	—	———	Cecil A. Sharp, in conjunction with A. S. R. Ley	
June	Gardens of the Peace Palace at the Hague..	25,000	———	Thomas H. Mawson	Englishman, Dutchman and German invited to compete
,,	Council School, Kingsdown, Bristol ..	7,389	W. L. Bernard	W. S. Skinner	School to accommodate 500 scholars
,,	Plans of Farm Buildings	—	———	1st (£50) J. W. Hepton; 2nd (£25) Clark and Moscrop; 3rd (£15) Samuel Taylor and Son; 4th (£10) J. M. Holmes.	
,,	Church Buildings, Blackheath	—	Philip A. Robson	Wills & Anderson	Buildings for use as elementary school, etc.
July ..	New Hostel, Bangor College	25,000	———	Henry T. Hare	
	Homœopathic Cottage Hospital, Southport	—	R. Norman Shaw	1st, H. Percy Adams & C. Holden; 2nd, Briggs & Wolstenholme; 3rd, Haigh & Thompson.	
,,	Baptist Church and Schools, Leeds.. ..	8,500	W. H. Thorp	Percy Robinson & W. Alban Jones	Church to accommodate 500 persons
,,	Workhouse Extension, Islington	—	Lewis Solomon	Greenaway & Newberry	7 competitors
,,	Secondary School	—	———	Joseph Holt	
,,	Shrewsbury Public Hall and Institute, Andsell .	—	———	G. H. Willoughby	Competition limited to architects practising in Manchester, Blackburn, Lytham and St. Anne's
,,	Public Libraries, Rowley Regis	—	———	1st, Wills & Anderson; 2nd, Crouch, Butler & Savage ..	103 designs submitted by 99 competitors
,,	New Schools, at Eccles	—	———	1st, Henry Lord; 2nd, Charles Clegg & Son; 3rd, J. N. Fletcher.	
,,	Extension of Princess Alice's Hospital, Eastbourne.	—	A. Hessell Tiltman.. ..	W. Haythurray	
,,	Secondary School, Market Drayton ..	—	H. Beswick	Joseph Holt	98 designs submitted
,,	New Schools, Tebay	—	———	Sproat, Farmer & Warwick	About 50 designs submitted
,,	Extensions to St. Chad's Church, Leeds ..	—	H. C. Corlette	J. Harold Gibbons	Limited competition
August ..	New Schools, Tiverton	—	C. Harrison Townsend ..	1st, W. H. Ashford; 2nd, W. H. Atkell	231 designs submitted
,,	Infants' School, Cotteridge..	—	———	J. P. Osborne	
,,	New Schools in Grove Road, King's Heath, Birmingham.	—	———	Ewen Harper & Brother	
,,	Widening of Market Gate, Warrington ..	—	Prof. C. H. Reilly	1st & 3rd (£50) Wright, Garnett & Wright; 2nd, Wm. & Segar Owen; 4th, Mr. Beesley.	Final competition; 12 designs submitted
,,	Council Schools, Northenden, Sale.. ..	—	———	Magnall & Littlewoods	
,,	Emergency Hospital, Ilford	—	H. Percy Adams, F.R.I.B.A.	1st, Armstrong & Wright; 2nd, Ewen Harper & Bro.; 3rd, Chatterton & Couch.	54 designs submitted
,,	Restoration of St. George's Church, Bolton	7,000	Austin and Paley	1st, J. L. Simpson; 2nd, F. Freeman	
,,	Intermediate School for Boys, Cardiff ..	—	Leonard Stokes, F.R.I.B.A.	1st (£50) and 3rd (£30) Teather & Wilton; 2nd (£40) James & Morgan.	34 sets of plans submitted
,,	New Receiving and Vagrant Wards, Islington Workhouse, London.	Estimated at 3,350	Lewis Solomon	Two premiums (£15 & £10) Greenaway & Newberry ..	Another plan adopted
,,	Workhouse Extension, Dudley	—	C. E. Bateman, F.R.I.B.A.	Nicol & Nicol	Limited competition
September ..	Free Library, Ellesmere Port	—	J. Swarbrick, F.R.I.B.A...	Sproat & Warwick	Four architects entered competition
,,	New Grammar School, Malton	—	Paul Waterhouse, M.A., F.R.I.B.A.	1st, W. H. Bingley; 2nd (£10) Bottomley, Son & Welburn; 3rd, Clarke Moscrop & Feetham; 4th, C. H. Channon.	
,,	New Secondary School, Cleckheaton ..	—	Vickers Edwards	1st (£50) William H. Thorp, F.R.I.B.A.; and (£30) W. S. Braithwaite; 3rd (£20) R. Fielding Farrar.	64 sets of plans submitted
,,	Congregational Church House, Manchester	—	Paul Ogden, F.R.I.B.A. ..	1st, Bradshaw & Gass; 2nd, J. Gibbons & Sons; 3rd, J. & J. Swasbrick.	Many meritorious designs submitted
,,	Upper Standard School, Rotherham ..	12,000	E. R. Robson	1st (£50) David B. Jenkinson; 2nd (£20) James Totty ..	
October	"Daily Mail" Ideal Homes Competition..	500	E. L. Lutyens	1st (Gold Medal & £25) Arnold Mitchell	
,,	,, ,, ,, ...	750	———	Frank Bromhead	
,,	Swansea Cottage Homes' Site	—	Geo. T. Brown; Marcus Hoskins, H. Bedford Taylor; Raymond Unwin.	1st (Gold Medal) James Crossland; 2nd (Silver Medal) Gilbert Waterhouse; 3rd, John W. Aldiss.	
November	Secondary School for Girls, Brighouse ..	—	———	Sutcliffe & Sutcliffe	15 competitors
,,	Garden Designing, Letchworth	—	R. Hackness; Kelway and Sons; and Mawson Bros.	Class I: David Smith; Class 2: W. H. Johns; Class 3: 1st, M. & A. R. Wilson; 2nd, F. J. Landsell; Class 4: 1st, Cayley & Rochester; and, Miss L. A. Dunnington.	
December	Glamorgan County Hall, Cardiff	—	W. D. Caroe	1st, Harris & Moodie; 2nd, Pearson & Milburn; 3rd, Henry T. Hare.	198 designs submitted
,,	Poster for Building Exhibition, 1909 ..	—	Sir Aston Webb, R.A.; Sir George Frampton, R.A.; Ernest George, P.R.I.B.A.	Geo. Denham	Promoted by H. Grevill Montgomery, M.P., 20 designs submitted
,,	New Baths and Pump Room, Bakewell	—	———	1st (£25) Boyden & Walton

THE SAXON CHAPEL OF ST. LAURENCE, BRADFORD-ON-AVON.

ENGLISH MEDIÆVAL ARCHITECTURE.

By EDWARD S. PRIOR.

The Roman building left in the British Isles has nothing above ground of importance besides what many provincial cities in France, Germany, and Spain have; on the other hand, England may be envied for the record of VIIth to Xth century art that appears in Anglian and Viking (Keltic) crosses, many of them elaborately sculptured. There remain over a hundred stones which show this art in the north and west of England, besides many in Wales, South Scotland, and Ireland. The church building of the Saxons is also left to us in an architecture which can in many instances be confidently dated before 1050, though this in no case makes the body of any large church, and its interest is more archæological than architectural.

ANGLO-NORMAN ROMANESQUE, C. 1050, C. 1160.

Following on the Conquest of England, the style of Anglo-Norman architecture becomes of moment in the history of Romanesque building. The amount and scale of it in the southern part of our island will bear comparison with what was being done abroad at this date, and no district of Europe of the same extent can claim the possession of work of greater importance in the development of Romanesque. The character of this building was due to the circumstances of the Norman invasion. The Benedictine domination of West Europe had been used as a political force to complete and establish the Conquest, and this monastic annexation of England resulted in an era of building extraordinarily fertile in great churches. Between 1060 and 1160 were set out and built in our island abbey and cathedral churches remarkable even in an age of massive architecture. Also, owing to the habit that in England the seats of bishops were frequently set in the Benedictine churches, their structures have survived to our day, whereas in France the greatest abbey churches, such as St. Martin's at Tours or Cluny in Burgundy, have been practically effaced. The combination of monastic with cathedral dignity is almost peculiar to England, and the monastic type given to our early architecture has throughout been one of the sources of English style, and in one way and other has separated the art of our mediæval building from that of the Continent.

The Early Benedictine Building.

M. Camille Enlart, has in Michel's "Histoire de l'Art" excellently summarised the main distinctions of the English Romanesque; the unadorned massiveness of the Anglo-Norman construction; the great length of the many-pillared naves; the projection of the transepts, and the apse-bayed extension of the quires; the right-angled simplicity of the masses, and the uncompromising sheerness of the towers. The nave and lantern (1077-1088) of St. Albans Abbey church (where spoilt by modern rebuilding) give us excellent examples of the earliest Benedictine building (1). In the well-preserved transepts of Winchester (1079-1083) and Ely (1090-1130), as also at Norwich (1096-1119), and particularly in the massive cathedral of Durham (1093-1133), is to be seen the great style of the Anglo-Norman monastic cathedral, remarkable not only for the Egyptian solemnity of its immense piers, but for the science of its builders. Here at Durham, as early as anywhere, was achieved that construction of ribbed vaulting, whose evolution became the creative force in mediæval style.

In the planning and details of this first English Romanesque the immediate origin is from the school of Normandy. In plan the above abbeys and cathedrals were, with the exception of Norwich cathedral, planned, as Canterbury was, by Lanfranc, on the "parallel apsed" type, which is that of the Conqueror's churches at Caen. It is the same in the construction of the bays—Chichester Cathedral (1090-1108), for example, was built with a bay design that closely follows that of the abbey church at Cerisy la Forêt (1030-1080).

But it must be also observed that the Benedictine domination was wide-spread in Europe, and dependence on the architectural province of North France does not make the whole sum of the English story. For example, some of the earliest abbey churches of Norman building, Westminster (1050-1165), Bury St Edmunds (1070-1096), and Lewes (1070-1200), had been planned with an aisled apse and radiating chapels; (2) Norwich (1096-1117) shows to this day a great part of such an east end.

The Late Benedictine Building.

Towards 1100, moreover, the Norman plans were superseded, as in the Canterbury rebuilding, 1096-1107; in that of Lewes, *c.* 1100; in the building of Reading abbey, 1121-1140. Also the central towers of the west fronts at Lewes, Bury, and Ely, are not of Norman use, but an echo from the great building in progress at Cologne and other places on the Rhine. Thus, too, in the second quarter of the twelfth century there are found extensions of the western facade in English churches with a great western transept, somewhat in German fashion. At Bury (*c.* 1130) this was 260ft. wide; at Ely (*c.* 1150-1180) nearly 200ft., in each case with flanking towers, as well as the central. The great western transept with flanking towers is found, too, at Lincoln (*c.* 1150-1160) and Peterborough (*c.* 1177-1193), the facades designed with big cavernous arches to their whole height, a method of building outside the manner of the Norman school.

Except at the last-named, these westward completions of the east-county abbey-churches retained Romanesque style up to the last quarter of the twelfth century, and as in Bishop Pudsey's Galilee at Durham (*c.* 1160), clung to Norman ornaments when these had been discarded elsewhere. But the belated building of the round arch in these instances may indicate not only the conservatism of the masons in the Benedictine buildings, but also that style in East England was still in touch with German Romanesque.

The Western Romanesque.

In the west of England English Romanesque developed in the first post-Conquest building, with certain differences, from that in the east; *e.g.*, it had a shorter, wider setting out of the naves, and apses polygonal instead of circular, as at Gloucester (1089-1100) and Tewkesbury (1090-1100). A similar departure from Normandy precedent is found in the columns of the naves of these abbey-churches, which are lofty cylinders that reduce the triforium galleries to insignificance. These peculiarities both of plan and construction may, however, be traced, as much to Lombardic as to Germanic origin.

The Cluniac Romanesque.

It is probable also that certain variations in England from the standard style of Normandy were due to the influence of the Cluniac building. This reformation within the body of the Benedictines was the moving religious force of the last years of the eleventh century; its architecture was for a time paramount in the south as well as the east of France, and came into England also. A much extended quire with double transept appeared in the mother house of the order at Cluny (*c.* 1090) and so too was it planned at the Cluniac, Lewes, in England (*c.* 1100), and then side by side was the similar setting out in the quire enlargement at Canterbury. And this model was followed in the eastward extensions of the English church for a couple of centuries.

Another indication of English arts having their origin in the Cluniac cloister is to be found in the twelfth century advance of figure-sculpture. There appear specially two developments; one in the south-east of England, as if spreading from the Cluniac, Lewes (Rochester west doorway being its most elaborate example); the other in the Severn valley, as if from the Cluniac house of Wenlock: the south porch sculpture at Malmesbury is a specimen. In both localities an elaborate Romanesque figure sculpture (3) dates to about the middle of the century, a special richness appearing in the tympana of doorways and in fonts.

The Native English Romanesque.

Side by side, however, with the importations of plan and style due to the cosmopolitan character of twelfth-century monasticism, there was the current building at the hands of the native masons. By the second half of the twelfth century this had certainly asserted itself as a national style. Since the smaller monas-

(1) Mr. Gardner's photographs at the Tufton Street Museum of the Architectural Association, and in those of Harrow School and Eton and Winchester Colleges may be consulted with advantage.

(2) St. Martin at Tours is considered one of the first of this planning—which occurs also under Cluniac influence extensively in the middle and south of France.

(3) In Kent, Barfreston; the Brighton font, etc. In the Severn Valley, Shobdon, and Kilpeck in Herefordshire, and many doorheads in that county, in Gloucestershire, Wilts., etc.

tic houses would not be able to train bodies of masons of their own like the great houses, but made a casual use of the local artisan, their church-building was cognate to that of parish-churches, and constituted with these latter no inconsiderable part of the twelfth-century style. The influence of this native craft grafted Saxon ideas on to the Benedictine architecture as can be well seen in the church at Romsey, where was one of those half-dozen nun's houses which in the neighbourhood of Winchester, the ancient Saxon capital survived the conquest, and carried on Saxon tradition. In the Romsey quire, built 1110-1120, we have not the Norman apses, but square-ended chapels. It is the same also in the hospital church of St. Cross, near Winchester, 1140-1160, while at Romsey an aisle is found squaring the presbytery at St. Cross, a square gable-end replaces the apses, and in both the details of construction as to window grouping, pier-sections, and arch-mouldings, exhibit English masons experimenting outside the lines of a Continental progress. The nave of the Southwell canons (1110-1150), and the remains of Malmesbury Abbey (*c.* 1150), are other examples of a native progressive building, the latter providing an early instance of the pointed rib-vaulting. The big cylindrical piers of these smaller monastic churches are to be noted as an evolution away from the functional use of engaged columns which the Normandy school had developed; they show the habit of that simpler art of English church-building which was mindful of the continuity of the wall and thought less of the mechanism of the vault. A peculiar development of pier is to be seen at Romsey; also at Jedburgh (South Scotland), and especially at St. Frideswide's, now the Christ Church Cathedral of Oxford (*c.* 1160), where the triforium gallery is tucked in under the pier arches.

The Cistercian Romanesque.

But in the direction of simplicity of construction (as antagonistic to the elaborate ornamental Romanesque) another important influence upon English style lay in the Cistercian building, which was in England very considerable from 1140 to 1200. At first, or, at any rate, in some cases (*e.g.*, at Fountains, where Burgundian details are evident), we may suppose there were brought not only the Cistercian plans, but also the building character of the mother houses, Citeaux and Clairvaux. In the same way *c.* 1170, the canons of Prémontré, founded with an equally strict and simple profession as to Cistercian, may be thought to have taken into England from St. Martin's at Laon masons or lay-brethren, who, skilled in the plain church-building of the order, would repeat the features of it. Yet in England most often the early Cistercian and Premonstratensian building, though it has parted with the profuse Romanesque ornament of the Benedictine tradition, as at Ford (Dorset, *c.* 1145), Buildwas (Shropshire, *c.* 1148), Roche and Kirkstall (Yorks, *c.* 1150-1180), Bradsole (Kent, *c.* 1181), has adopted the local style of English building, with no marked feature outside the native art. Such plainness was that, too, of the smaller Benedictine buildings, which were outside form the conservative masoncraft of the great houses, Ely, Peterborough, or Durham. Out of such mixed elements grew the impetus which with some rapidity towards 1170 advanced to the creation of English Gothic as a style outside any particular Continental school.

THE TRANSITION TO GOTHIC, c. 1160—c. 1200.

This may be reviewed in three divisions as belonging roughly to three districts, to be separated from those in which the architecture of the great Benedictine abbeys was still Romanesque.

The Northern School.

In the North of England the reformed communities, Cistercian monks and Augustinian and Premonstratensian canons were building their churches from 1160 onwards in many places. The quire of the Canons Church at Ripon, now that of the cathedral, affords a valuable if not very extensive example of this architecture. The same kind of work was in progress on a greater scale in Archbishop Roger's quire of York Cathedral, destroyed in the fourteenth century. Lanercost Priory Church, in Cumberland, consecrated 1169, has the same constructive style, and an example of pointed rib-vaulting. There came a wide extension of similar work, with a gradual advance in lightness and temerity of execution, in the building of the Cistercians at Fountains, Byland, Jervaulx, Furness, etc.; of the Benedictines at Tynemouth; of the Augustinian Canons at Lanercost, Hexham, etc.; of Bishop Pudsey at Auckland and Darlington. The northern style, so created in English Gothic, can be distinguished (1) by plans having a square-ended presbytery usually projecting to full height from an aisled quire; (2) by clustered piers of simple elements and slender proportion; (3) by an early development of pointed ribbed vaults; and (4) by lofty pointed lancets deep set in the wall, ranged with shafted arcades outside and inside the building. In these examples, the square-planned abacus of the Continental transitional usage can be seen early changing to the round-planned native type; also the use of the multiplied mouldings is here developed to a degree which makes them the sole decoration of the building scheme—carving, whether of the leaf or the figure, being sparsely used.

The Western School.

A second district of transitional style was in the west—where an individual Gothic, distinct from that of the north, is to be seen in the making. Its origin may be traced to the masoncraft of the Benedictine Abbey of Worcester, which showed new features in the building of the circular chapter-house (*c.* 1140), and then in the erection of the west bays of the nave (*c.* 1160), achieving in this latter an advanced Gothic construction, the fine vaulting of which is still to be seen in the aisles (4).

To what extent the Cluniac building at Wenlock Priory, a daughter of Charité sur Loire, may have been a power in the architecture that sprang from this beginning is uncertain; but at any rate, as already mentioned, an early figure-sculpture, which appears of Cluniac initiation, is distributed all along the Severn Valley, and in the same district there develops a leaf-carving of great liveliness and sculpturesque beauty. We can trace, too, the circular chapter-house of Worcester being adopted in the Cistercian foundations of Margam and Dore in South Wales, and with this the Worcester order of tripled shafts. While in these and many other works by their side, came the grace of the foliage capital, to b seen first developed at St. Mary's Shrew bury, the near neighbour of Wenlock.

The province of the western school e tended from Lichfield and Chester in Mi England to St. David's, in South Wale and across the sea to Dublin, in Irelan where the Christ Church Cathedral w erected *c.* 1175. In South England a di tinct example of the mason-craft appea at Whitchurch Canonicorum, Dorset.

The pointed arch was used by the we tern masons at Worcester, Dublin, a Llanthony (*c.* 1160-1175), though t round arch survived at St. David's (1180). The plans show a square-endi to the presbytery and eastward extensio of square chapels as at Hereford, Lla daff, and Dublin, and there are ma pecularities of detail which separ their art from that of the north and e of this date. In its southern extension t western school of building met and a sorbed the development of English l Romanesque that has already been ferred to at Malmesbury and Oxford. peculiar chevron moulding, founded the Norman zigzag, which continued w into the thirteenth century, beca characteristic of the province. The qu and transept of Glastonbury, which dated by documents to 1184, m be taken as the characteristic ample of both elements in the sou western transitional craft. But B hop Reginald's Cathedral of Wel building by the side of Glastonbury, hibits rather the Shrewsbury and Dub characteristics. There seems to my m no doubt that to this bishop (1174-11 must be assigned what we see of the ea work in the quire, transept, and east b of nave (5), though to the eye accustom to the French and German details of same date, the tracings of its mouldi seem very advanced. Here, however, elsewhere in our English art, the preco of finely divided moulding is remarkal as well as the complete use of the poin arch.

The South-Eastern School.

The third school of English tra tional style is that of the south-east counties, which can take its full illus tion from the rebuilding of Canterb quire (1174-1184). The story of this w is to be found in the contemporary hist of the monk Gervase. With his acco in our hand we can identify the deta so as to distinguish the large I played first of all by the French intro tions of the Master William of S (fresh, it is supposed, from the e Gothic building of Sens Cathedral), then by the different craft of the C stone masons working under him and successor, William the Englishm Under the new master (1180) foreign ments disappear, and we have the w of the native masons, grounded in na style in the building of Canterbury, create the English Gothic. The basi their craft was the English use Purbeck marble in detached shaf and thin moulded strings. It is difficu explain how the art and skilful wor of this marble grew up in the quarri Purbeck, at Corfe in Dorset. One be allowed to see the idea of it in the of Flemish black marbles as shafts Laach Abbey Church, near Cologn 1150), which prevailed in the angl country between the Ile de France

(4) Similar work of this date is to be seen also at Bredon, on the Severn, from which came the stone for the Worcester work.

(5) i.e., the lower stories—the nave vault later building.

he Rhine). The lie of Canterbury (6) towards the Continental district of this use, and then the fact that we find *c.* 1150) importation into England of objects of Flemish marble, such as fonts and slabs (which afterwards seem copied by the Purbeck marbler), give groundwork for this conjecture. But the peculiar progress of the English masons lay in the working out of the idea, their style proceeding on the same lines of multiplying mouldings and slender shafting which had appeared in the contemporary stone-workers of the north and west of England. The English technique can be seen in (1) the round-planned abacus; (2) in the carving of the crocket capital with the broad thumb-like midrib to the leaf, distinct from the treatment of either the Ile de France carvers or that of Normandy. The nave (7) of the Temple Church (consecrated 1185), in which we find a Purbeck-marble use of the same kind, was probably building side by side with Canterbury quire. So London was possibly the first workshop where the marblers got their skill. The east chapels of Chichester were begun (1186) immediately following the work at Canterbury, and in their building all the French character of that quire has dropped out (8) the pointed arch comes more completely into use, and the art of Caenstone and Purbeck marble develops features which seem carried on by the same masons to the Winchester chapels 1205). Lincoln quire (begun in 1194), and the Ely galilee (1198-1215), are contemporary, and show the propagation of this manner of English Gothic, which has been called "Early English." In this the characteristic Caen-stone mouldings of south England are found worked in the local stones, and often some local marble has been taken to imitate the shafts and string-courses of Purbeck.

EARLY ENGLISH, c. 1200-c. 1250.

A great impetus was given to cathedral-building by the return of the bishops to England, when the Pope's Interdict of England was removed (1213), and on King John's death in 1216 the national movement of our art had full play. The character of our architecture for the next generation may be described as largely insular, and, therefore, deserves the name of "Early English." The absorption of Normandy by the central French power brought to an end the Norman connections across the Channel, so that English builders were thrown very much on their own resources, except so far as the influence of Henry III.'s court tended to the promotion of French fashions.

The English style, if it be put beside the great French Gothic, which at the time was achieving that architectural supremacy which spread it throughout Europe, can be seen with important differences. In the first place, on the constructive side it never achieved either the scale or the system of the French architecture. That concentration of building stresses on to definite fixed points by means of arches which makes the essence of Gothic as compared with the domical methods of Byzantine, or the lintol treatment of Classic and Egyptian building) never reached at this time in England complete realisation; the wall was not exterminated as a building asset, as we see this done at Amiens or Sainte-Chapelle in Paris. On the other hand, in delicacy and variety of moulding, and especially in the tracery of vaults and windows, there were many refinements obtained in the English art that only later appeared in the French. In one point there is an exact parallel. Just as the art of the Ile de France at this period spread itself as a distinct style supplanting the local transitional Gothic masoncrafts, so in the British Isles a practical uniformity of masoncraft replaced the local schools of it, which had belonged to the transition. The south-eastern manner (already described) of building with a soft white freestone, set off with dark marbles, appears after 1220 in all parts of England—at Fountains and Durham in the north, and at Exeter, Wells, and Worcester in the west. Moreover, in Scotland, at Elgin and Glasgow, and in Ireland, at Kilkenny and Dublin, the methods of building are those of English masons.

Early English Plans.

The English traditions of quire-lengthening with double transept and eastward extensions of square-ended Lady-chapels appeared in many forms in thirteenth century church-plans. Two special varieties were simultaneously in use for the largest churches; one practically confined to the south and west of England, in which the high body of the presbytery was stopped short while eastward of it are lower extension of square-ended chapels; the other characteristic of the north and east of England, where the high gables of the quire were taken right on to sheer endings of full height to the east. In France among the largest foreign churches only Laon has this latter ending, but certain of the Breton cathedrals and larger churches exhibit both of the English types.

Early English Vaults, Windows, etc.

The early introduction of extra ribs (*tierceros*) and ridge-pieces (*liernes*) into the English vault made its development differ from that of the Continental. Thus the English vault was low in comparison with the Continental, and particularly the flying buttress was sparingly used, and never had either the constructional efficacy nor the conspicuous external assertion given to it in the French cathedral. On the other hand, the lancet window, in its beautiful groupings and with its lofty grace, is a feature of English style, giving our smaller work a dignified elegance, specially striking when combined with lofty wall arcades on gables and fronts as at Ely quire, Lincoln, and the many abbey churches of Yorkshire. In detail the round-planned abacus of the pier, and with this the moulded capital, have a character of finish and delicacy in the English treatments which so appear usually to depend on architectural qualities, rather than present themselves as great combined conceptions of scuptural fancy, like the fronts of French churches, such as Chartres and Reims. Particularly the great cavernous porches, peopled with a thousand statues, of the French school were absent. The English doorways were in comparison insignificant, and the figure-sculpture of the English church was detached in rows of arcades, though sometimes covering the whole front of the building, as at Peterborough, Lincoln, and especially Wells (9) and Lichfield.

Early English Examples.

The chief works of this era were as in the French art, the great churches of the Bishops, *e.g.*, at Lincoln (1198-1260) and at Salisbury (1220-1258), whose cathedrals may be taken as the typical buildings of the English art. The smaller quire of Beverley, in Yorkshire (1225-1245) is a building designed also not for monks but for secular canons, with all the best points of the English character. The limitations as well as the beauties of Early English can be seen in other examples, such as the Worcester quire (1202-1240), Ely "Presbytery" (1235-1252), York transept (1250-1260), and the Durham "Nine Altars" (1242-1280). The difference of English architectural motives from those of the French can also be appreciated in the great architectual screens that were built at Peterborough (1190-1230) and at Wells (1220-1242). Finally, one of the best examples of the peculiar manner of building that can be specially called English Gothic lies in the quire of Westminster Abbey (1245-1260), although here built directly under French influence as to the plan of its apsed *chevet* and the height and narrowness of its bay-scheme. It is clear that the tracings of plan and construction at Westminster were an intended importation of the ideas of the great French cathedrals, but the technique of the architecture is that of English freestone masons and Purbeck marblers.

MID-GOTHIC. C. 1250-C. 1300.

The plan and constructive features introduced at Westminster from the French style had no effect on the subsequent English development; still, that building appears as the early introduction of much that made a new era for our art. The distinct by-way which the English art had followed for half a century runs into the main course of European art about 1245, and our masons are to be seen absorbing many of the developments of masoncraft which the building of Amiens cathedral and the Sainte-Chapelle, at Paris, had introduced.

Mid-Gothic Tracery.

Of these absorptions that of the widest consequence was as to bar-tracery, for this transformed both the construction and the decoration of English architecture. The wide window meant a more logical type of Gothic construction than had as yet been achieved in the English art, and its tracery led bit by bit to the most typical developments of English style. It is remarkable that in this way English building served as the "host," to use a biological term, from which were hatched out the forms which finally bred in France itself to French "Flamboyant."

Mid-Gothic Carving.

Another of the introductions of the second half of the century was that of naturalistic foliage in stone carving, which had for some time developed in the art of both the Ile de France and the Caen-stone masons. By its side the naturalistic treatment of drapery had been achieved by the sculptors of Paris in the statues of Sainte-Chapelle. Both appear now in the English art (1270 to 1290).

(6) See too at Chichester, Boxgrove, New Shoreham, and New Romney, work 1150-1170, of Picardy style.

(7) The complete rebuilding of this in the nineteenth century has practically destroyed its evidences of style.

(8) The capitals of the piers of the presbytery show, however, a type to be seen at Notre Dame, Paris, but with English detail.

(9) Only at Wells is any great quantity of this sculpture now in existence.

Mid-Gothic Examples.

The developments of detail can be seen with immediate effect in London in the cloister and octagonal chapter-house of Westminster (1250-1260), and then in the building (1260-1300) of the great quire of St. Paul's (destroyed in the fire of 1666), which had considerable elaboration of window. By 1270 the revolution was complated in all parts of England, initiating what may be called the central or summit style of our English mediæval building. Its finest works can be seen at Salisbury in the cloister and chapter-house (1250-1280), laid out on the Westminster lines; at Lincoln in the "Angel Choir" (1256-1280), in which much of the sculpture seems that of Westminster; in the nave at Lichfield (*c.* 1270); in the north transept of Hereford (*c.* 1270); in Merton Chapel at Oxford (1275-1280); in the fine octagonal chapter-house of Wells (1286-1310); and in that of Southwell (*c.* 1290). Beautiful fragments of this art are to be seen, too, in the buildings of many ruined abbey-churches, such as St. Mary's, York (1271-1290), Guisborough (*c.* 1290), Kirkham (1290), Bridlington (1279-1290), all in Yorkshire; Thornton Abbey chapter-house and quire in Lincolnshire (1270-1300), and particularly the beautiful Tintern Abbey in Monmouthshire (1262-1300).

The broad proportions of this church-building, its lowness and the full romantic detail of its architecture, as well as the English character of its plannings, separate the whole effect with some distinction from that of contemporary French building, in which the rigid logic of constructiveness was in some instances now getting lean and mechanical. The chief experiments of English masons (1250-1300) lay in their development of branch (*tierceron*) vaulting, the whole history of which can be seen in English circular and octagonal chapter-houses, vaulted from a single pillar. The series runs from the twelfth-century example of Worcester, through those of the early thirteenth century at Lincoln and Beverley, to the three consummate examples of this period at Westminster, Salisbury, Wells; to be immediately followed by that of York, where the pillar is dispensed with, and the wood-ribbed vaulting peculiar to England takes the place of stone (10). As well as the chapter-houses, one cathedral can be taken as the example of style in our late thirteenth century masons. The rebuilding of Exeter Cathedral was begun *c.* 1270, and its choir and transepts show work before 1300. Though the complete finishing to the west facade lingered on till 1350, the early work was the model of the whole, and the effect is mainly that of a building of the mid-Gothic English style. It is to be noted how in this the early slender shafted use of Purbeck marble has been replaced by full clustered columns and how every variety of tracery finds place in the broad windows.

DECORATED C. 1300-C. 1350.

The first part of the fourteenth century carried every variety of constructive decoration in England to the extreme of luxuriance. In the search for motives our building made one striking variation of architectural form which is of importance to the history of Gothic style outside our islands. This was the introduction of the ogee curve (*accolade*) into arch and gable.

(10) See besides those at York other examples of wood shaped to resemble stone vaulting at St. Alban's quire (c. 1290), Lincoln cloister (c. 1290), Selby quire (c. 1320), and Ely octagon (c. 1345).

The Ogee Curve in the Canopied Niche and Window Tracery.

Up to *c.* 1300 geometrical figures and finished lines of regular arch-construction governed the shaping of stone for architectural use. But now sinuous and continued lines are set upon the face of architecture, to the neglect and often to the denial of the actual facts of construction. The complete surrender of all decorative architecture to the flowing motive was the particular mark of the last French Gothic style, called Flamboyant. But that a hundred years earlier the English mason had laid the foundation of this surrender is undoubted, and this is now recognised by Continental archæologists. Indeed, in North England, at any rate, for some twenty years the flowing line dominated tracery and canopy lines. Still, it must be observed that generally for English building of the first part of the fourteenth century the ogee curving was only one of many unconstructional devices by which the architectural decorator achieved that romantic exuberance of variety which he affected. The real plaything of his genius lay in the canopied niche, flanked by pinnacles and headed with a striding gable. These "decorated" niches of every shape, varying from extreme simplicity to extreme bravado, are the staple of fourteenth-century architecture, and are pressed into every service of decoration, in glass painting, tile decoration, and in all the uses of woodwork, as well as in all stone constructions, large and small alike. In the constant repetition of this use the gable lines curved upwards at the meeting point, and licked up, as it were, the arch construction that had had the function of supporting them, until at last an ogee-headed decoration masking the actual structural fact was built as the stock architectural form (11). Still, as regards the window tracery, the ogee curve had many rivals, and when towards 1330 it seemed on the point of universal adoption, its decorative supremacy was immediately invaded by the straight-lined panels of the Gloucester school of masons—in half a generation, only a quite limited sphere had been conceded to the *accolade*.

In the treatment of the canopied niche, and its decoration by ogee and other fanciful lines, there were in England simultaneously some dozen more or less distinct manners which were characteristic of different schools.

The Northern School.

There was a well-marked northern school of decorated art, which may be called the York school, since its craft worked in the magnesian limestone (Huddlestone from Tadcaster being the chief kind) centreing from York. Its examples abound in the fine group of Yorkshire abbey and collegiate churches that were built in the fourteenth century, and carried on the traditions of the previous Yorkshire Gothic. The fronts of these northern churches were composed with very wide and lofty windows, flanked with buttress masses of great bulk and variety, and crowned with solid pinnacles, and crowded with a multitude of niches, while the gables were enriched with pierced and pinnacled parapets. Much of this art, whose province stretched northwards and westwards to Durham and Carlisle, has perished, but the quires of Ripon (*c.* 1300), Selby (*c.* 1315-1330) (12), Howden (1310-1355) give the character. The window traceries show a flowing tracery with a peculiar constructive scheme in its arrangement, as of vegetable growth, and the screens and canopies were developed with extraordinary luxuriance of sculptured ornament and a peculiar projecting ogeed arch that is characteristic (see the Percy Tomb at Beverley, *c.* 1330).

(11) Some of the earliest instances of the reverse curve in an arch form are in wood screens, to which of course it was not constructively inappropriate—e.g. in the chancel screen of St. Mary's Hospital, Chichester. Here on one side the geometrical piercings are regular and complete, on the other the bars run together, and the ogee curves absorb the geometrical spandrels.

The East Midland and London School.

Further south, passing into the region of the Lincoln, Ancaster, and Rutland stones, though we find the Yorkshire character in the niches and traceries, there is a greater flatness of decoration (see Lincoln centre tower, *c.* 1307, and Southwell quire screen, *c.* 1340, as extreme examples); and when we get to Ely (Lady Chapel, octagon crossing and quire, 1321-1350), and Norwich (east side of cloister, *c.* 1300), though there the connection with York art is close (*e.g.*, the canopies of Ely Lady Chapel), there are mixed characters in the building due to the influence of another big province of style. This we may roughly call that of London, although the fourteenth-century work of the great London monastic churches is no longer in existence to give examples. Still, there are remains in the districts round, as well as the small fragments left in London itself (as in Ely Chapel), sufficient to mark the capital city as the centre of a distinct type of work in which (a) the ogee curve has much less supremacy than in the York school; (b) the window traceries are without the marked constructive *branching* growth, and intsead develop wide square spacings (one variety of which is specially called Kentish traceries, to be seen in Prior d'Estria's screen at Canterbury, *c.* 1305); and in which (c) the gabled canopies are straight-lined and the fillings, largely geometrical, as if more than in other parts of England in touch with the Continental conventions of the date. There is, too, to be seen (d) in work immediately of the neighbourhood of London (as at Waltham Abbey Lady Chapel, *c.* 1320, and Dunmow Priory, Essex), a peculiar succession of fillets and hollows as well as great delicacy in the mouldings.

The West Midland School.

To the west, in the district of the Dunstable stone, as in St. Albans Lady chapel (1291-1326), there is London style of less delicacy; and at Dorchester (quire, *c.* 1300), and Oxford (B. Lucy's Chapel 1320), where the window traceries develop themselves down into the lights, we reach the confines of the sandstone masoncraft of the Midlands, which becomes of coarser execution in Lichfield quire and Lady chapel (*c.* 1320-1340). Throughout the Midlands there is (as distinguished from the *branched* tracery of the North of England) a predominance of diapered patterns, which combine flowing with geometrical designs. Especially developed is a variety called *reticulated* tracery, that is widely spread in England, Ireland, and Scotland (see Westminster Abbey cloister, 1330-1380, and Wells Lady Chapel, 1310), as well as the Oxford window above mentioned).

(12) Bolton Abbey in Wharfedale has a beautiful ruined quire of the art. The great west window of York and the east window of Carlisle are the largest of the style, but modern restorations have much falsified the mediæval building of the fronts of these Cathedrals, and lately also that of Selby.

The South-Western School.

Further west again we have a peculiar potting of the work with a profusion of all flower, as in Gloucester (south isle of nave, 1318-1320); at Tewkesbury quire and vaulting of nave, *c.* 1325). At St. David's (Gower screen, etc., 1324-1347) we find a rich and romantic type of fourteenth-century style, which is worked in the free oolities and sandstones of South Wales and its borders, and boldly uses ogee and other variously-shaped arch-forms as features of construction. In close connection was the art of Exeter Cathedral (already touched on), in which window traceries of geometrical patterns in all kinds of variation are mixed with the reticulated and branching types of the Midlands and the North. One interest of its south-western art was its conveyance across the Channel to Brittany, which so became for a time included in its school, many churches there have the square-ended chapels and eastern gables of the English southern art and the mixed flowing and geometrical traceries and constructional ogee arches of Exeter and St. David's (see Treguier, Folgoet, St. Pol de Leon).

The Bristol and Gloucester School.

But among the many and varied manners of fourteenth century art, the most significant is that which developed first at Bristol and then at Gloucester. The essential quality of this lay in its placing architectural construction on the level of the production by city crafts of architectural furniture—screens, shrines, and monuments such as had long been the work of shops. One can see the genesis of the Bristol style in the furniture of Exeter quire (*c.* 1308-1316), *e.g.*, in the sedilia, in which stone and marble are given all the unity of wood or metal construction, with a series of tabernacles set one on the top of the other. With just this ideal of reducing masonry to a skeleton of worked stone was the vaulting of Bristol quire carried out (*c.* 1315), which appears a long step from that of Exeter in the direction of the complicated constructions that were to be the rule for 200 years. The Bristol craft of skeleton stone-framing was passed on immediately to Wells (for the support of the tower *c.* 1328), and probably to Salisbury for the building of the spire (1334). The Gloucester mason carried it still further in the replacing of the twelfth-century transepts and quire (south transept 1331-1357, and quire 1357-1377). Here all the elements of the English perpendicular style have been created. The characteristic upright panel was used in the tracery of the east window at Bristol, and gets further development in Wells quire (*c.* 1340). At Gloucester it has become necessary filling of architectural spaces, whether of wall or window, the whole scheme becoming one of masonic dexterity. At Tewkesbury the open-work chantries show framings of stone-work, with many devices of constructive decoration on the Gloucester lines. Finally, Gloucester Cathedral itself is just an enlarged version of a chantry making use of the mass of the Romanesque construction for its support (13).

(13) Also the reredos of Christ Church Priory, Hants., and the tomb of Edward II. in Gloucester Cathedral. The furniture-craft of Exeter and Bristol was in close connection with London at this date. The collegiate church of Ottery St. Mary, near Exeter, should also be mentioned in connection with the genesis of the Gloucester style.

PERPENDICULAR, C. 1350-1550.

The Black Death of 1349 was the event which lifted the craft of the Gloucester mason from its place as a mere local variety of style, and established it as the standard architecture for the whole of England; and, moreover, bequeathed this style as an enduring national type of art. These effects may be sketched as resulting as follows. First, by the extinction of the many local crafts—the extermination of the masons providing a fair field for a fresh style; secondly, by the circumstance that the Gloucester mason survived the plagues, for we find him continuously employed during the years of them, and his work shows no break or change of style; thirdly, by the organisation of labour made necessary by the plague, legislation endeavouring to bind the artisan to the soil, while the mason was given free license to travel, and his status considerably raised. Such king's clerks as William of Wykeham would seem to have made bureaux of building, pressing masons into Government service for the carrying on of the royal works. Under these circumstances the Gloucester mason was alive to build, was in demand, had leave of travel, and was efficiently organised—no wonder, therefore, that his style of building spread.

Early Perpendicular Works.

At any rate, there came all over England, *c.* 1375, a uniformity of building detail that is in much contrast with its variety of thirty years earlier. The local manners, as those of Yorkshire and the Eastern Counties, were not superseded immediately after the Black Death, but still they became tinctured with the lean construction, the straight-lined traceries, and rectangular panelled spacings of the Gloucester ideal. York quire (in which building was resumed 1361), and the similar fresh starts at Hull and Newark churches, show architecture with many of these features of the Gloucester mason-craft (14). In the Eastern counties the grand ideas of the early fourteenth century died hard, as witness Walsingham quire; yet Ely Lady Chapel (east window, 1371) and Peterborough west porch (*c.* 1375) have acquired Perpendicular detail. In London building went on with no perceptible break, but as the Court at this time was often at Gloucester, the intermixture of the western style comes immediately into the works of the king under the suveyorship of William of Wykeham. In the West, close at hand to Bristol and Gloucester, the passage of perpendicular building into general currency can be seen in the building of Edingdon Church (*c.* 1361), in the rebuilding of the Winchester west front (1360 or 1370), in that of Canterbury nave (1379-1400), in Winchester College (1387-1393), in Winchester Cathedral nave (1390-1400). The Lady Chapel of Christchurch Priory in Hampshire, too, is of this early work.

Perpendicular Chapel-Building.

The peculiar magnificence of the last English mediæval building is to be seen in the collegiate chapels of New College, Oxford, 1380-1400; of Windsor, 1473-1525; of King's College, Cambridge, 1446-1540; and in Henry VII.'s chapel added to Westminster Abbey 1500-1512. In these later works, though the details of tracery and moulding show small variation from the Gloucester types, there has developed a flattened arch form, which is the special constructive mark of the style. Also in the elaborate fan-vaultings (first to be seen on a large scale in the Gloucester cloister of 1351-1377), a use of elaborate hanging pendants from the ceilings was particularly developed under the King's surveyors, and had its most complete realisation in Henry VII.'s Chapel at Westminster. Many fan-vaultings of great beauty were without these characteristic pendants however, as at King's College Chapel and those of the rebuilding of Sherborne Abbey Church (1436-1500), the Peterborough eastern chapels (1438-1500), and Bath Abbey Church (1500-1539). Elaborate lierne vaults with sculptured bosses at the intersections of the ribs equalled these fan-vaults in complication, as at Gloucester, Winchester, and Norwich Cathedrals, and in Windsor Chapel.

(14) See also at Howden and Durham; this Gloucester influence very probably came by way of London.

Perpendicular Parish Church Building.

The chief expression of perpendicular style lay, however, in the hands of the builders of parish churches, who by the end of the fourteenth century had enlarged them nearly to the size of cathedrals and abbey churches. Though the tracings of fifteenth century details scarcely alter from first to last, and are uniform throughout England, there is the greatest variety in their use, and particularly in parish building some special ideals of the English style of building were carried forward to their fullest realisation.

Perpendicular Wood Ceilings.

Wood ceilings and roofs, for example, had in the Perpendicular style their chief development, so that the most important examples remain in the domestic and parish church building. There had been characteristic English uses of wood throughout our mediæval architecture for ceilings; of the twelfth century, in Ely Cathedral nave; of the thirteenth, in Hayling Church, near Portsmouth; of the early part of the fourteenth century in the great hall of Worcester (now destroyed); and in the great roof of Westminster Hall of the latter part of the fourteenth century. In this series the early construction of a flat ceiling boarded under the great tie beams, gave place, first to open framed roofs, with constructed "principals," on Continental likeness, and then to the shaping of these to give an open arched vista through the length of the nave. For the complete furtherance of this ideal, English carpenters worked out the scientific hammerbeam method which allows the roofing of large spans with open ceilings, yet using only short timbers. Such are seen carried to the verge of audacity in the magnificent East country roofs, such as Blythborough and Wymondham in Suffolk, Sall and Trunch in Norfolk. Another type aiming at the same expression of continuity in the ceiling was with curved braces to the rafters from end to end, and is characteristic of the West-country roofs, such as Curry Rivel in Somersetshire and Kilkhampton in Cornwall. Another variant for the same purpose of lifting the wood construction for the benefit of openness lay in making the rafter-roof of low pitch, as in many of the city churches, especially of Mid-England—a good example is to be seen in south transept of Ely Cathedral.

Perpendicular Spires and Towers.

In their towers and spires, too, the fifteenth-century builders of parish churches showed considerable ambitions. Here, again, an interesting history of develop-

ment could be traced from the low stone steeples of the twelfth century to the lofty Northamptonshire spires of the thirteenth, and so on to the varied treatments which in Oxfordshire and Lincolnshire and other Mid-England counties produced beautiful fourteenth-century examples (15). After 1400, parish-church spires become still more ambitious, as those of Coventry and Louth in Lincolnshire. But by the side of the spire developed the fifteenth-century tower, never intended to be surmounted with a spire, as at Boston (Lincolnshire). In the character of their towers, just as in the wood ceilings, the local characteristics of building are apparent. In the Eastern Counties the square sheer type of flint panelled decoration has fine examples of Wymondha (Norfolk) and Lavenham (Suffolk). the West of England the freestone buil ing of the Somerset masons was shown richly-panelled and buttressed erectio as *e.g.*, of St. Cuthbert's (Wells) and Mary's (Taunton). As a final example can be pointed out how the mother cat dral of England, that of Canterbur erected in parish church style a lof central tower, the "Angel Steeple."

(15) Some of the most distinguished are those of Salisbury, Lichfield, and Norwich cathedrals, and of the parish churches of Patrington, Yorkshire; Kettering, Northants; Newark, Nottinghamshire; and Heckington and Grantham, Lincolnshire.

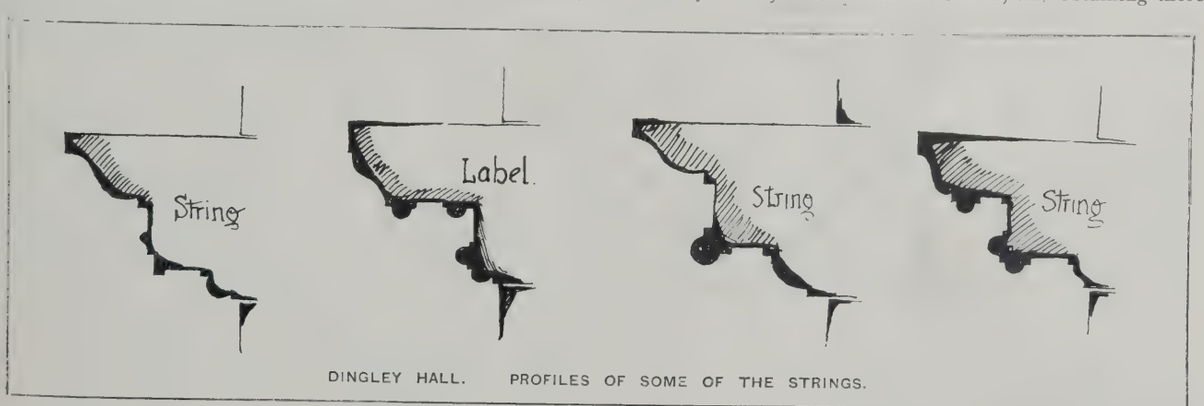
KNOLE KENT.

THE EARLY RENAISSANCE.

By J. A. GOTCH.

The Italian influence which made itself felt over the whole of Europe in all branches of design towards the end of the fifteenth century, reached England in the early years of the sixteenth. So far as anything so elusive as the beginning of a new style can be traced, it was to the Italian Pietro Torrigiano that we owe the introduction of Italian detail into England; and it was in the tomb of Henry VII., executed by the command of his son Henry VIII., that the foreign detail was first used. The splendid chapel at the east end of Westminster Abbey was built by Henry VII. to contain his tomb, and a design was prepared for the latter before his death; but when the direction of affairs fell into the hands of the new king, he discarded this design and entrusted the new one to Torrigiano, thereby frankly falling into line with the other great patrons of art throughout Europe in seeking inspiration from Italian sources. Another powerful and munificent patron of art, Cardinal Wolsey, also employed Italian artists in his great palace at Hampton Court; but it must not be supposed that the general appearance of that building was foreign: on the contrary, it was thoroughly English in conception, and only in certain ornamental details was the new influence apparent. For many years, and in all parts of the country, this restricted use of Italian forms was prevalent. They did not affect the general structure or appearance of buildings, but only certain parts of the ornament, particularly the carving. Nevertheless the tendency towards the Italian manner grew continually stronger, and it became more apparent as the sixteenth century drew towards its close. Many students in various branches of design travelled to Italy to acquire facility in the fashionable style, and on their return offered their services to wealthy noblemen and others who were engaged in works of building. For the convenience of those who could not go abroad, books were published from time to time setting forth the rules which governed the classic "orders," and giving examples of design in various branches of the building trade. Not only were some of the books in themselves crude, but they occasionally fell into the hands of unlearned artificers who availed themselves of their contents in a manner yet more



DINGLEY HALL, A.D. 1560.

crude, with results that strike the modern enquirer as sometimes humorous, sometimes pathetic, but nearly always interesting.

The workmen of the time, with whom (it must be remembered) lay the design of the details of their several trades, had been brought up in the traditions of their own country and district, and they evidently found the new style rather puzzling and difficult to blend with their native ideas. Nevertheless, they attacked the task with all the vigour and lightheartedness characteristic of the age; and produced work which, though far from classically correct, is yet highly piquant. In fact, its attractiveness lies in the struggle between old and new ideas which it illustrates.

This curious strife is chiefly confined to the ornament, the dressings with which the body of the building was adorned. In the essential qualities of planning and general design, the buildings were thoroughly English. The one foreign quality which was particularly emphasised at first was symmetry. Mediæval buildings—at least domestic buildings—were as a rule irregular in their disposition, although towards the end of the fifteenth century a tendency towards symmetry is observable. But with the growth of the classic influence symmetry became more and more adopted, often to the detriment of a truly logical treatment. Wing was made to answer to wing, door to door, window to window. But subject to these limitations the old freedom of planning was preserved. As the years went by, however, the new influence increased, and not only was a more strict symmetry adopted, but a more truly classical arrangement of features and a more careful attention to detail.

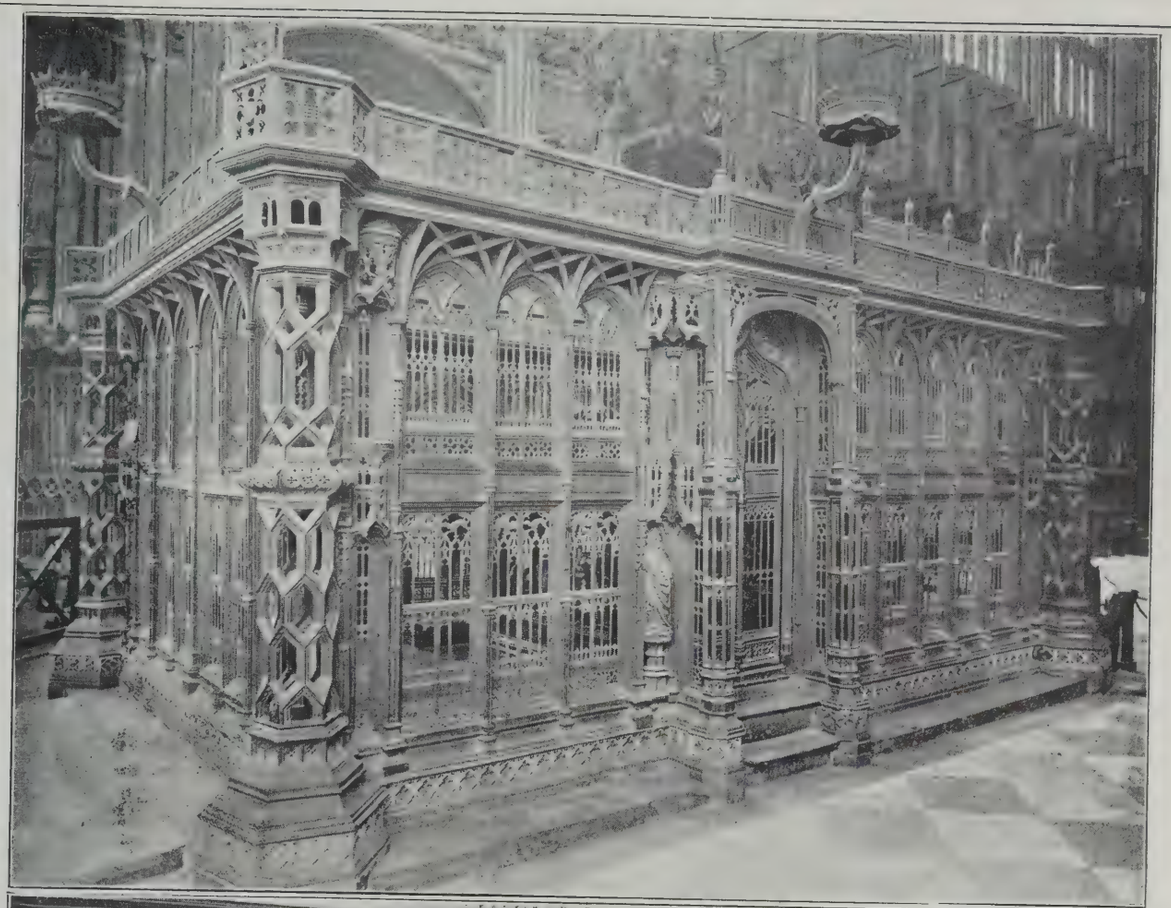
One of the early efforts of a country mason to combine classic profiles with some of the beads to which he had been accustomed in Gothic work is to be seen in the cornices and strings at Dingley Hall (1558-60). But the day was coming when details of all kinds were to be supplied no longer by the workman, but by the functionary who hitherto had chiefly concerned himself with furnishing the general design and in overlooking and, to a certain extent, harmonising the work of the various handicraftsmen, and who was known as the "surveyor." As the text-books increased, and the desire for classic detail hardened, the surveyor took more and more to supplying designs for all the trades, and obtaining thereby a

DINGLEY HALL. PROFILES OF SOME OF THE STRINGS.

more homogeneous building; his duties became more like those undertaken by the modern architect; but with the advent of the first distinctive English architect, Inigo Jones, a fresh chapter was opened in architecture, and one at which the Early Renaissance stops short.

It will be seen from the illustrations how symmetry influenced the general arrangement of the plan, and also how classic detail was applied in a very free-and-easy manner to such features as pilasters, entrance doors, cornices, strings, and chimneys. Sutton Place, near Guildford (1523-5) is thoroughly Tudor in general appearance, but the ornamental detail is quasi-Italian. At Dingley (1558-60) where are the curious cornices already mentioned, the old arrangement of an entrance door placed between two defensive towers is preserved, but, like pistols of which the charges have been drawn, the towers here are more formidable in appearance than reality. At Kirby (1570-5) and Montacute (1580) which are examples of the larger kind of house, all thought of defensive precautions is abandoned, and the windows are so large as to dominate the design. Both these houses depend for their effect upon a symmetrical treatment, which, in the case of Kirby, results in a singularly dignified and noble façade. The smaller houses, such as Barlborough (1583-4) Sydenham (*cir.* 1600) and Stibbington (1625), also derive much of their character from the same cause, and owe very little to the use of classic detail. Lanhydroc (1651) is an interesting example of the retention at a late date, not only of an ancient feature in the shape of a defensible gatehouse, but of a treatment which, in less remote districts, had long been superseded by more strictly classic methods.

The finest example of Early Renaissance woodwork in England is the organ screen in the chapel of King's College, Cambridge; the detail is admirably vigorous, and is so well done that it cannot be the work of a beginner. There is no record as to who designed or executed this screen, and it is generally attributed to foreigners; but there were certainly a number of English craftsmen who were producing excellent woodwork of a similar character at that time. The detail is very like that of contemporary French work, and it is interesting to note that during Henry VIII.'s lifetime much of the new style partook of French character, whereas after his death it inclined towards the Dutch. The date of this screen is fixed within a few years by the initials which it bears, and it must have been executed between 1532 and 1536. The fine roof of the Middle Temple Hall (1574) is an example of the survival of mediæval methods amid the new kind of decoration; but these large open-timber roofs were being gradually superseded by highly-ornamented plaster ceilings, such as may be seen at Canons Ashby (*cir.* 1584), or the Red Lodge at Bristol (1590). The latter affords also an excellent specimen of the elaborate panelling with which the finer houses were adorned.



There was not much church-building after the dissolution of the monasteries, but there was a large amount of new woodwork, pulpits, screens, and pewing supplied to many churches; one of the finest examples is to be found at Croscombe, in Somerset (1616).

The last of the small illustrations gives a good idea of one of the long galleries which were so common a feature of the period; great pains were taken in planning houses to secure the longest gallery possible. This one at Knole (1605) is not by any means of abnormal length, but it shows how the ceilings were covered with a continuous pattern of raised ribs, and how the walls were clothed with wood panelling of simple but effective design.

ST. PAUL'S CATHEDRAL, LONDON: WEST FRONT. SIR CHRISTOPHER WREN, ARCHITECT.

THE LATER RENAISSANCE.

By MERVYN E. MACARTNEY.

The period generally known in England as the Later Renaissance is of special interest to the student of British architecture, for it marks a definite point of departure in style, and we get the first clear indication of our modern house plan. The buildings designed by Inigo Jones are substantially identical with the home of to-day, the only point of difference being the improved accommodation allowed to domestics, the outcome of greater attention to sanitary and hygienic conditions now prevalent. We have the two greatest architects of modern time—Inigo Jones and Christopher Wren. They are no mythical personages, but real actors. The former is a most interesting character; the story of his life (1573-1652), passed in one of the most exciting periods of the nation's existence, is romantic and poetical. The son of a rather unsuccessful merchant in the City of London, he comes into prominence as a diligent student of Italian art, one of the first to make a definite attempt to put on paper the exact proportions of the orders. He spent many years on this work in Italy, and made the acquaintance of some of the master minds there. The exact dates of his visits to Italy are uncertain. He applied himself to a very close study of ruins in Rome, verifying illustrations in his "Palladio," correcting mistakes, and taking notes on buildings. These show that he had studied the writings of Serlio, Vignola, Fontana, and others. That in this study of ancient work he achieved considerable renown is evident by his being appointed architect to Christian IV., King of Denmark, a post he held for a few years. That he was the designer of the Copenhagen Customs House requires more evidence than the mere traditional statement. Though a charming and quaint structure, its clumsy detail and uncertainty of outline point more towards a Teutonic hand than his. Tradition also speaks of Jones having designed such important buildings as the Castle of Fredericksborg and the Rosenberg Palace. Neither of these buildings, probably, is to be ascribed to him, and the truth, in all likelihood, is that Inigo Jones was employed in some subordinate position, such as draughtsman to King Christian.

He was the first British architect who was really a draughtsman. When he returned to England he was engaged in the preparation of many masques—a strange line to our modern ideas, but one that was evidently congenial to him. He collaborated with Ben Jonson at first; then there was a quarrel, and the latter abused his friend in two or three of his verses. His designs were numerous, and were scattered over the whole of the southern part of the kingdom. He began the Greenwich Hospital, also the Palace of Whitehall, only one fragment of which was erected—the Banqueting Hall—which remains to this day. The old Banqueting House had been burned in 1619. Inigo Jones's design for the new hall was finished in the spring, and the first stone laid June 1st same year. The building was completed in 1622, and, sumptuous as it is, it is but a small part in the general and final scheme. However much we may deplore the lack of funds which prevented Charles I. from giving Inigo Jones a free hand, we must be thankful for what we have got. Fragment though it is, the Banqueting Hall is, in the opinion of many, the most perfect building in England, and the bold originality of its design showed that Inigo Jones could produce work rivalling that of the finest Italian architects, and in a style which until then was practically unknown in England. He also built the south portico to the St. Paul's Cathedral which was destroyed. From drawings it does not strike one as successful; but his church of St. Paul's, Covent Garden, has a grandeur that stamps the author as a genius. It is impossible in the limits of this short article to enumerate all his designs, but beyond those mentioned above we may add several domestic buildings—Raynham Park, Norfolk; Colehill, Berkshire; Leinster House, Lincoln's Inn Fields; West Drayton, Berkshire; Wilton Park, Wiltshire. Inigo Jones's only known pupil is John Webb, who married one of his kinswomen, and carried out work evidently under his directions and information, but it lacks the charm of proportion and invention displayed by his teacher. There is much that is attractive that is attributed to Jones that was done by Webb, but we may safely put down Thorpe Hall and Ashdown Park to the latter. Burlington House, Piccadilly, and Gunnersbury House, Ealing, are other specimens of Webb's work, who was, on the whole, a capable if not a very original architect, working in the manner he had learned from Inigo Jones, but without his knowledge.

Christopher Wren was another architectural genius, but the training of the two men was quite different. Jones studied deeply in Italy. It is doubtful if Wren ever went there. He visited Paris, but that appears to be the extent of his travels. The bent of his mind was scientific. He was one of the founders of the Royal Society, a Fellow of All Souls, Oxford, an acknowledged authority on mathematical subjects, and may be regarded as the best example of an English cultured architect. When not yet sixteen years old he was described as one who had "enriched astronomy, gnomics, statics, and mechanics by brilliant inventions," and he subsequently was appointed Professor of Astronomy at Gresham College and Savilian Professor of Astronomy at Oxford. He was, in fact, nearly thirty years old before he turned his full attention to architecture, and though in the end his early career had a good influence upon his designs, yet his first buildings without doubt suffer from the lack of any adequate training. No one can inspect his work at St. Paul's, Greenwich and Chelsea Hospitals, and Hampton Court without being struck by the scholarly refinement of the work. As a draughtsman he was undoubtedly inferior to Inigo Jones, but the consummate ability he showed in constructing St. Paul's shows that he was one of the most daring and yet successful designers that the world has ever seen. It would be impossible to give a complete description of this here. After St. Paul's, his finest achievement was the carrying forward of the Greenwich Hospital scheme. Few compositions can rival, and none can excel it. Hampton Court is another beautiful work. It has a quiet grandeur that marks it out as the palace of a king, and it is far more satisfactory than St. Germains, or Versailles.

Wren's practice was extensive, and includes besides St. Paul's an immense number of London churches, colleges at Oxford and Cambridge, many private houses, and three Royal Hospitals, *i.e.*, houses for injured and decrepit soldiers and sailors. The resourcefulness that he displayed in erecting churches on the sites previously occupied by Gothic churches burnt in the Great Fire, is a study in itself. With assistants he planned some fifty of these. Most of them exist to this day, and together with St. Paul's and Westminster make London the richest capital in the world in ecclesiastical mementoes. To attempt any rigid classification here would be quite impossible. The variety of Wren's churches must always be a source of astonishment to us. Some of the sites upon which he had to work were apparently hopeless, but nothing proved too hard for him, and he almost invariably worked up to the very last inch of his ground. The famous interior of St. Stephen's, Walbrook, is a case in point. By his bold original design, too familiar to need description, Wren has succeeded in producing out of a rectangular room the effects of a church with nave, aisles, and crossing. After all, however, Wren's strong point lay in his exteriors rather than his interiors, and his steeples and the tower and steeple of St. Mary-le-Bow, Cheapside, and St. Bride's, Fleet Street, are perfect examples of his genius. Among the other churches chiefly remarkable may be quoted the names of St. Lawrence, Jewry; St. Magnus, London Bridge; St. Martin's, Ludgate Hill; St. Clement Danes, Strand; and St. Michael, Paternoster Row. Wren saw strange revolutions in taste, from the free style of Charles II. to the plain severe models of the later Renaissance, and like his famous architectural compeer, lived to a great age (1632-1723).

It naturally followed that Wren had pupils and imitators in his steps. The principal successors were Hawksmoor and Gibbs, who were men of intelligence, but lacking those great qualities that distinguished the genius. Hawksmoor produced some fine creations, notably St. Mary's, Woolnoth, now debased by stations of the City and South London Railway. Another well-known church by him is St. George's, Bloomsbury, and besides rebuilding part of the quadrangle at All Souls, Oxford, and designing the new quadrangle at Queen's, he was associated with Vanbrugh at Blenheim as well as at

Castle Howard, though in neither case was he responsible for the design. Gibbs is best known as the architect who designed St. Martin's-in-the-Fields and St. Mary-le-Strand, and to him also we owe the Senate House at Cambridge; Radcliffe Library, Oxford; and St. Bartholomew's Hospital.

After these comes a man who marked out a line of his own. It is curious to note that two of the tritest epitaphs were made on architects. Wren's is well known, "Si monumentum quæris circumspice"; and of Vanbrugh, Dr. Abel spitefully remarked, "Lie heavy on him, earth, for he laid many a heavy weight on thee"—a fairly just quip if one looks at Blenheim and Seaton Delaval. Both of these are almost Brobdingnagian in their proportions. The former oppresses one. It is almost impossible to suppose it inhabited by mortals of ordinary stature. It seems to require vast men and women, and a pomp quite unsuited to modern habit. The curious thing about Vanbrugh's work is that he deliberately aimed at obtaining his grand effects by the almost complete sacrifice of detail. Sir Joshua Reynolds always held him in great esteem as combining originality with skill in grouping masses and understanding the effects of light and shade.

The next phase in British Architecture is a return to severe classic under the guidance of Colin Campbell, Kent, Archer, Ripley, James, and Wood. Wood deserves a special word and mention as the man who has made Bath what it is, having built the Circus, Crescent, Assembly Rooms, Queen's Square, and Parades. Of these men, however, it may be said, generally speaking, that to obtain their effects, they sacrificed a great deal of comfort and light; a mania for symmetry, and an unnatural insistence on this Procrustean idea drove them to strange and unjustifiable contrivances to achieve their object.

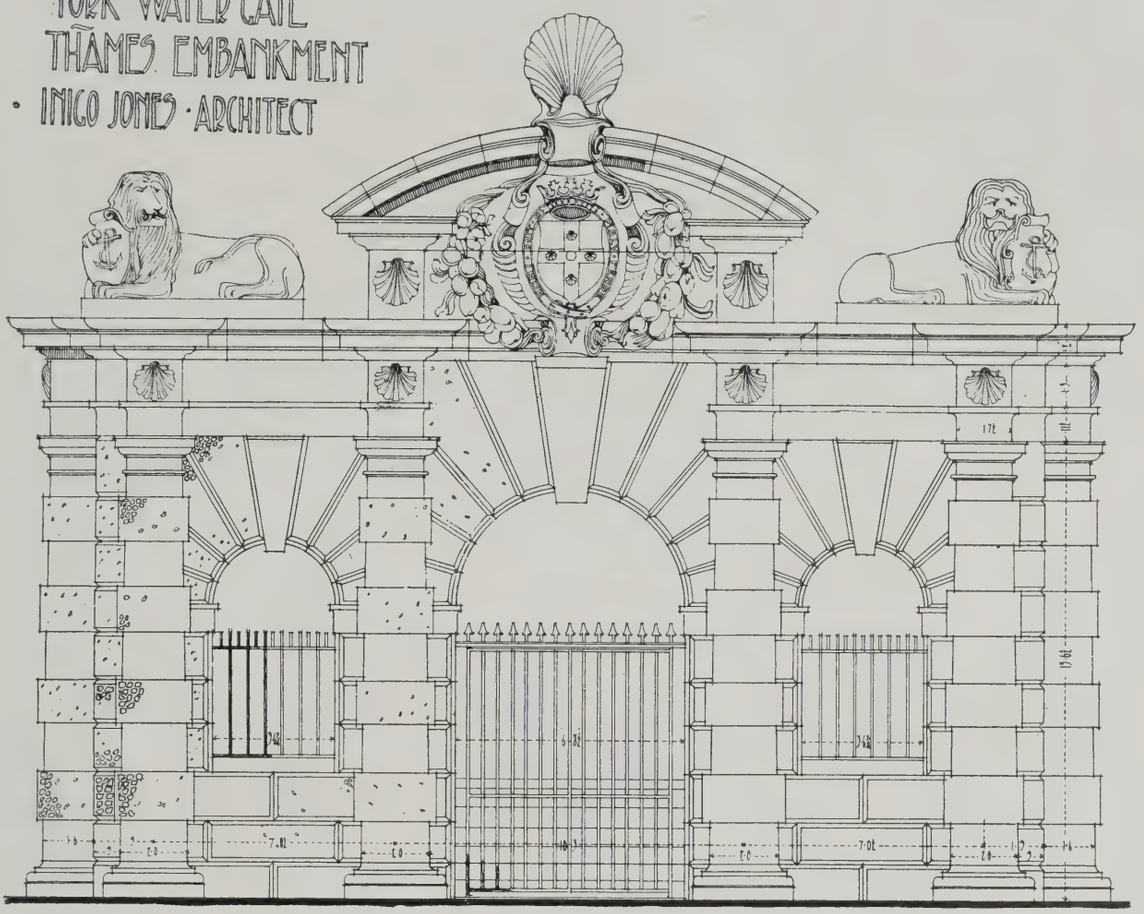
They were followed by the two Adams, men of a different type, who worked on model lines. Half architects, half contractors, they achieved a great vogue. Robert, the better known one of the two, carried out Lord Lansdowne's house in Berkeley Square, Sir Watkin Wynne's in St. James's Square, Kedlestone for Lord Scarsdale, Luton Park for the Earl of Bute, and many other houses for distinguished people of the day. Undeniably clever, and also immense believers in their method, they gained a celebrity which is hardly justified. By the introduction of a refined treatment of ornament and the employment of skilled Italian workmen, they designed work which is certainly charming as decoration, but is hardly serious architecture. The ceilings, chimney-pieces, etc., that they produced, are certainly beautiful, but their work is almost entirely interior decoration; not the handling of the more difficult art of architecture, the proper and artistic grouping of constructive building. The Register House at Edinburgh is their most successful effort, and that is marred by a smallness of detail; immeasurably inferior to the treatment it would have received at the hands of Inigo Jones or Wren.

We are now nearing the end of our list of prominent architects, but the work done in the later half of the eighteenth century and first half of the nineteenth is still well worth careful study. Sir William Chambers was throughout his career a very successful architect, building many houses for notabilities of the time, but his great work was Somerset House. His scheme was never carried out in its entirety, but the problems which he was required to deal with he solved with striking success. He took immense pains with all the details of the work, and the result has been a successful building. His other principal achievement was his treatise on "The Decorative Part of Civil Architecture," which remains as a text-book to this day.

Gandon, Elmes, and Cockerell, all classic men, did work that was monumental. St. George's Hall, Liverpool, the Customs House, Dublin, are compositions that place the designers in the front rank. Elmes died young, and his work was completed by Cockerell, but the composition as it stands was his. Cockerell was an architect of rare refinement, and his buildings at Oxford and in London show his intimate knowledge of classical detail.

Gandon was of a more robust type of architect, and his Customs House, Dublin, is a monument of his genius and power of design, being in its way quite as able as his teacher's design for Somerset House.

Dance (the younger), by building Newgate Prison, which was demolished a year or two ago, took rank with Chambers and Gandon as one of the most virile designers in this period, and his treatment of the vast bare wall has always been greatly admired. Of his other works, however, the only one worth particular mention is the hospital of St. Luke's, Old Street, which shows power and self-restraint combined with imagination of a very high order.



Our chronological review ends with Barry; in spite of the uproar that has raged round his name as the designer of the Houses of Parliament, there is no contesting the fact that it is a classic composition in plan and elevation. The detail is Gothic, and bears the impress of another's hand, that of Pugin. Trentham, Harewood, Bridgewater House, are fairer examples of Barry's powers, but even these are inclined to be heavy and lifeless. His most successful design is the Reform Club.

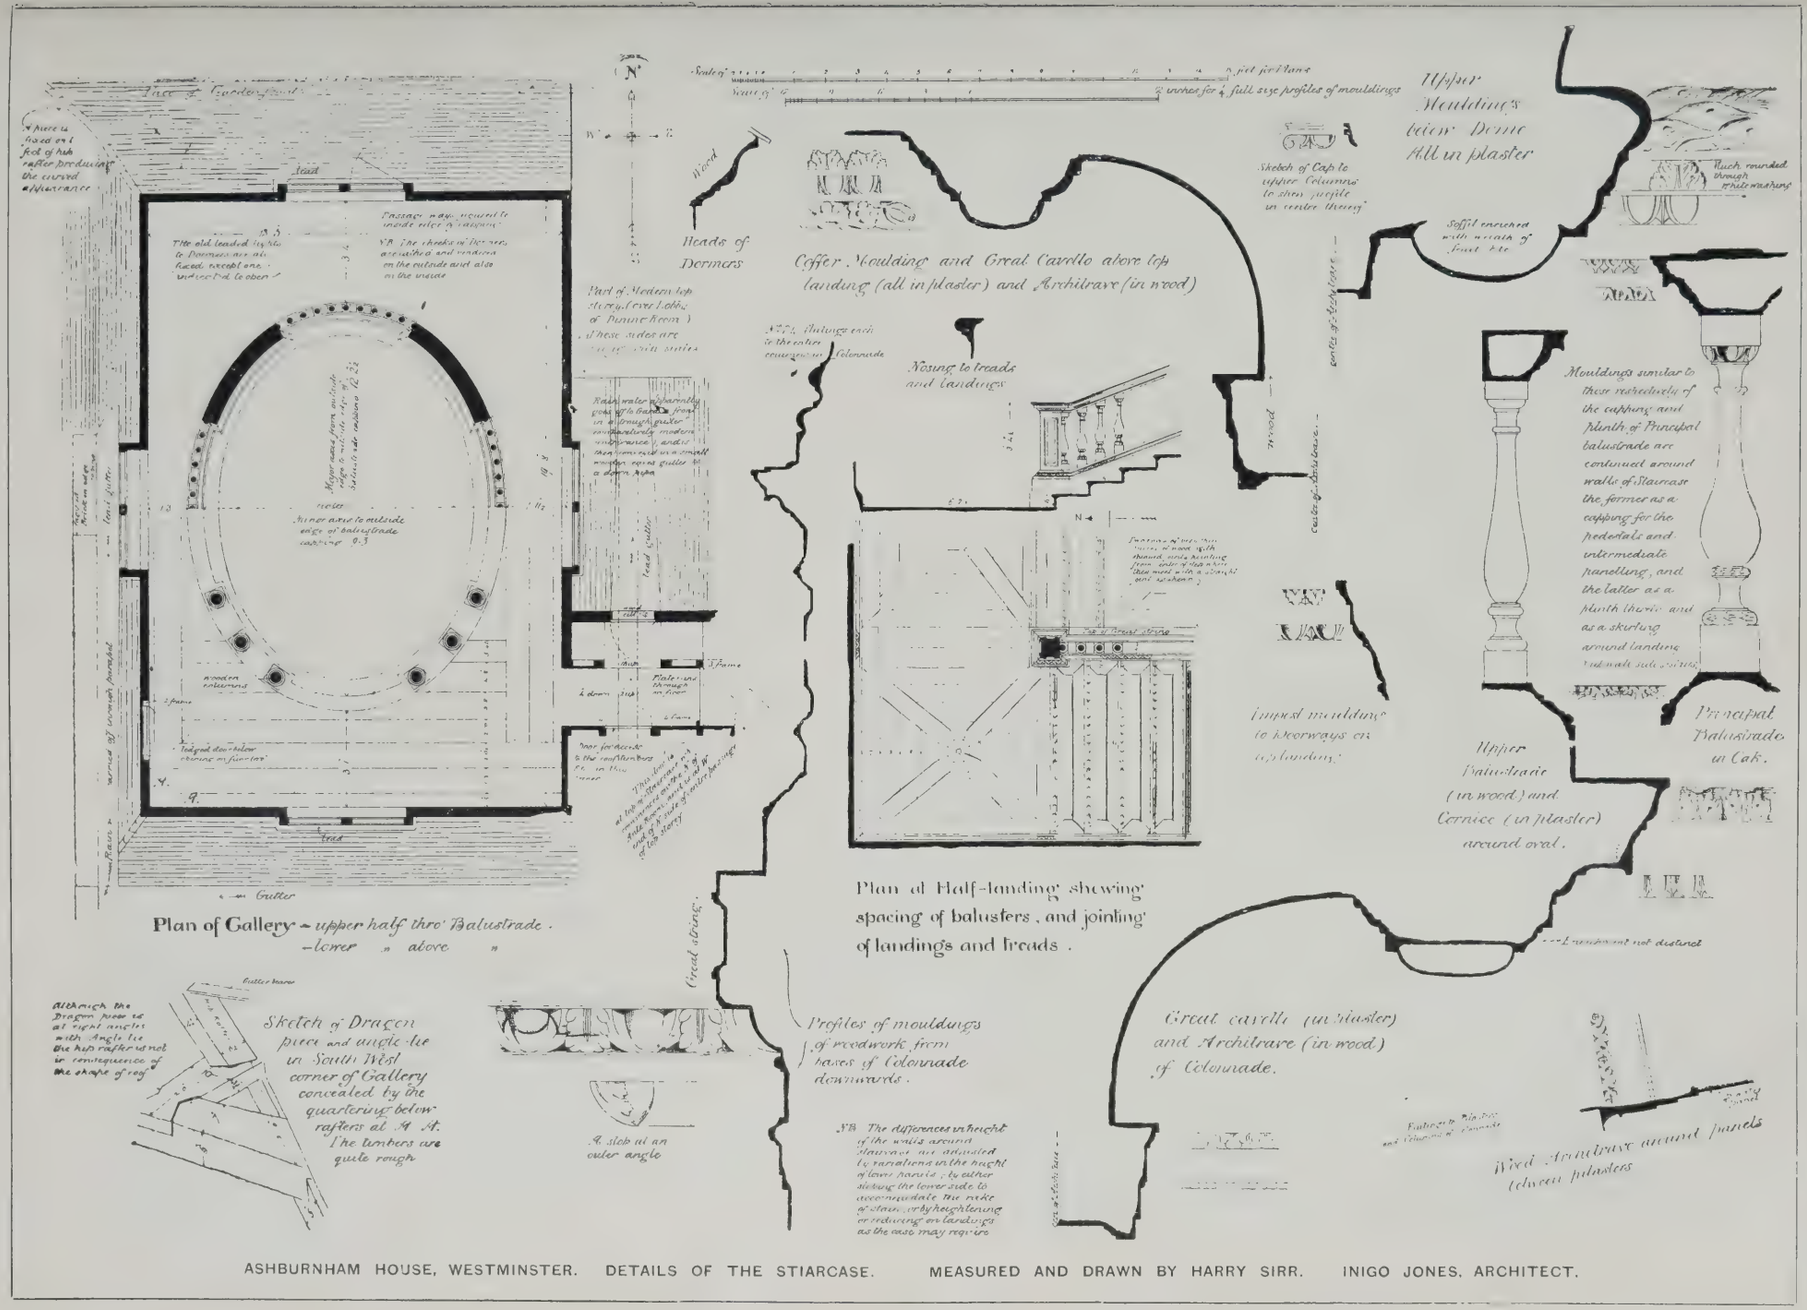
The other walls of Staircase are treated in a similar way to that shewn on the Section, the differences in height being adjusted in the panelling below Great String. On the North wall the two window openings take the place of the plaster panels in Colonnade; and, on the top landing the two Doorways, both of which have the same detail, except that the one leading to Dining Room has a semi-eliptical archivolt Etc:.

The Staircase appears to be mostly in Oak, but all the woodwork is painted white with the exception of the Balustrade and the skirting or wall string.



Section taken through upper part of Staircase - East to West - thro' centre thereof. (balustrade removed.)

Plan above great string.

EVENTS AND PERSONALIA OF THE YEAR AND RECENT IMPORTANT BUILDINGS.

THE ARCHITECTURAL PROFESSION AND ITS WORK IN 1908: A RETROSPECT.

Although, unfortunately, many architects are suffering from the effects of the financial stress which is now more or less affecting all classes of the community, yet the current year has witnessed the completion of numerous important buildings. For instance, among others, Town Halls or municipal buildings have been opened at South Shields (Mr. E. E. Fitch); Chelsea (Mr. L. Stokes); Ilkley (Mr. W. Bakewell); Ossett (Messrs. Hanstock and Sons); Holborn (Messrs. Warwick and Hall); Lambeth (Messrs. Warwick and Hall); Stockport (Sir A. Brumwell Thomas); Hull (Messrs. Russell and Cooper); Wallsend (Messrs. Liddle and Brown). Various ecclesiastical structures have been carried to completion during the present year, including the following churches, viz.:—St. Wilfred, Harrogate (Mr. Temple Moore); St. Hilda, Crofton Park (Messrs. Greenaway and Newberry); St. Luke, Bournemouth (Messrs. Hall and Holland); All Saints, Barry (Mr. Bruce Vaughan); St. Barnabas, Dulwich (Messrs. Oliver, Leeson and Woods); All Saints, Uplands, Gloucestershire (Mr. Temple Moore); All Saints, Hampton-on-Thames (Messrs. Greenaway and Newberry); St. John's, Ayres Road, Trafford, Manchester (Mr. R. B. Preston); Four Oaks, Birmingham (Mr. E. F. Reynolds); St. Luke's, Wimbledon (Mr. Jackson). The coping stone of one of the pinnacles, which completed Mr. Caröe's work of restoration on the Central Tower of Canterbury Cathedral was fixed by the Primate in April; and early in June the dedication took place of the north and south turrets and portal of the west front of Hereford Cathedral; whilst Hexham Abbey has undergone restoration under the direction of Mr. Temple Moore; and the Bell Tower of Chichester Cathedral under Mr. Somers Clarke.

Many new school buildings, of various types, have been opened, including the Municipal College, Portsmouth (Mr. G. E. Smith); Sir John Cass School, Aldgate (Mr. A. W. Cooksey); Okenrod New Council School, Rochdale (Messrs. Sykes and Evans); New Elementary School, Bedminster, Bristol (Mr. Dare Bryan); Edinburgh College of Art (Mr. J. M. Peddie); St. Alban's Grammar School new buildings (Mr. P. C. Blow); Halton Bank Schools, Pendleton (Mr. J. H. Woodhouse); Ruthneston Public School, Aberdeen (Mr. J. A. O. Allan); Council School, Kingsbridge, Glamorgan (Mr. W. T. Nash); Council School, Alma Road, Bournemouth (Mr. F. Lacey); County Schools for Girls, Richmond (Messrs. Garvis and Richards); Hemingford Council School, Birkenhead (Mr. J. T. Rees); High School for Girls, St. Alban's (Mr. A. L. Champneys); New Council School, New Brighton (Messrs. Edmunds and Kirby); Engineering Laboratories, Heriot-Watt College, Edinburgh; additions to Haileybury College (Messrs. J. W. Simpson and Ayrton).

Among the completed hospitals, infirmaries, and other works of a like nature are the following, viz.:—Colony for Epileptics, King's Heath, Birmingham (Messrs. Whitwell and Son); Cardiff Mental Hospital, Whitechurch (Messrs. Oatley and Skinner); Dingwall Sanatorium (Messrs. Ross and MacBeth); Dispensary, Cape Hill, Smethwick; Infirmary and Nurses' Home, Selly Oak, Birmingham (Messrs. Whitwell and Son); Maternity Hospital, Glasgow (Mr. R. A. Bryden); Fylde Union New Workhouse (Messrs. Heywood and Harrison); the New Royal Infirmary, Manchester (Messrs. Hall and Brooke); the Booth Hall Workhouse and Infirmary (Messrs. Worthington and Son).

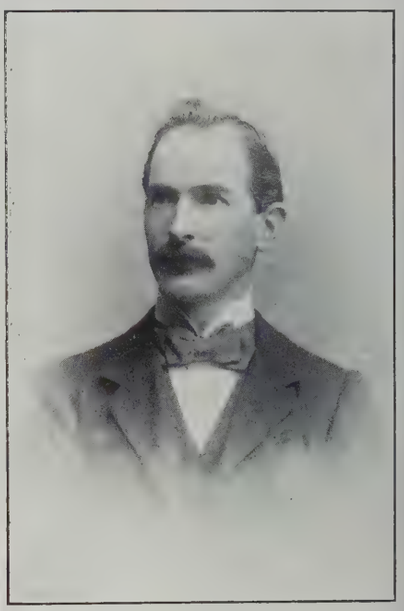
Public libraries have been opened at Hackney (Mr. H. A. Crouch); Belfast (Messrs. Watt and Tulloch); Southwark (Mr. Claude Batley); Reading, Islington Central and Branch Libraries (Mr. H. T. Hare); and a Library and Memorial Hall have been erected at Eton in memory of old Etonians killed in the South African war (Messrs. Hall and Greenslade).

Among the commercial and other buildings of a semi-public nature erected during the year are the following, viz.:—The Imperial Buildings, Rotherham (Mr. J. Platt); Refuge Assurance Co.'s Buildings, Oxford Street, Manchester (Mr. Paul Waterhouse); the Royal Insurance Co.'s building in Piccadilly (Mr. J. Belcher); the "Morning Post" offices (Messrs. Mewes and Davis); the New St. James' Hall, Great Portland Street, London (Messrs. Joseph and Smithem); Public Sea-water Baths at Seacombe; the New Waldorf Hotel in the Strand (Messrs. Marshall, Mackenzie and Son); a new Post Office at Birkenhead (Mr. W. Potts); Hornby Street Artisans' Dwellings, Liverpool; new premises for the British Medical Association, Agar Street, Strand (Messrs. Adams and Holden); new Post Office, Warrington (Messrs. Parkinson and Sons); the Hippodrome Palace of Varieties, Middlesbrough (Mr. G. F. Ward); tenement houses, Flaxman Terrace, St. Pancras (Messrs. Joseph and Smithem); residential flats at Albert Gate (Messrs. Hart and Waterhouse).

Having thus enumerated scome of the more important of the public buildings of the year, it may be of interest to briefly review the actions of the Royal Institute of British Architects during the past twelve months. In this connection it is a pleasure to state that there has been a very satisfactory increase in the membership of this the leading architectural society, which now includes 906 Fellows, 1,288 Associates, and 45 Hon. Associates within its ranks. Early in the year Mr. W. J. Locke, who had so ably carried out the secretarial duties of the Institute for the past eleven years, was compelled —to the great regret of all who knew him—to tender his resignation, and Mr. Ian MacAlister was duly appointed to fill the vacancy thus created. At the annual general meting held in May, it was announced that the Royal gold medal had been awarded to the well-known French architect, M. Honoré Daumet, in recognition of his work as an architect, and of his services in connection with the cause of architectural education. It was also stated that the revision of the Institute form of contract was contemplated, and that the following questions were under the consideration of committees appointed to report thereon to the Council, viz.: (1) The desirability of inserting some additional provision in the Institute form of contract in the event of the bankruptcy of the contractor; (2) the possible liability of a building owner under the Workmen's Compensation Act; (3) the L.C.C. General Powers Bill, 1908; (4) the question of professional advertising.

Notice was also given of some intended alterations in the intermediate and final examinations, under which, for the former, instead of papers on (1) classic ornament, (2) mouldings and ornament, (3) the orders, and (4) history of architecture, two papers for the future will be set on the following subjects, viz.:—(1) The general history of architecture, and (2) the purpose of architectural features in relation to the buildings in which they occur. In the final examination the papers on "Mouldings, Features and Ornament" will be re-modelled, and in the future the candidate must show his knowedge of the principles of architecture, their theory and application, not only by drawings but by an illustrated thesis upon the subject.

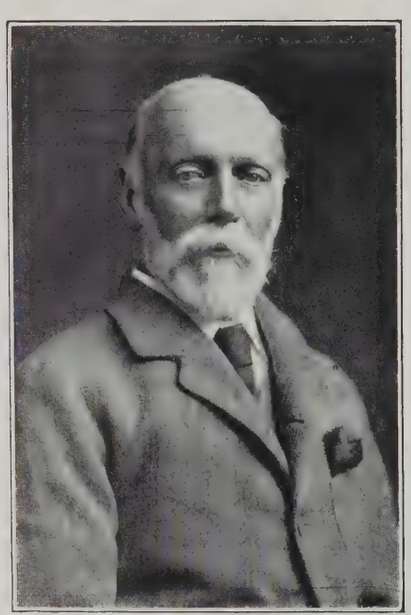
The very successful eighth International Congress of Architects was held in Vienna (May 18th—24th), under the auspices of the Austrian Committee and the leading architectural societies of that



MR. G. IAN MACALISTER, B.A., OXON.
Secretary of the Royal Institute of British Architects.
Mr. Macalister is receiving many Congratulations on his approaching marriage in January.

Mr. Leonard Aloysius Scott Stokes,

Vice-President.



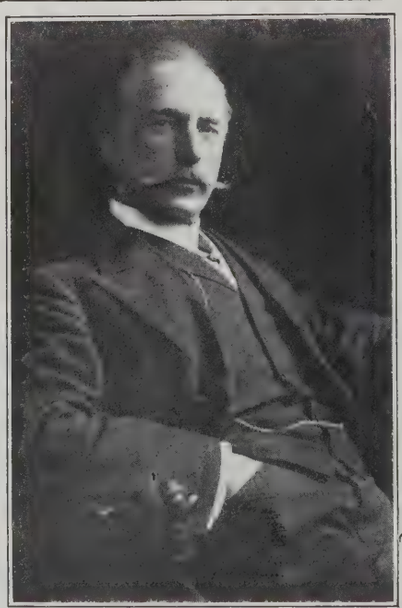
Born in Southport. Came to London in 1871, and was articled to S. J. Nicholl in 1874, and later spent some time with James Gandy, quantity surveyor. Pugin student, 1880. Has worked under G. E. Street, R.A., Thomas Collcutt, and Bodley and Garner. Is architect of many churches and domestic buildings, and his modern Gothic work is greatly appreciated. Has lately designed several telephone exchanges.

Mr. James Glen Sivewright Gibson,

Vice-President.

Born in Arbroath, Forfarshire. Came to London and entered the office of Mr. Wallace. There met Mr. S. B. Russell, whom he later joined in a long and famous partnership, since dissolved. Mr. Gibson's practice has been mainly in public buildings, and the firm of Gibson and Russell became famous in the annals of competitions. Among Mr. Gibson's recent works is Caxton House, Westminster.

Mr. Edwin Thomas Hall,



Vice-President.

Born Suffolk, 1851. Educated, South Kensington School of Arts; office of late J. Fogerty. Commenced practice, 1876. Professional work, churches, mission halls, mansions, public buildings, hospitals, including St. Ermin's Hotel, Westminster; head offices of the Metropolitan Asylums Board, Victoria Embankment; National Board, Victoria Embankment; Sanatorium, Frimley; New Royal Infirmary, Manchester, in conjunction with a Manchester colleague.

Mr. John William Simpson,

Vice-President.

Born 1858. The family have been practising architects for three generations. Educated at private schools. Articled to his father; admitted student of Royal Academy, 1878; passed first compulsory examination held for admisisson to R.I.B.A., 1882; membre de Comite, Permanent des Congress Internationaux des Architectes; architect of Roedean School, Brighton; and numerous private houses, studios, etc., throughout the country.

Mr. Ernest George,

President.

Born London, June 13th, 1839. Educated Brighton, Reading. R.A. gold medal for architecture, 1859; Queen's gold medal of the Royal Institute of British Architects, 1896. Articled to S. Hewitt; entered Royal Academy as student; began practice with T. Vaughan; at Vaughan's death was joined by Harold Peto, and on Peto's retirement by A. B. Yeates. Professional work: Stoodleigh Court, Devon; Rousdon, Devon; Motcombe, Dorset; Batsford, Gloucester; Edgeworth Manor, Gloucester; Monk Fryston, Yorks; Poles, Herts.; North Mymms, Herts; Buchan Hill, Sussex; Dunley Hill, Surrey; Welbeck Abbey; Eynsham Hall, Oxon.; Sedgwick Park, Sussex; Ruckley Grange, Salop; Busbridge Park, Surrey; Crathorne Hall, Yorks; Shiplake Court; Harrington Gardens; Mount Street; Collingham Gardens, S. Kensington; houses in Cadogan Square and Berkeley Square; Albemarle Hotel and Ossington, Newark; Church of St. Andrew, Streatham; St. Pancras, Rousdon, Devon; the churches of Samaden and Tarasp, in the Engadine; villa at Antibes, France. Publications: as an etcher—"Etchings on the Mosel," "Etchings on the Loire"; in Belgium; in Venice.

Photographs:—Mr. Ernest George and Mr Leonard Stokes, by Russell & Sons, London. Mr. J. W. Simpson by Histed, London. Mr. E. T. Hall by Lafayette, Ltd., Manchester and Mr. J. S. Gibson by Lowden & Son, Dundee.

SIR A. BRUMWELL THOMAS, F.R.I B.A.
Vice-President of the Architectural Association.

Photo: G. C. Beresford.
MR. WALTER CAVE, F.R.I.B.A.
President of the Architectural Association.

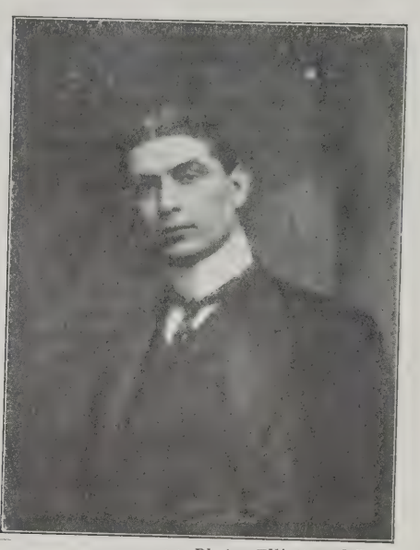


Photo: Elliott and Fry.
MR. HENRY TANNER.
Vice-President of the Architectural Association.

Photo: Whiteleys.
MR. D. G. DRIVER.
Secretary of the Architectural Association.

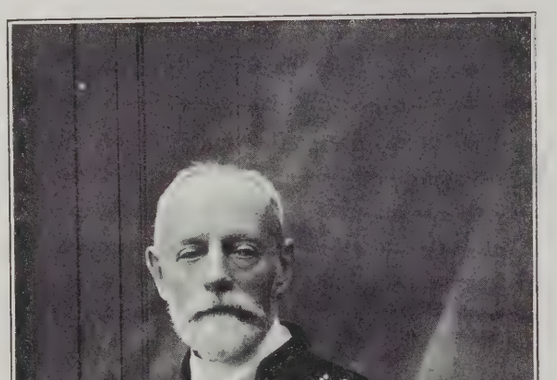
city, and its proceedings were duly reported in our columns. In July, through the influence of the R.I.B.A., the beautiful series of drawings executed by Mon. Jean Hulot, illustrating his conjectural restoration of the ancient provincial citadel of Selinus on the south-west coast of Sicily, were lent by the French Government for public exhibition at the gallery of the Royal Society of Painters in Water Colours. Among the competitions of the year, that for the proposed London County Hall, won by Mr. R. Knott, naturally overshadows all others. We have already drawn attention to the architectural poorness of the successful design, and to the numerous defects evinced in its planning, and no more need now be said on the subject. We must, however, reiterate our conviction that the London County Council is about to perpetrate one of the greatest of its many architectural blunders by the sanction it has given to the construction of a mean, insignificant, and entirely inadequate embankment roadway on the south side of the Thames. Other competitions include those for public baths at Castleton, Rochdale (won by Messrs. Wallis and Bowden); schools at Ellesmere Port, near Birkenhead (Messrs. Beacon and Horsburg); a cottage hospital at Hoylake (Messrs. Grayson and Ould); town hall at Radcliffe (Messrs. Gillow and Holt); a public hall and institute at Ainsdell, Lancashire (Mr. G. H. Willoughby); new schools at Eccles (Mr. H. Lord); libraries at Cradley Heath and Old Hill, Rowley Regis (Messrs. Wills and Anderson); new secondary schools for Market Drayton (Mr. J. Holt); new Liddle School and School of Art, Tiverton (Mr. W. H. Ashford); intermediate school for boys, Cardiff (Messrs. Teather and Wilson); Dudley Workhouse extension (Messrs. Nicol and Nicol); Abbey Road Schools, Oldbury (Mr. W. F. Edwards); new Council schools, Nantwich (Mr. H. Brown); secondary school, Brigouse (Messrs. Sutcliffe and Sutcliffe); technical institute, Colchester (Messrs. Jques and Newman); Free Library, Port Ellesmere (Messrs. Sproat and Warwick); Grammar School, Malton (Mr. W. H. Brierley); Free Library, Llangollen (Messrs. Teather and Wilson); isolation hospital, Salisbury (Mr. J. H. Goodman); secondary schools, Bromley, Kent (Mr. Burke Downing); workmen's dwellings, Chelsea (Messrs. Wills and Anderson); and the Glamorgan County Hall, Cardiff (Messrs. Harris and Moodie); the mention of the last-named competition recalls the undoubted fact that, had it been generally known that the President of the R.I.B.A. would refuse to nominate a suitable assessor for this competition, many architects would have been saved a considerable amount of labour and expense. As a matter of fact, the Institute's policy with regard to the conduct of architectural competitions is going from bad to worse. Time was when the legitimate grievances of competing architects were well safeguarded by the vigilance and energy of the Competitions Reform Society, for which the present competitions committee of the R.I.B.A. has proved anything but an efficient substitute.

THE ARCHITECTURAL ASSOCIATION IN 1908.

The principal work of this, the most active of our Architectural Societies, has been the extinction of the building debt occasioned by the Association's removal to its present quarters in Tufton Street. Another matter, which is of more social interest, is the development of the Athletic Club under the aegis of the President, himself well-known in the athletic world. The Athletic Club now embraces cricket, hockey, Association football, Rugby football, rifle, rowing, and swimming sections.

The Architectural Association School continues to progress, and affords a thoroughly good training. The general opinion of the Association officials with regard to the number of young men taking up the profession of architecture is, that there are no more entering the profession now than there were some years ago. The class of men they are at present training should prove an acquisition to the profession of architecture. The overcrowding of the profession, which is so apparent at the present time, is attributed to the general depression in the building trade; and consequently to a shortage of work amongst architects, many of whom have been obliged to dispense with the services of assistants for whom they have no work to do. The general register of assistants which the Architectural Association has kept open heretofore will probably have to be restricted to the use of their own members and pupils, as during the past year they have found the number of assistants want-

ing employment has risen to enormous proportions, and the inclusion of outsiders acted detrimentally to the interests of their members. Moreover a large proportion of these outsiders could not produce work which was really satisfactory, and the Association scarcely cares to take the responsibility of recommending them. It is the contention of those who are interested in the Architectural Association School that many of the assistants who are out of employment at the present time are not really fitted for the profession of architecture, and that they have been displaced by better and more highly trained men. We put forward this explanation in view of the articles we have recently published on the depression in architecture."



The Architectural Association play this year was a great success, and we learn that there is another play in preparation which will be produced towards the end of March next year. The Musical Society is flourishing exceedingly, and undertook the musical programme both at the play, and at the recent conversazione.

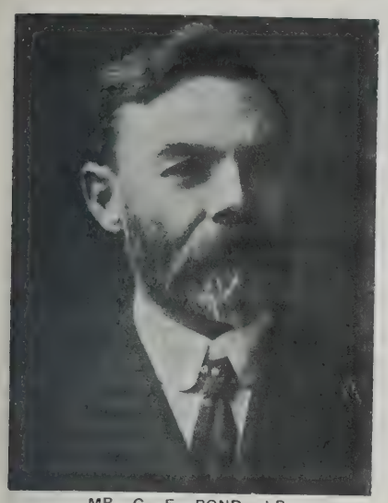
ROYAL INSTITUTE OF ARCHITECTS OF IRELAND IN 1908.

The Royal Institute of the Architects of Ireland holds the distinction of being the oldest architectural society in the United Kingdom, with the single exception of the Royal Institute of British Architects, which claims seniority by two years only.

The past session has been a particularly strenuous one for its council and members. New premises have been acquired for the purpose of providing adequate accommodation for the growing needs of the Institute. Its financial condition has been greatly improved, as the result of steps which have been taken by the council during the past year.

After very careful consideration, and consultation with the Architectural Association of Ireland, it has been decided to form a class of students in the Institute, admission to which will be by a qualifying examination, in order to afford an incentive for systematic and diligent study on the part of the architectural student.

M. HONORÉ DAUMET, ROYAL GOLD MEDALLIST, 1908.



His Majesty the King has confirmed the Institute the continued use of the term "Royal," a title which the Institute has enjoyed since the late Queen became its patron near 68 years ago. Steps have also been taken to incorporate the Institute under the Companies' Acts, and a new constitution has been drawn up and the by-laws completely revised.

MR. FREDERICK BATCHELOR, A.R.H.A., F.R.I.B.A.
President of the Royal Institute of Ireland.

THE SOCIETY OF ARCHITECTS IN 1908.

During the session expiring October 1908, 88 members, 2 hon. members, and 85 students were added to the register while three had been transferred to the retired list. Allowing for deaths, removals, and resignations, the total membership now stands at 975, an increase over last year of 132. The Society sustained a severe loss in the death of the President, Mr. A. Frank Vallance, F.R.I.B.A., who passed away on East Eve, after a few weeks' illness. His death deprived the Society of one of its most energetic and earnest supporters. Mr. E. J. Hamilton, of Brighton, past president, filled the vacancy for the remainder of the session. The Society's official journal has been reproduced in a new and improved form. The half-yearly examinations to qualify for membership were held in Manchester and London during October and April. The examination for the architectural scholarship, 1908, was held in London, Manchester, Edinburgh and Johannesburg in May, the winners being Mr. J. R. Leathart, of London, Mr. William B. Walton, of Blackpool won the travelling studentship competition, the subject set being a library on the open access system. The council is gratified to see the increasing use of the Society's library, for which a new catalogue has been published at a cost of 6d. In support of the principle of registration, an agreement has been come to with the Incorporated Association of Municipal County Engineers. Mr. L. Atherley-Jones, K.C., M.P., the hon.

MR. G. E. BOND, I.P.
President of the Society of Architects.

nember in charge of the Society's Bill in Parliament, was unfortunate in the ballot for private members' Bills, and it was herefore impossible to make any further progress with it during the present session of Parliament. The council opposed he London County Council General Powers Bill. The late Mr. R. F. Valance and the hon. secretary, Mr. Ellis Marsland, represented the Society at the ighth International Congress of Architects at Vienna in May. The gold medal f the Society was presented to Mr. A. . Pridmore, the immediate past president of the Society. The council has iven active support to the Architects' Benevolent Society, and also has subcribed to the committee for the survey f London. Visits were paid during the ear to the works of the Associated Portand Cement Manufacturers, at Swanscombe, Messrs. Walkers, Parker and Co.'s ead works at Lambeth, and the new Selridge Store building in Oxford Street. The lease of the Society's present preises having nearly expired, the council s in negotiation for permanent premises n Bloomsbury. The Society of Architects Masonic Lodge, which was formed year ago, has now become firmly stablished.

THE ABERDEEN SOCIETY OF ARCHITECTS IN 1908.

The work of the Society this session has en comparatively light. Owing to the revailing dullness in the architectural rofession, the business generally has been confined to work of a routine nature. mongst other matters, a course of lectres has, in co-operation with the Aberen Architectural Association, been instited for the benefit of architects' pupils nd apprentices, and a series of competions in drawing and design has also en started in connection with the architctural classes at Gray's Art School, izes being awarded by the Society to e winners of the competitions. An "at ome" was held at the beginning of the ssion in conjunction with the Associaon in the Art School, which was attended a large number of architects and their sistants, pupils and friends, when the I.B.A. prize drawings for the year were hibited, along with a selection of drawgs and engravings kindly lent by the oyal Institute.

The council of the Society have also is year revised the carpenter work mode

MR. JOHN RUST.
President of the Aberdeen Society of Architects.

of measurement for schedules of quantities, and have, in co-operation with the Aberdeen Master Carpenters' Association, amended and brought it up-to-date.

THE BIRMINGHAM ARCHITECTURAL ASSOCIATION IN 1908.

The Society has found a new home in the Exchange Buildings, in conjunction with the Photographic Society. The new rooms possess accommodation which has long been needed, and it is hoped that the extra spaciousness of the new quarters will induce more members to attend the general meetings and listen to the papers read. Among the interesting papers was that on "Competitions," by Mr. Herbert Wills, and Mr. Dixon's lecture on "Mediæval Sculpture in France." The meeting following was devoted to papers on two deceased architects, one a former president of the Association, and both for many years eminent members of the profession in Birmingham. Mr. Bidlake gave a lecture on "Towers and Spires"; Mr. Bulkeley Cresswell one on "The Architect's Client," which was of a humorous character. Among other interesting papers was that of Mr. Reynolds, on "Comparisons of Eastern and Western Architecture," on "Domed Churches," by Professor Beresford Pite, and on "Old Cottages and Manor Houses," by Mr. Jones. The work of the council during the past session presents a few points of general interest. Considerable progress has been made in the all-important matter of architectural education, and the council hopes shortly to present a complete scheme before the Society. For the coming session the Society have arranged a number of promising papers. Mr. A. S. Dixon lectures on "Early Roman Churches" on January 22nd; Mr. J. A. Gotch lectures on February 5th on the "Elizabethan House," and Mr. C. H. Holden will probably provoke discussion by his paper on "Aboriginality of Architecture," which is to be given on March 5th. A fund has been established for the increase of the library.

Photo: Lambert.
MR. MOWBRAY A. GREEN, F.R.I.B.A.
President of the Bristol Society of Architects.

CARDIFF, SOUTH WALES, AND MONMOUTHSHIRE ARCHITECTS' SOCIETY IN 1908.

The membership of the above Society for the year ending December 31st, 1908, comprises 35 members and 15 Associates. Competitions in design were held during the season 1907-8, and members of the council attended at intervals and inspected and criticised the works submitted therein, and as a result of the competitions prizes were awarded to Messrs. H. Norman Edwards and D. F. Ingleton. The Council of the Society during the past year has taken action in several matters of interest to the profession, both locally and generally.

MR .H TEATHER, F.R.I.B.A.
President of the Cardiff, South Wales and Monmouthshire Society of Architects.

Local preliminary and intermediate examinations for the Royal Institute of British Architects were held in Cardiff by the Society in June and November.

An exhibition of the R.I.B.A. prize drawings was held at the rooms of the Society from July 6th to 10th inclusive, and an exhibition of students' drawings sent down by the Society of Architects was also held in the same rooms from June 18th to 24th inclusive.

Both exhibitions were well attended by the members and Associates of the Society.

DEVON AND EXETER ARCHITECTURAL SOCIETY IN 1908.

This Society, founded in 1887, was allied to the Royal Institute of British Architects in the year 1891, and consists of about 90 members, divided into three classes, embracing the counties of Devon and Cornwall, with Exeter as its centre. The president for the present year is Mr. James Crocker, F.R.I.B.A., of Exeter, and the vice-president, Mr. W. H. May, M.S.A., of Plymouth, who with a council of twelve, form the governing body. The hon. secretary is Mr. Allan J. Pinn, A.R.I.B.A., of Exeter. The objects of the Society are, amongst other things, the general advancement of architecture and the various arts and sciences connected therewith. There is a small but useful and increasing library, and a prize is annually offered to students for measured drawings. The work of the year includes five papers, as follows:—"Reinforced Concrete," by Mr. Charles Cole, M.S.A.; "Some Notes on the Life and Works of Sir Charles Barry, R.A., F.R.S., by Mr. James Crocker, F.R.I.B.A.; "Some Modern Applications of the Orders," by Mr. C. J. Tait, F.R.I.B.A.; "Some Peculiarities in the Construction of Hollow Walls," by Mr. T. A. Andrews;

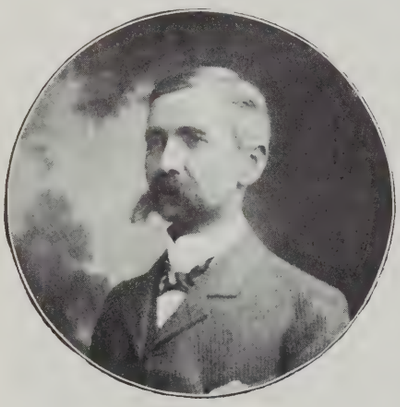

Photo: H. T. Jessop.

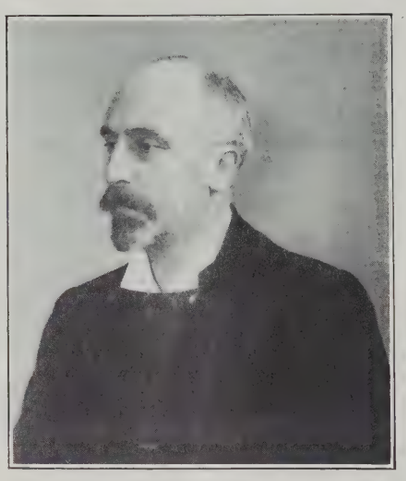


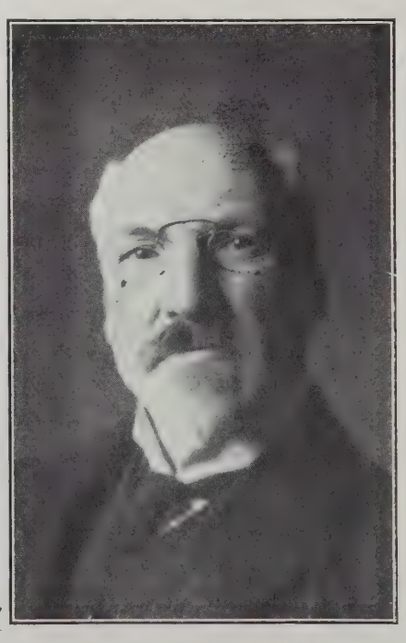
MR. JAMES CROCKER, F.R.I.B.A.
President of the Devon and Exeter Architectural Society.

"Hospital Planning and Construction," by Mr. J. C. Southcombe.

Many matters of professional importance have been discussed and dealt with from time to time, and the rules of the Society are at present under revision.

THE EDINBURGH ARCHITECTURAL ASSOCIATION IN 1908.

The inauguration of this, the jubilee session, was marked by two events of considerable importance in the history of the Association. The first of these was the architectural exhibition held during the summer months of 1907. This exhibition comprised works extending over a period of 60 or 70 years, collected from all parts of Scotland. This was the second exhibition promoted by the Association, an earlier one having been held 25 years ago. Another event in the 1907-8 session was the visit of the Royal Institute of British Architects to Edinburgh in July last year, when the annual meetings took place. The visit commenced with a reception by the Lord



MR. JOHN T. MACLAREN.
President of the Dundee Institute of Architects.

Provost and magistrates in the City Chambers on the evening of July 4th. The annual dinner of the Institute took place on the Friday evening, and on Friday and Saturday a number of visits were made in Edinburgh and district under the auspices of the Association. A visit was paid by the Institute to the Architectural Exhibition.

The session's work comprise 16 meetings and visits. The address at the opening meeting was delivered by the Right Hon. Lord Kingsburgh, K.C.B., L.L.B., the subject being "Incongruities and Disfigurements." This address was published in booklet form and circulated throughout Scotland, copies being sent to the Corporations of the principal towns and to various Associations.

The session closed with the annual excursion on July 4th, 1908, to Holy Island, where Lisdisfarne Priory, St. Mary's Church, and Lindisfarne Castle were visited.

A golf club in connection with the Association was inaugurated, three outings being held during the session. In addition to performing the usual routine business, the council published the report of a special committee upon the condition of the Chapel Royal, Holyrood. The Associate section had a successful session during which 12 meetings and visits took place, and the usual studentship design competitions were held.

MR. JOHN WATSON, F.R.I.B.A.
President of the Edinburgh Architectural Association.

THE GLASGOW INSTITUTE OF ARCHITECTS IN 1908.

During the past year the Institute, as usual, took charge of the local examinations of the Royal Institute of British Architects.

The subject of international competitions was brought before the Institute by the R.I.B.A. The various articles for the regulation of these competitions were approved, but it was suggested that a larger representation of the country promoting the competition should be allowed.

The provisions of the Town Planning Bill were considered. These were approved of generally, but the Institute thought that the benefits the Bill is likely to confer would be increased and the danger of maladministration lessened by the inclusion of clauses providing for (1) the creation of locally-appointed committees of experts to whom the town planning schemes should be referred, and whole suggestions should be submitted to the Local Government Board; (2) specific permission for the Royal Institute of British Architects to appear before and make representations as "persons affected" at inquiries held by the Local Government Board before the approval of town planning schemes. The Institute has appointed a committee to co-operate with the R.I.B.A. Committee in the matter.

Photo: Warnenke

MR. GEORGE BELL, F.R.I.B.A.
President of the Glasgow Institute of Architects.

The Institute has agreed to co-operate with the R.I.B.A. in the compilation of a measured record of buildings in the United Kingdom suitable for study, and especially in the case of those of which no adequate record exists.

An exhibition of the competitive designs submitted by architects in Glasgow and neighbourhood (in whose number all the premiated designs were included) for the

Photo: Grun and Swan
MR. T. E. ECCLES, F.R.I.B.A.
President of the Liverpool Architectural Society.

Perth City Hall, was held in the Institute rooms in April last, and was well attended by architects and others. The Institute has decided to hold from time to time exhibitions of designs, submitted by members and others in competition, of sufficient importance, where either no public exhibition of the designs generally has been held by the promoters or the exhibition is too far from Glasgow to be readily accessible.

A circular has been issued to all architects in the province of the Institute calling their attention to the new constitution of the Institute, which now embodies a wider class of members as a result of its amalgamation with the Glasgow Architectural Association, and asking them to bring the question of their joining the associate section of the Institute before their apprentices and assistants. As the result of this amalgamation, the membership of the Institute now amounts to 225, of whom 85 are Fellows, 79 Associate members, 22 Student members, and 39 Lay members. In the first category are included nearly all within the district possessing the necessary standing and qualifications.

The Associate section continues as formerly to hold regular meetings in the rooms of the Institute, for the delivery of lectures, etc., and an interesting syllabus of papers and visits to works of interest is in course of being carried out.

MR. PERCY ROBINSON, F.R.I.B.A.
President of the Leeds and Yorkshire Architectural Society.

LIVERPOOL ARCHITECTURAL SOCIETY IN 1908.

It is now the 61st session of this Society. The present membership consists of 56 Fellows, 69 Associates, and 23 students, presided over by Mr. T. E. Eccles, F.R.I.B.A. The papers to be read are as follows:—

January 4th, 1909.—Paper by Thos. H. Mawson, Hon. A.R.I.B.A., "The Peace Palace at The Hague," with special reference to the park and gardens. (Illustrated by lantern slides and drawings.)

January 18th.—Second members' meeting. Paper by T. Faulkner Shepheard, "Competitions."

February 1st.—Fifth ordinary meeting. Paper by Mervyn E. Macartney, F.R.I.B.A., "The Three Churches of St. Paul." (Illustrated by lantern slides and drawings.)

February 15th.—Third members' meeting. Paper by T. T. Rees, F.R.I.B.A., "The Liability of Architects to Clients and Public."

March 1st.—Sixth ordinary meeting. Paper by E. Guy Dawber, F.R.I.B.A., "Materials and their value in relation to Domestic Architecture." (Illustrated by lantern slides.)

April 5th.—Annual general meeting.

The meetings, ordinary and members, are held respectively on the first and third Mondays of the month, the attendance averaging about 45. The students' prizes offered for competition by the Society have consisted of a travelling studentship, value £30, subscribed by members of the Society, and two prizes of £3 and £2 each for design, and two prizes of similar amounts for measured work. The improved financial state of the Society has enabled the council to slightly increase the expenditure upon the library, and to make a donation to the Architects' Benevolent Society.

MANCHESTER SOCIETY OF ARCHITECTS IN 1908.

The total membership is now 257, consisting of 109 Fellows, 89 Associates, and 59 students. Among the forthcoming papers is one on "The Architect's Use of Photography," by Mr. J. R. Wigfull, on January 9th, and "The Grand Manner in Architecture," by Professor C. H. Reilly, on February 13th. During the summer the summer the Society paid visits to the Co-operative Insurance offices, the telephone exchange, the Stockport Town Hall, the Royal Infirmary, the Christian Science Church, Hulme Hall, and the G.P.O. sorting office, the last being constructed entirely in reinforced concrete. During the year some 23 volumes have been added to the library. The club nights during the year have been well attended. The work of the council during the past session presents few points of general interest.

Photo: Lafayette, Manchester.
MR. PAUL OGDEN, F.R.I.B.A.
President of the Manchester Society of Architects.

THE NORTHERN ARCHITECTURAL SOCIETY IN 1908.

This Society now numbers 253 members, made up of 84 full members, 86 Associates, and 83 students. During the year excursions have been made to Sunderland, to the new church at Roker, and the pier works, to the municipal buildings at South Shields, the County Hall at Northallerton, and to the Abbey Church at Hexham. Papers read during the year were by Mr. de Coleville (in the unavoidable absence of Mr. Moritz Kahn) on "Reinforced Concrete"; by Mr. Joseph Oswald, on "The Glory that was Greece"; on November 11th the president's address, and on December 2nd a paper by Mr. C. C. Hodges on "Norman Architecture in the Northern Counties of England." The council regret the general depression in the building and allied trades and the small prospect of immediate improvement. They have felt it their duty to the ratepayers, broadly, and to the profession, personally, to strongly protest against the institution of the large, costly, and permanent architectural staff set up by the Newcastle Cor-

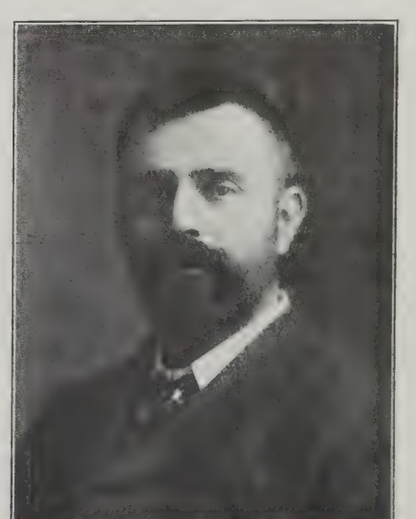


Photo: J. F. Forde.

President of the Northern Architectural Association.

poration, knowing that if public work was placed in ordinary competition the ratepayers and the art of architecture would be benefited; that with the employment of private firms the cost would cease on the completion of the work, whereas the cost of a permanent staff never ceases, and architects who are all ratepayers are contributing to funds, the effect of which is causing their unemployment.

THE NOTTINGHAM ARCHITECTURAL SOCIETY IN 1908.

This Society had on March 21st two hon. members, 39 members, and 41 Associates. The annual dinner took place at the George Hotel on Monday, February

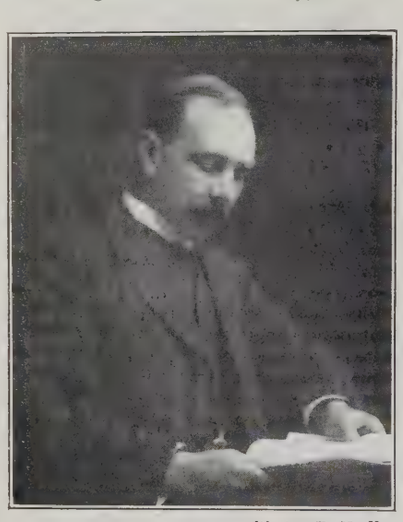

Photo: E. Hadley.
MR. A. ERNEST HEAZELL, F.R.I.B.A.
President of the Nottingham Architectural Society.

24th. An exhibition of the R.I.B.A. prize drawings was, by kind permission of Mr. G. H. Wallace, the curator, held at the council museum. The council regrets that the attendance at the general meetings has been particularly poor. It is to be hoped that more interest will be taken in the papers read on future occasions.

THE SHEFFIELD SOCIETY OF ARCHITECTS & SURVEYORS IN 1908.

Perhaps the three subjects which have most interested the members of this Society during the past year are: Building by-laws, architectural education, and the appointment of an official architect for the city.

After no less than seven years' deliberation on the part of a sub-committee, the City Council proposed to formally make new building by laws. These were of the usual cast-iron type, and contained many requirements most unsuitable for universal application in an area, which, in spite of the efforts of speculative property owners and builders, is still largely open country. From time to time this Society has made suggestions to the framers of the by-laws, mainly with a view to the elimination of fads, and the desirability of the inclusion of modern and up-to-date methods of construction, especially in regard to timber sizes and the use of reinforced concrete, but the final result is yet to be seen.

The year has seen the opening of a Department of Architecture at the local University. The movement has received a fair and growing measure of support, and the Department gives promise of exercising a decided influence on the training of young men entering the profession. For a period of three years the Society has guaranteed the University against loss on the Department, which shows that the members of the profession in this district have the courage of their convictions.

With respect to the third and last item mentioned above, the Society made a strong protest against the whole of the public work of the city being placed nominally in the hands of one man, however eminent and capable he might be. While recognising that certain classes of work must be carried out by officials, it was urged that to carry out all public work of whatsoever nature, in this manner, was not conducive to variety or freshness of design. Such an argument made no appeal to the City Council as a whole; "economy" was the cry, as if an official, of necessity, must carry out a building at less cost than a private practitioner, even when the latter's 5 per cent. is included. So the official architect has been appointed, and architects in private practice are urged to console themselves with the statement that a saving in the rates will be effected in which they, as ratepayers, will benefit indirectly, even if they lose a good slice of the work which enabled them to pay the said rates.

MR. THOMAS MONKMAN.
President of the York and Yorkshire Architectural Society.

THE QUANTITY SURVEYORS' ASSOCIATION IN 1908.

The main work upon which this Association has been engaged is the consideration of the question of "uniformity of measurement." Encouraged by the immense success which has attended the labours of the Engineering Standards Committee, the Council considers that the time has now arrived when some attempt should be made to evolve a standard system of measuring and classifying the principal items which occur in nearly every bill of quantities. The formation of several provincial Associations, each of which adopts methods which vary considerably one from another, and all from

MR. ARNOLD E. HARRIS, J.P., F.S.I,
President of the Quantity Surveyors' Association,

the London system, renders this work imperative, and that no uniform system of measurement has hitherto been in existence is a fact which is deplored at every meeting of an architectural society, or at any meeting of an Association allied to the National Federation of Building Trades Employers, at which the question of quantities is under discussion.

Recognising that the appointment of a separate committee to deal with the question of standardising the measurements of each particular trade (a somewhat similar course to the one adopted by the Engineering Standards Committee referred to above), is rather a difficult undertaking for so young an Association, the Council has elected one committee, which is for the present dealing with one of the minor trades. This committee is now engaged in collecting evidence upon the method of measuring adopted in this trade in various provincial centres, and in interviewing delegates from representative bodies interested therein, and as a result of its labours it is believed that a uniform system, acceptable to all those whose interests are affected, will be evolved. Another important matter which the Council has had under consideration for the past twelve months is the terms of contract into which a quantity surveyor is generally required to enter when employed direct by a public authority. Some few of the more important public bodies, the London County Council and the Asylums Board, for instance, which have many building works on hand, and are in the habit of frequently employing a quantity surveyor, possess recognised forms of contract which have been in operation for some years past, but, with these exceptions, for each separate appointment a special contract has to be prepared.

This document is, more often than not, drawn up by the clerk to the authority, who is utterly unacquainted with the intricate and complicated nature of the quantity surveyor's work, and it as a rule contains some stringent clauses which operate rather more favourably to the employer than to the surveyor. The Council, recognising that the cost of the greater part of the building and engineering work which is undertaken by public authorities is met by loans sanctioned by the Local Government Board, deemed it expedient to approach that department on this question, and as a result of their representations the Council hopes that the agree-

ment upon which it is believed the Local Government Board will insist, will contain clauses under which the quantity surveyor's interests are safeguarded.

The Association is to be congratulated upon a considerable increase of membership, during the past year many leading members of the profession who had hitherto refrained from joining having now done so; the fact that the support of some of those who were originally opposed to its formation has now been secured is a striking testimony to the useful work the Association is doing for the profession. Any applicant for admission as a member must in the future pass either the Association's examination or have passed some examination which the Council shall consider equivalent.

OBITUARY, 1908.

Mr. J. B. Colson, F.R.I.B.A., architectural surveyor to the Dean and Chapter of Winchester Cathedral, died on January 21st, in his 55th year.

Mr. E. W. Mountford, F.R.I.B.A., died in London on February 6th. He was born at Shipston-on-Stour, Worcestershire, in 1855. Mr. Mountford held a foremost place among the profession as a designer of municipal buildings. He won the Sheffield Town Hall competition in 1890. His chief work is the new Central Criminal Court. He left estate valued at £23,239.

Sir James Knowles, M.C.V.O., died at Brighton in February. Some of his work included the Thatched House Club Building, Kensington (now pulled down), and the gardens in Leicester Square. He was the founder and editor of the "Nineteenth Century."

Mr. D. R. Dale, F.R.I.B.A., of London, E.C., died on February 29th, aged 71.

Mr. W. O. Callender, founder of the firm which is now the Val de Travers Asphalte Co., Ltd., and of Messrs. Callender's Cable and Construction Co., Ltd., died recently at Bournemouth, in his 81st year. He was a pioneer in the development of asphalt for roadways.

Mr. S. P. Rees, A.R.I.B.A., of London, E.C., died in March.

Mr. John Leslie died on March 18th at his residence in Knowsley, Liverpool. He was 82 years of age, and was for 35 years architect and surveyor to the Earl of Dudley.

Mr. Ernest Carritt, A.R.I.B.A., F.S.I., died in London on April 16th.

Mr. G. Gard Pye, a past vice-president of the Society of Architects, died on Easter Sunday, aged 59.

Mr. J. J. Stevenson, F.S.A., F.R.I.B.A., died in London in May, aged 77. He designed many large houses in the West-End, commencing with the Red House, on Bayswater Hill. His work at Cambridge included the new buildings at Christ's College, and the University Laboratory. Mr. Stevenson was the author of "House Architecture."

Mr. Herbert Davis, F.R.I.B.A., a past president of the York and Yorkshire Architectural Society, died on May 13th. He was 37 years of age.

Mr. A. E. Gough, A.R.I.B.A., of the firm of Giles, Gough, and Trollope, died from apoplexy, aged 66.

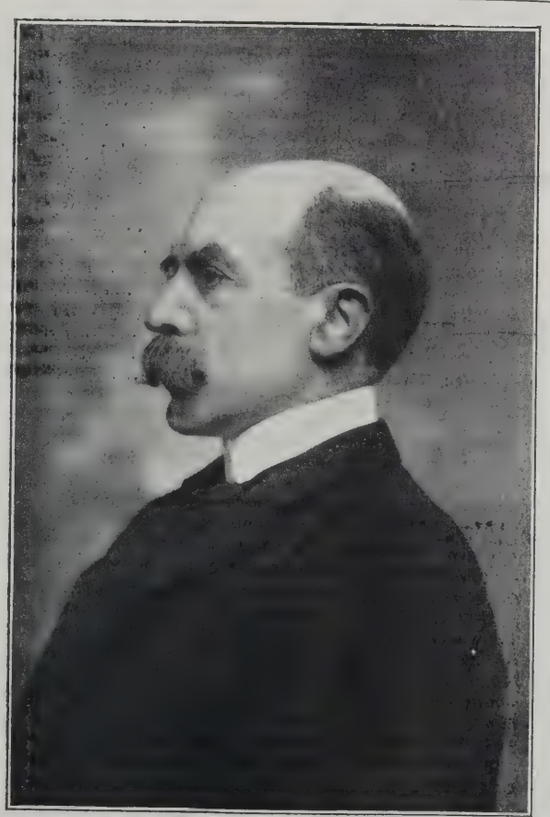

Photo: Elliott & Fry.

THE LATE E. W. MOUNTFORD, F.R.I.B.A.

THE LATE H. H. STANNUS, F.R.I.B.A.

Mr. F. H. Oldham, F.R.I.B.A., architect, of Manchester, died on June 30th. He was twice president of the Manchester Architectural Association before its amalgamation with the Manchester Society of Architects.

Mr. Alfred Darbyshire, F.S.A., F.R.I.B.A., died on July 5th, at his residence, Chatham House, Flixton, in his 70th year. His reputation is chiefly that of a theatrical architect.

Mr. R. Clifton Davy, architect, of Maidenhead, died in May, aged 57. He carried out many buildings in the town. His chief successes, however, were achieved in domestic work.

Mr. H. H. Stannus, F.R.I.B.A., A.R.C.A., died at Hindhead, Surrey, in August. He wrote the life of the eminent sculptor, Alfred Stevens. He was an active and a distinguished member of the R.I.B.A.

Mr. Leonard Judge, architect, died suddenly on August 26th, aged 26.

Mr. Leslie Green, F.R.I.B.A., died at Mundesley-on-Sea on August 31st, at the age of 34.

Mr. John William Lotherington Whitfield, architect of Hull, died suddenly on August 22nd. He was 53 years of age.

Mr. Edward Hodkinson, architect, of Chester, died on September 14th. He designed many notable buildings. He was a well-known member of the Chester and North Wales Archæological Society.

Mr. Thomas Winn, architect, of Leeds, died in October at Headingley.

Mr. Francis Adams Sprules, A.R.I.B.A., of Sheffield, died on Scawfell on October 15th. He was 27 years of age.

Mr. Lewis Henry Isaacs, F.R.I.B.A., of Bayswater and Gray' Inn, died suddenly on October 17th, at the age of 78. He designed a great many buildings in London, including the King Lud Tavern and Holborn Viaduct Hotel and station.

Mr. Edward Taylor, architect, of Bootham and York, died suddenly. He designed a large number of Wesleyan chapels in the York district. He was 78 years of age.

THE NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS AND ITS WORK IN 1908.

Origin.

The National Federation owes its origin to the need that was felt by the Trade for some better means of resisting Trades Union demands. Its existence was of course only made possible by the previous growth of local Associations of Employers in various parts of the country.

The rise of Building Trade Employers' Associations dates from and was consequent upon the rise of Trades Unionism. They were a purely defensive measure intended to protect their members from the often tyrannical restrictions which the early Trades Unions sought to impose on Employers of labour, and to curb the tendency they exhibited to resort to strike methods on the slightest or on no provocation. At first, like the Unions they were purely local bodies, generally confined to specific trades, because it was at that time customary in many parts of the country to let contracts to each branch separately, there bing no general contractor employed.

The workmen soon began forming alliances or federations of the various branches of the Building Trade in large industrial centres, and this was followed by the formation of the National Federations of Trades Unions having head-quarters mostly in London, and exercising control over each branch trade throughout the country.

The employers now found themselves faced by a very effective instrument of coercion in these federated trades unions; acting from the centre and having a common policy, the unions had only isolated local Associations of Employers to overawe or coerce, and it was their policy to allow their local branches to constantly formulate demands for higher wages, or more favourable conditions of labour, and if a strike resulted, the local men had the financial support of their fellows throughout the country, provided they had acted with the consent of their central committee.

The employer thus fought under great disadvantages, it was easy for the unions to denude a strike centre of the labour and draft it off to other localities; indeed, they used to thus denude a district in anticipation of a strike. Non-union men also were difficult to get, and very often unsatisfactory when obtained, and easily induced by the men's pickets to go away again.

Employers in other districts rendered practically no assistance worthy of the name but on the contrary would often come into the strike area, and carry out work under the eyes of their fellows who were fighting the men; the Employers local Associations were only supported by a few of the more farseeing employers, and these suffered severely in strikes by their foremen setting up as masters and capturing their late employer's clients, or by outside employers in the locality giving way to the men's demands in order to take advantage of the situation to their own profit.

Under these circumstances strikes were often long and bitter struggles lasting months, and leaving behind them an aftermath of enmity between masters and men, and between fellow employers.

Indeed, after such a struggle it was a usual thing for employers to pass their fellow employers in the street without a word or sign of recognition, and it was often hard to say whether an employer held in greater detestation the delegates of the workmen, who had triumphed over him, or the fellow employer who had treacherously betrayed the interests of his class.

As it is obvious that even trades unions cost money to run and maintain, it follows that it was in large industrial centres where funds were obtainable that the unions took root and flourished, and accordingly it was in these localities that employers first began to grapple with the new order of things which had arisen; they first tried to form strong local Associations, but with very unequal success; during labour troubles the membership would augment rapidly, but during peaceful times it quickly fell away again; employers saw no use in their Association except when a labour war was on.

Formation.

The first successful attempt at an improved and extended organisation was the formation by the leading local Associations in the country of a National Association of Master Builders, due to the initiative of the following cities and towns, representatives from which attended the preliminary meeting held at the Great Western Hotel, Birmingham, on December 18th, 1877, viz.:—

London, Liverpool, Manchester, Birmingham, Leeds, Bristol, Wolverhampton, Bradford and Leicester.

Among present members of Council, the following attended the first meeting, viz.:—Mr. John Bowen (Birmingham) and Mr. W. Nicholson (Leeds).

Among those present on that occasion the following subsequently became well-known for their active advocacy of National action:—Messrs. Stanley G. Bird, of London; Ed. Hughes, of Liverpool; J. S. Neill, of Manchester, shortly succeeded by his son, Mr. R. Neill; W. Southern, of Manchester; W. Sapcote, of Birmingham; W. H. G. Cowlin, of Bristol; W. Tomkinson, junr., of Liverpool.

From a statement by the Chairman at that meeting it appears that this attempt at organisation emanated from Manchester, but Colonel Bird, in his address to the meeting, referred to an attempt to

MR. ERNEST J. BROWN, Senior Vice-President.

MR. S. SMETHURST, J.P., Junior Vice-President.

MR. A. G. WHITE, National Secretary.

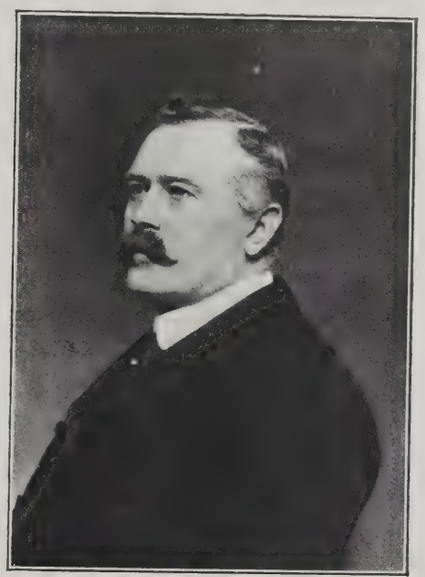
promote a National Association made some years previously which had met with but a lukewarm reception, the struggles of the past few years had, however, revived the idea and roused the spirit which resulted in this meeting.

Referring to the masons' strike then existing in London, he mentioned that the migration of operatives six months prior to the strike was so great that when the strike began the supply of labour was below the demand for it. He also referred to the question of the need for apprentices; and for the establishment of provident societies in London which should offer inducements to workmen to discontinue Union Societies.

First National Association of Builders.

The preliminary meeting decided that it was desirable to form a National Association of Builders; rules were drafted, and at a general meeting held at Crewe on January 23rd, 1878, the Association was formally constituted and the rules adopted, nineteen towns being represented.

The principle adopted was direct affiliation of local Associations to the central body, and as a bluff to the Trades Unions it had certainly some effect; but the scale of contribution was too small to make the central body really efficient, and there was not sufficiently constant intercourse between it and the local Associations to maintain that livel interest in one another which is the life-blood of such organisations.



Its Work.

Nevertheless, this first attempt brought leading men together from different parts of the kingdom. It lead to interchanges of ideas, and fostered the growth of an ideal. Men began to suggest many directions in which work for the benefit of the whole industry might be undertaken. A beginning, for instance, was made with the advocacy of a National Form of Conditions of Building Contract, a most important and urgently needed reform, because at that time architects were a law unto themselves in the matter of the conditions and forms of contract to which they compelled builders to subscribe, and gross injustice was frequently perpetrated in this way. A Mutual Insurance Company was formed to protect employers against the extravagant rates demanded by the tariff insurance companies as premiums for workmen's compensation risks. This and other good work of a similar kind was all very well, but the organisation was primarily intended to fight, if necessary, a national fight against aggressive Trades Unions, and as such was not a success.

The Beginning of Federation.

Meanwhile, the Lancashire building trade employers had taken what proved to be a step of the first importance by forming a County Federation of all the principal local Associations in Lancashire, some 20 to 30 in number. They adopted the federal system of local autonomy for local Associations, with limited powers conferred upon the federal body which could only act federally; representation was according to the number of members in each Association. The federal body consisted of an exective council, composed of the representatives sent up on the above basis by the local Associations, and this Council met quarterly, or oftener if required. For practical convenience an Administrative Committee of some dozen members was formed from the executive council, and exercised delegated powers during the periods between the quarterly meetings of the executive. The Administrative Committee met once a month, or oftener if required. Most important step of all, a secretary (Mr. Tomlison) was appointed, who proved to be a man of great executive and organising ability, and by his grasp of the principles of federalism and his businesslike methods, rapidly brought this new model of organisation into a condition of efficiency such as had not previously been dreamed of.

The frequent and regular meetings, the promptness of action, the proper management of finance, a fair apportionment of expenses among the Associations so that each contributed according to membership, a useful insurance scheme on economic lines, a federation form of contract and sub-contract, and much voluntary missionary effort by earnest men, who spared neither time or money in travelling about and advocating the new scheme. All these things produced such a growth of membership, such improved relations between employers themselves, and such a powerful effect upon the Trades Unions that there is small wonder that when the National Association realised, as it had to do after the plasterers' strike, that it must re-organise, it was towards the Lancashire system that all eyes were turned.

MR. JAMES CARMICHAEL,
President of the Institute of Builders.

The Northern Centre.

Lancashire, not content with well-doing within her own borders, had annexed Cheshire, and Yorkshire had established a sister federation, likewise the North Eastern Counties, and negotiations were on foot to form a Northern Centre combining these three organisations on federal lines, where a national re-organisation scheme was also brought forward.

A National Federation Scheme.

After considerable discussion, a national scheme of federal organisation was adopted, which in principle obtains yet, but which has successively been elaborated into the constitutions and rules under which the Federation now acts.

It may be of interest to refer to the objects of the Federation, and indicate briefly how these are being carried out.

The Objects of the Federation: How Carried Out.

A careful supervision is exercised by the County Federations over proposed new rules and working agreements, and a general policy followed.

By agreements with the leading trades, disputes are submitted to conciliatory methods before resorting to a strike or lock-out. Where questions of principle are involved which have to be tested in the law courts, the Federation grants financial assistance. When all other methods fail, the Federation may order a partial or total lock-out. It is satisfactory to record that since the plasterers' dispute in 1899 methods of conciliation have sufficed to settle such disputes as have from time to time arisen.

The federation of local associations into centres has been dealt with.

Co-operation with other Associations has taken place from time to time, while a permanent affiliation to the Employers' Parliamentary Council, a body representing various industries, enables the Federation to keep in touch with Parliamentary questions affecting industry, and to make its wishes known to Ministers or members of the House.

The watching of legislative measures likely to affect the building trade is acted upon as a Federation, as well as through the Employers' Parliamentary Council. Members of Parliament are interviewed, both in the House of Commons and through their constituencies, and through them opposition is offered to legislative measures or amendments moved, while the Government departments, such as the Post Office, Board of Trade, Home Office and the like invite the Federation to supply representatives on Departmental Committees of Enquiry, or afford opportunities for members of the Federation to tender evidence upon matters relating to the building industry.

A reserve fund is in process of creation. It is subscribed to by the Federations on basis proportional to wages paid, and is invested through trustees and all interest compounded.

The formation of new Associations is actively pursued by the various County Federations, assisted by the National secretary wherever and whenever opportunity serves.

A long series of negotiations carried on first by the old National Association of Builders and afterwards by the kindred Builders' Institute has resulted at length in an agreed form of contract issued by the R.I.B.A. in agreement with the Builders' Institute and this Federation.

The Federation, through its local Associations and by direct representation, is pressing for the adoption of this form of contract by public bodies and others.

Generally, the Federation never hesitates to take up any question which appears, in the interests of its members, to demand attention. In particular, allusion may here be made to the recently-concluded agreement by which THE BUILDERS' JOURNAL has become the official journal of the Federation. In its pages matters of interest to the industry may be discussed and opinions tested, information disseminated, and facilities afforded for builders to bring before the architectural profession their qualifications for undertaking important work; also for producers of every kind of material required in building to advertise.

To illustrate the activities of the National Federation, the following summary of the more important work of the past eighteen months is given.

Summary of Work.

During 1908 the following subjects have required the attention of the Federation:

The Conciliation Boards have been active in dealing with the numerous demands for alterations in working rules, advances of wages or shortening of the hours of labour.

The Federation took active steps with reference to some objectionable clauses in the Government Bill affecting insurance under the Employers' Liability Act, and as a result secured an important amendment which met the objections.

Evidence was tendered by Federation representatives before the Departmental Committee of the Board of Trade on fair wages clauses in Government contracts.

Members of the Federation served on the Departmental Committee for Prevention of Accidents in the Building Trade. Careful consideration was given to the proposed regulations and representations made where judged necessary.

Negotiations were concluded by which THE BUILDERS' JOURNAL becomes the official journal of the Federation.

Assistance given in protesting against the Miners' Eight Hours Bill. Amendments suggested in regard to the Sweated Industries Bill.

Generally, each measure which was likely to affect the building trade has had consideration, and where necessary action has been taken.

Organised efforts to extend the Federation have continued in various parts, and conferences of secretaries were held for a similar object. Two general meetings of the Federation have been held; also numerous committee meetings.

Conclusion.

Finally, it should be said that the National Federation does not seek, and never has sought, to impose arbitrary conditions on either workmen, architects or clients; it exists simply to defend its members against attack, to elevate the status of the members of the building trade, and to enable the industry to be carried on efficiently for the public good.

As to future possibilities, these are obviously with the Federation. The continual increase of facilities for rapid intercourse in this country is making our island a very small place, so far as regards time and distance. This, in its turn, extends the area over which each local employer can, may, or must extend his operations, and the more he so extends, the less his own local Association is able to help him, and the more he has to look to the County or National Federation for any assistance he may need.

As regards legislation, too, the future is full of presage of Socialistic reforms, which are likely to bear hardly on industries of every kind and will demand the most unceasing vigilance if disaster is to be avoided. It is to the extent and strength of combination that employers will have to trust to defend the interests of this great industry, and in the Federation, with its democratic and representative constitution, and its power of expansion, will be found the best weapon.

REINFORCED CONCRETE WORK IN 1908.

During the past twelve months reinforced concrete as a system of construction for modern buildings may safely be said to have leapt into first favour. Architects and engineers have become generally convinced of the economy and the lasting quality, as also of the fire resistance of reinforced concrete construction, and seem to look to it before almost any other method where economy is a first consideration. The objections on æsthetic grounds that were raised against steel-frame construction seem to have been less vehement against reinforced concrete, and the R.I.B.A. and other professional societies have encouraged students to attempt to solve the problem of giving reinforced concrete a satisfactory æsthetic form. All the Government Departments, with the exception of the Local Govenment Board seem now convinced of its advantages, and the feature of the past pear has been its adoption for the large extension to the General Post Office and branch district post offices in London, all of which are complete reinforced concrete frame buildings.

An increasing number of buildings, as also of engineering structures in steel and concrete, have been undertaken, and this great alteration in building methods has made it incumbent upon the local authorities to make some provision in their by-laws for steel frame and reinforced concrete frame structures. The London County Council has, for instance, decided to seek powers from Parliament next session to get an alteration of the present Building Act so as to permit of the adoption of this most economical and lasting construction, while Liverpool has already obtained Parliamentary sanction to its new bye-laws for steel-frame and reinforced-con crete construction. Manchester and Sheffield also have Bills for the same purpose before Parliament. The fact that the by-laws of this country were framed years ago in such a manner as to prevent the adoption of improved methods which were bound to arise in course of time by the growth of scientific knowledge and the changing conditions, has not only been a great drag upon the progress of reinforced-concrete and steel-frame construction, but has shown the very great cost to which the community may be put by hard and fast regulations that admit of no loophole for amendment without seeking Parliamentary sanction. It is to be hoped that the experience thus obtained will induce the framers of subsequent building by-laws to obtain as wide powers as possible for subsequent amendment, and to frame and interpret their regulations in a liberal spirit, so as to foster rather than hinder the improvement in efficiency and economy in building operations.

Another outstanding feature of the past year has been the establishment of a new technical society to deal with the now vastly important subject of concrete plain and reinforced, namely the Concrete Institute. We include portraits of the chief officers of this Society, which has started under the most favourable auspices, having the Earl of Plymouth for President, and Sir Henry Tanner, Sir William Preece for Vice-Presidents, and an extremely strong Council of Architects, engineers, chemists, concrete specialists and others. The membership is already large for such an infant society. It is very surprising that such an institution was never projected before, for the cement industry has for many years been a great one, and has been growing rapidly. It looks as if the Concrete Institute will become one of the largest and most important of architectural and engineering societies. It has been called into being because older professional societies have proved themselves unable to appreciate the importance of the subject of concrete, or have not been able to devote sufficient time and attention to its consideration. Efforts in all directions seem to be becoming more and more specialized, and the subject of concrete is no exception. As it has been neglected for so long there is an immense amount of work to be done, and existing professional societies could not legitimately claim to be competent to deal with it. The Concrete Institute has a wide province quite distinct from any other society, and the specialist attention it will devote to the consideration of one of the most important branches of construction will be of the greatest service to the architectural and engineering professions. There have been many societies established in late years without sufficient reason, and no real necessity, merely duplicating the work of other older societies. This is to be much deplored. But the Concrete Institute does not belong to that category, and the fact is proved if in no other way by the large number of members of the Institution of Civil Engineers who have joined as members of the new Society. Architects are becoming enthusiastic in the use and appreciation of concrete in its many forms and are also coming to the support of the Concrete Institute, the labours of which will probably do more to bring the material into its due prominence than any other agency.

Commencing with a round table conference of some dozen professional men interested in the subject, at the instigation of Mr. Moritz Kahn, and further obtaining the co-operation of the leading members of the industries concerned, the pioneers of the movement started the Institute with one hundred founders and the body now counts a membership of three hundred and fifty at the close of the year.

The Institute has held its first two General Meetings, at which interesting papers were read and discussed. It has formed some of its more important Standing Committees and should be doing regular work in the new year.

An enormous amount of enquiry and research are required both in concrete and reinforced concrete, so that it has a wide field for its activities, and it is also to be hoped that the Concrete Institute will also undertake extensive research work in due course.

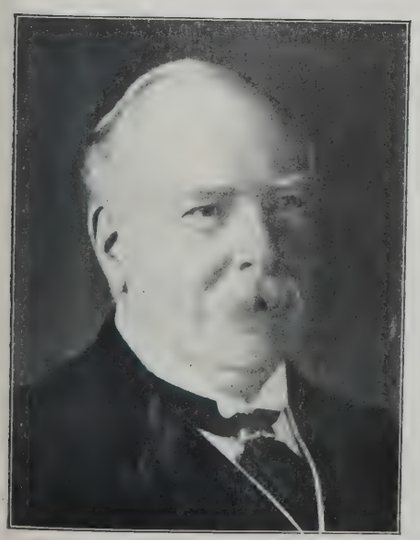
THE Concrete Institute, 1908.

PRINCIPAL OFFICERS.

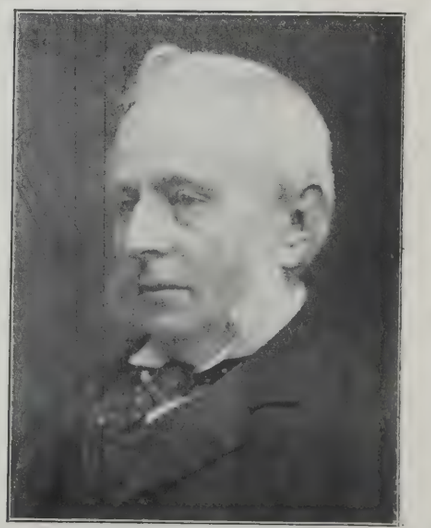
SIR WILLIAM H. PREECE, K.C.B. LL.D., R.S., J.P., Vice-President.

SIR HENRY TANNER, I.S.O., F.R.I.B.A., F.S.I. Vice-President.

THE EARL OF PLYMOUTH, C.B., President.



MR. E. P. WELLS, J.P. Hon. Treasurer.



MR. EDWIN O. SACHS, F.R.S. EDIN., A.Inst.M.E., Chairman of the Executive.

MR. A. E. COLLINS, M.Inst.C.E., Hon. Secretary.

SIR WILLIAM MATHER, LL.D., J.P., Vice-President.

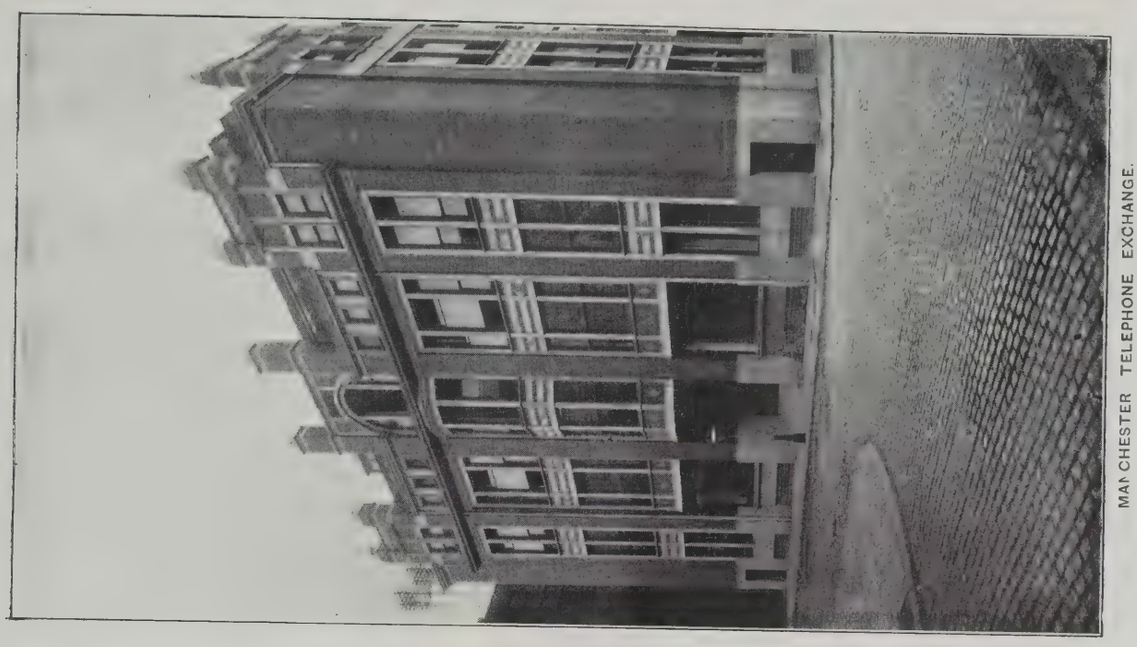
SIR DOUGLAS FOX, J.P., M.Inst.C.E. Vice-President.

Photographs: The Earl of Plymouth, Sir W. H. Preece, Sir William Mather, and Sir Douglas Fox, by Elliott and Fry, London. Sir Henry Tanner, by Lavender, Bromley. Mr. E. P. Wells, by A. Percival, London; and Mr. A. E. Collins, by A. E. Coe and Son, Norwich.

With the professional public it will no doubt help to popularize new methods of building, especially of reinforced concrete.

The past year has been noteworthy for the large and important buildings in which reinforced concrete has been made a distinguishing feature of the construction. For instance, in addition to the General Post Office Extension (of which Sir Henry Tanner, I.S.O., F.R.I.B.A., is the architect), and the Western District Post Office, the following may be singled out as buildings in the first rank: Wesleyan Memorial Hall, Westminster, New Record Office for the Bank of England (A. C. Blomfield, architect), New Telegraph Stores, Birmingham for H.M. Office of Works; Borough Polytechnic Institute; St. Charles Chapel, Notting Hill, London; Selfridge Stores, London (the most complete and up-to-date frame building in England); Extension of Caxton House, Westminster; Union of London and Smith's Bank, Hull; Bournemouth Gas Works, Poole; Dundee Generating Station; New Works for the British Aluminium Co., Ltd.; Second Tobacco Warehouse for Bristol Corporation; Rhyl Pavilion; Norwich Union Building, Piccadilly; The Royal Liver Building, Liverpool. Expanded metal figures in a number of important buildings.

The Wesleyan Memorial Hall—a monumental building—is being built very largely of reinforced concrete, including a large dome. We may also mention that the floors of the new extension to the British Museum will be constructed of reinforced concrete. The permanence and the fire-resisting character of such construction fits in especially for the construction of such buildings. It provides the best construction for such purposes at a cost that is less than other rival forms of construction, and even below that of ordinary methods that are not so efficient. Small wonder is it then that the application of reinforced concrete is advancing by leaps and bounds. We illustrate in this annual review a few of the more important buildings in which reinforced concrete has been largely used. There are a multitude of smaller works that we have no space to deal with. The variety and importance of the system of construction becomes manifest from a casual inspection of such a collection, even if we omit to recall the fact that the building trade has been very slack during the past year.



N.B.—We are asked to draw attention to the announcement of the Patent Indented Steel Bar Co., Ltd., on page lvii. Owing to an oversight in drawing up the particulars, the firm's address—Queen Anne's Chambers, Westminster, S.W., has been omitted from the page.

THE CHOIR, DOWNSIDE ABBEY, Near BATH.

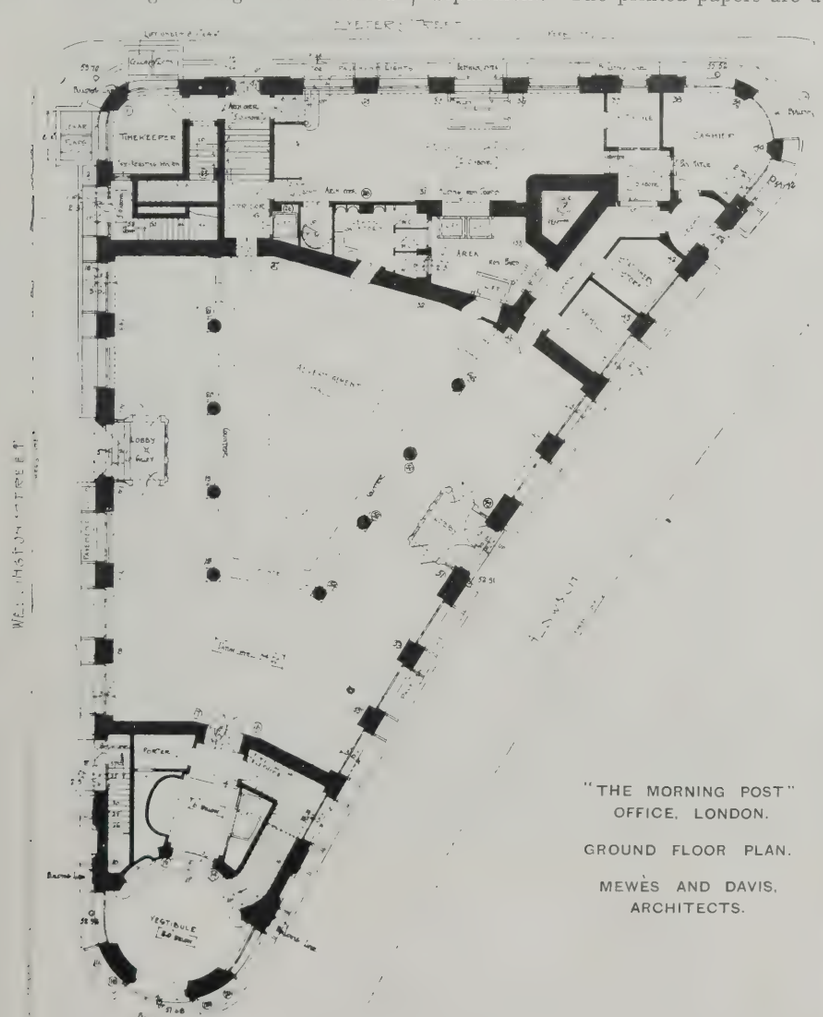
The history of the community of St. Gregory's at Downside in Somersetshire dates from the year 1814, when the monks acquired the estate of Mount Pleasant, Downside, with some 66 acres of land. To the existing house was added, in 1823, a Gothic block of classrooms and cells from the designs of the late Mr. H. E. Goodrich of Bath. In 1853 Mr. Charles Hansom designed a large school block which was added; but it became necessary in 1870 to consider new plans for a monastery with a church on a fitting scale; a block to comprise new kitchens, a new refectory, and new dormitory for the school. These additions were embodied in a plan prepared by Messrs. Dunn and Hansom, and the work was forthwith put in hand. The transepts of the new church were opened in July, 1881, and in 1888, the Lady Chapel was finished, to be succeeded by the rapid completion of the Chapels.

The addition of a choir and presbytery to the abbey was commenced in July, 1902, the design being that of the late Mr. Thomas Garner, who, in 1900, succeeded the late Mr. Edward Hansom as architect to the community. Messrs. Dunn and Hansom's work embraces the existing transepts, the tower, and the eastern chevet of chapels. Many modifications of detail were made in the course of construction, all tending to make the building more ornate or decorated in style, instead of the sterner Early English originally contemplated. Mr. Garner altered the plan of the choir prepared by the late Mr. Edward Hansom, providing a bold square end in place of the apse, and as the foundations of the apse were actually completed he used them to support the columns of the feretory, thus partly preserving the former scheme, and joining his square-ended choir to the curved line of chapels already built, so that no change of plan can be perceived. The style of the new choir is typical of the transition from Decorated to Perpendicular. Mr. Garner's design increased the thickness of the walls, lengthened the clerestory windows, and simplified the vaulting. Basing his treatment on a precedent at St. Albans Abbey he introduced a single light at either side of the central east window, thus enhancing the effect of space and loftiness.

The portion of the church thus gradually completed from the eastern bay of the nave to the end of the Lady Chapel measures externally 230ft.; the breadth across the transepts and tower is 125ft. In the interior the transepts are 83ft. long, 68ft. high, and 25ft. wide; the choir from the chancel arch to the columns behind the altar measures 95ft. long and 28ft. wide, and rises from 68ft. to 70ft. by the middle of the third bay. The building is constructed of Bath stone (supplied by the Bath Stone Firms, Ltd.) both internally and externally.

The Rev. Dom. F. P. Whiteside, Bursar at the college, was the builder. The tiles were supplied by Craven Dunnill and Co., Ltd., and J. Crispin and Sons, Ltd., carried out the heating. W. Bainbridge Reynolds fitted the door furniture, hinges, and latches, also large hinges to the screens.

DOWNSIDE ABBEY: FROM THE SOUTH-EAST, SHOWING THE NEW CHOIR. THE LATE THOMAS GARNER, ARCHITECT.



GENERAL VIEW OF THE CHOIR, DOWNSIDE ABBEY, LOOKING EAST. THE LATE THOMAS GARNER, ARCHITECT.

"THE MORNING POST" OFFICE, LONDON.

The problem in planning this building was a difficult one, the site being triangular, which allowed lighting from three streets, but necessitated having a central lighting well within the building, the only other light and ventilation being obtained from an enclosed area, around which on the various floors the lavatories are grouped, thereby keeping the whole of the plumbing work out of sight. Other difficulties were many, as the building, being of the "warehouse class," and coming under the Factory and Workshops Act, the basement had to be isolated from the other portion of the building, having its own entrance and escape exit from and to Wellington Street, internal communications from all floors, however, being allowed by an unenclosed lift in the enclosed area. The basement is used for printing and paper storage, and the sub-basement, about thirty feet below the pavement level, for the foundation to the printing machines, and the boiler-house, etc. A large lift recessed within the building in Exeter Street communicates with the paper stores.

The building being steel-framed throughout, it was thought desirable to form special grillages to carry the walls supporting the printing machines, and to so cantilever the same that no vibration can be transmitted to the steel columns which carry the building. The basement walls, which were formed in concrete, vary from eight feet to twelve feet in thickness according to their height; the backs of the walls are covered with asphalt, which is carried under all the floors and grillages and over the vaults, thereby making the basement impervious to damp, and a sump, connected to the drainage system, was made to relieve the horizontal asphalt from any water pressure.

The main entrance to the offices was desired from the Strand, and this corner of the site, being a rounded angle, a circular vestibule was formed there, giving easy access to the advertisement hall, which chiefly occupies the ground floor, and to the main staircase and the office lift. The portion of the ground floor facing Exeter Street is used by the cashier and the publishing department. The printed papers are delivered to this floor from the printing-room in the basement by two unenclosed lifts in the enclosed area. The advertisement hall, which has an entrance both from Aldwych and Wellington Street, as well as from the Strand, has been simply treated in Austrian oak panelling, slightly waxed polished. The columns are in "stuc plaster" imitating marble; inside them are steel stanchions encased with concrete. The pedestals are marble, as also the floor.

"THE MORNING POST" OFFICE, LONDON.

GROUND FLOOR PLAN.

MEWES AND DAVIS, ARCHITECTS.

The main staircase on the right of the vestibule, leading to the letting offices, bridges over the principal entrance corridor to the advertisement hall, which has other public entrances, as mentioned later on. From the bridge, at the second landing level, there is a fine vista into the circular vestibule.

The first floor, used by the editorial staff, is arranged around an open central well over the space occupied by the clerks in the advertisement hall, which gives an imposing effect to this floor. The second and third floors have been planned as offices to be let to the public, and are separated from the other parts of the building by fire-resisting materials. The fourth and fifth floors consist of the composing and readers' rooms, and the foundry, where the plates are cast, and when ready for the printer they are sent down two unenclosed lifts in the enclosed area to the "bruising room" adjoining the printing-room, where they are accurately shaped, cooled in water, and sent to the machines.

The façades have been built in "Standard Grey" Norwegian granite. This was worked in Norway from drawings, the carving being done in Aberdeen. The design is a modern rendering of Louis Seize, and it has been the architects' aim to get a simple, dignified, and well-proportioned building. The dome is in copper, and the roofs are covered with green Westmorland slates. The whole of the large metal sashes are of special sections.

The whole of the electric light wiring was carried out on the steel conduit system with galvanised steel-drawn conduits. Patent flush switches have been used throughout, and a feature of the installation is the main switchboard, which controls the whole of the lighting and power circuits.

The general contractors were The Waring-White Building Company, Ltd., of 12a, Cockspur Street, S.W. The work was carried out expeditiously, and the contract figure was not exceeded.

The following are some of the sub-contractors:—

Lifts: Archibald Smith and Stevens, Ltd., London. *Granite*: A. and F. Manuelle, London. *Plastering*: H. Johnson and Sons, Liverpool. *Plumbing*: Mellowes and Co., London and Sheffield. *Wood panelling, carving, and fittings in large advertisement hall*: H. H. Martyn and Co., Ltd. *Fireproof floors, roof and dome*: Columbian Fireproofing Co., London. *Lighting, electric bells, gas supplies, fire alarms*: Strode and Co., London. *Casements and gates*: J. L. Howard and Co., London. *Balcony railings*: St. Pancras Ironwork Co., London. *Fire-resisting glazing*: British Luxfer Prism Syndicate, Ltd., London. *Steel casements*: James Gibbons, Wolverhampton. *Pavings and staircases*: Stuart's Granolithic Co., Ltd., London. *Electric light fittings*: Faraday & Sons, London. *Patent Hanging Tiles and Urinals*: Doulton and Co's Fireclay Co., Ltd. *Portland Cement*: (Hilton Anderson Brand), Associated Portland Cement Manufacturers, Ltd., London.

ST. MARY'S CHURCH, HIGHWEEK, DEVONSHIRE.

This new church, designed by Mr. Edmund Sedding, and dedicated to St. Mary the Virgin, has been erected on a new and open site about a mile from Newton Abbot station. Local limestone of a reddish tone was chosen for the general external walling, from quarries situated only a few miles away. The face of the stone has been left a natural surface, the stones being laid in level random courses. The windows are wrought out of Corsham stone, which has been used throughout for the wrought stonework of parapets, weatherings, and "flyers" of the buttresses.

It will be seen from the north-west view that only the "stumps" of the pinnacles have been built at present, the upper surfaces being temporarily protected with cement. The large west window is about twenty-five feet wide, with two large chamfered mullions, each 2ft. wide, dividing it into three compartments. All the windows are glazed with clear leaded glass, except the three east windows, which contain painted glass.

The foundations for the future tower have been laid at the south-west corner of the church.

It will be seen from the ground plan that the church is divided into a nave rather more than forty feet wide, with north and south aisles of six bays each, covered by lean-to roofs, the full width of nave and aisles being 60ft. The chamfered piers and arches are 2ft. 6ins thick, the clerestory walls above being 3ft. in thickness; the extra thickness of the walls is given to the inside in order to obviate the thrust of the barrel roof, and it is supported by a bold hollow moulding relieved by carved pateræ.

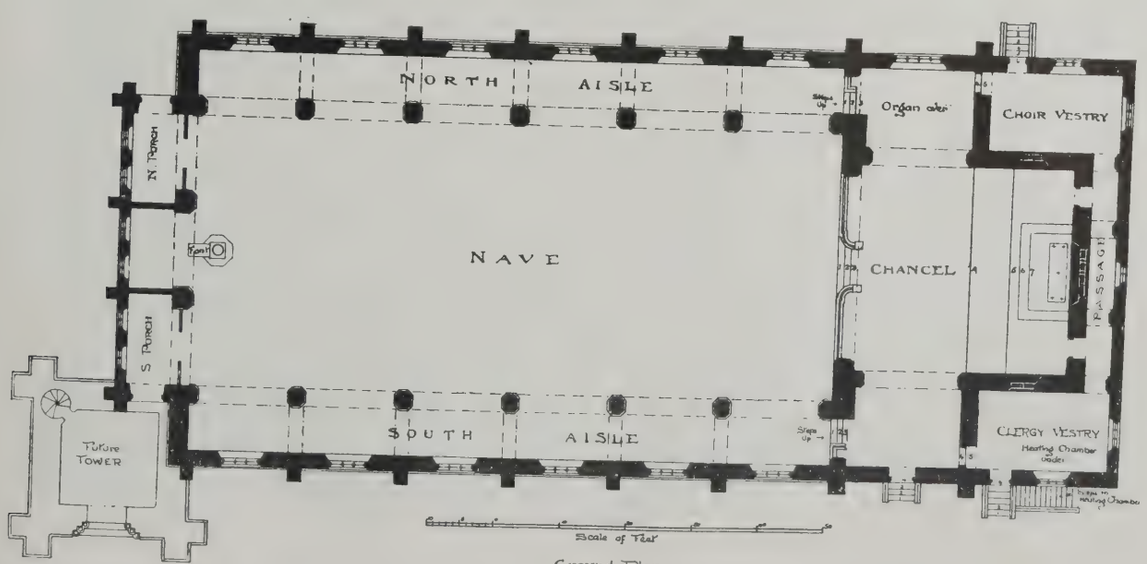
The principals, wrought out of Baltic pine, rest on cylindrical shafts, 7ins. in diameter, with carved capitals; the lower parts of the shafts are 6ins clear of the piers, owing to the additional thickness of the wall above.

The chancel is narrowed to 31ft. in width, and is separated from the nave by a low stone screen, above which is the chancel arch, a series of chamfers dying on to square responds. Space for the organ is provided on each side of the chancel behind the choir seats in the form of shallow transepts, the north and south arches being carried up as high as possible for acoustic reasons. The vestries are placed at the north-east and south-east corners of the building, and communicate with each other by an ambulatory, from which north and south doors open into the sanctuary.

The whole of the interior wall surface is lined with Bath and Bere stone, the two varieties being used to avoid monotony.

The main west wall is carried on three chamfered arches opening into a central baptistery, and north-west and south-west porches, all of which are covered by a continuous lean-to roof.

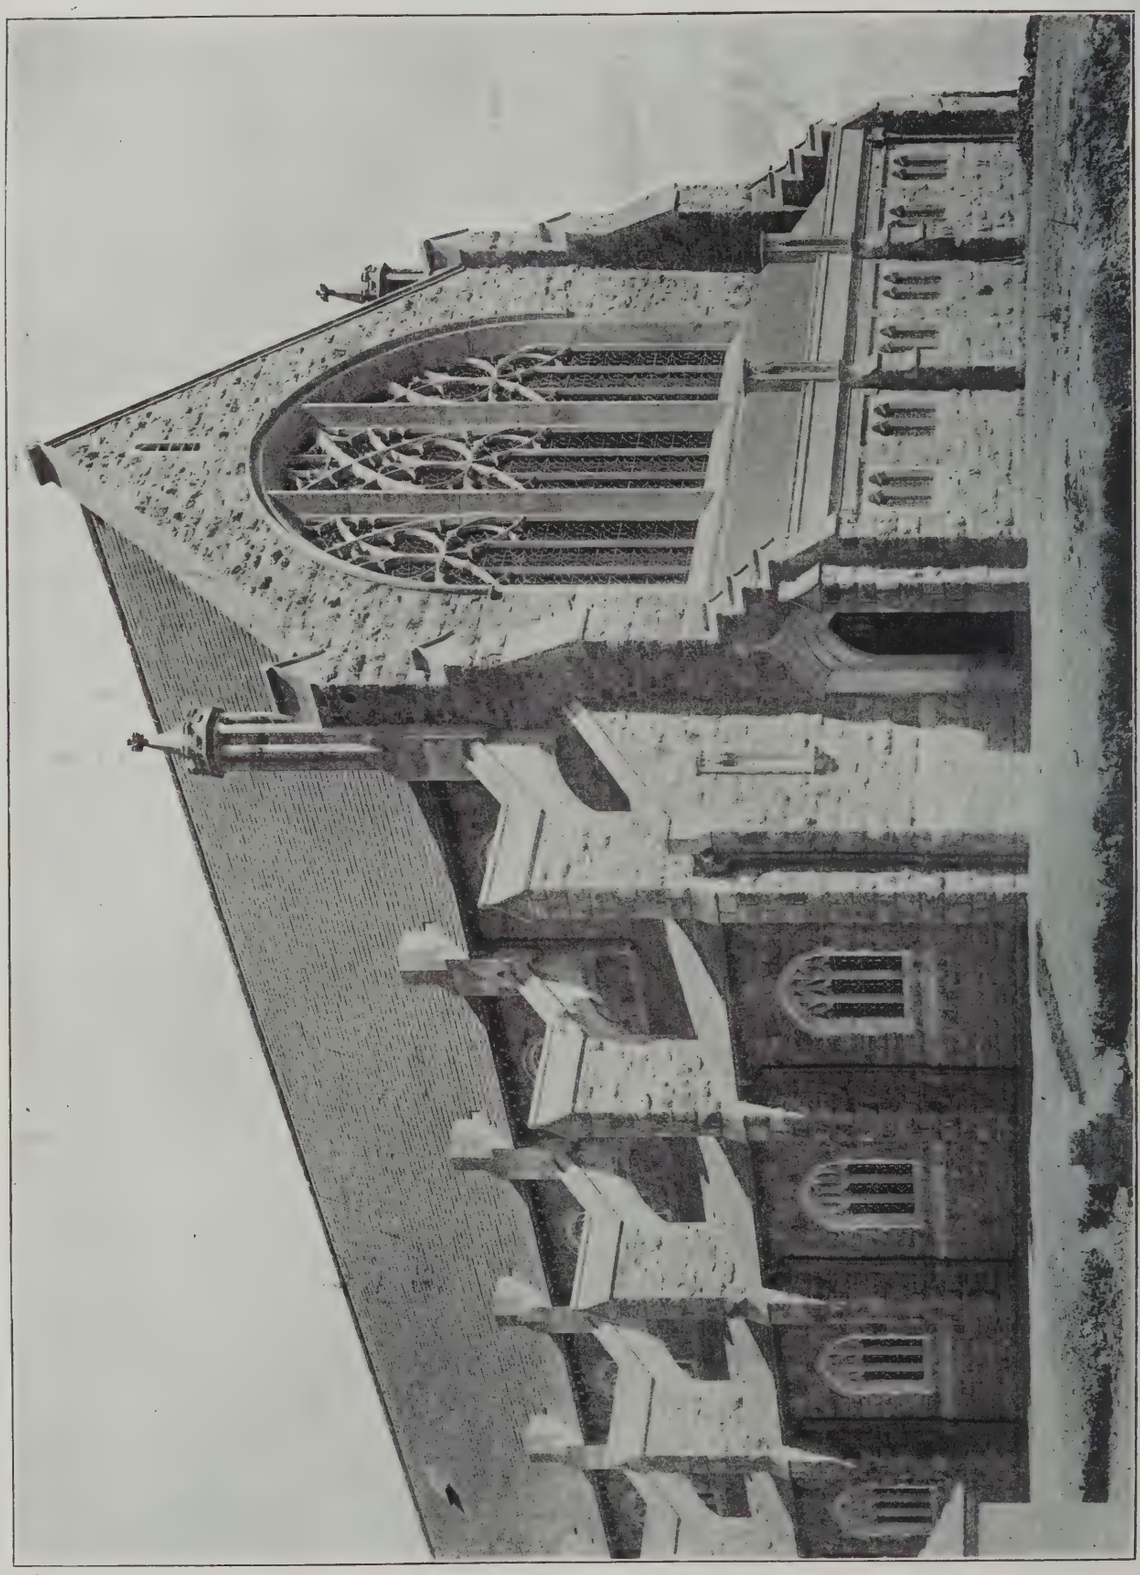
The roofs of nave and chancel are of barrel form, with arched ribs connected by purlins forming panels, which are boarded and painted white. All the structural timbers are of pine; the apex of the barrel roof is 45ft. from the floor.



The chancel is paved with large slabs of Sicilian, Irish, and Devonshire marbles, while the whole area of nave and aisles is paved with Oregon blocks, laid on concrete.

The roofs are covered with best Cornish slates secured by copper nails. It may be interesting to note that it was found by experiment that the common ribs—which are 5 in. by 4in., 13in. apart, with 5in. by 4in. rafters connected by 7in. by 4in. collars—were capable of sustaining the weight of the roof without the addition of the main ribs and purlins which are placed under them for additional strength and effect inside the church.

The length of the chancel is 35ft., the nave being 97ft. long, while the full internal length of the church is 145ft.



The heating is by low-pressure with floor-level and overhead pipes, the latter arranged at the apex of aisle roofs, the through openings in the arcade walls, masked with open tracery panels. The heat being conducted into the nave through openings in the arcade walls, masked with open tracery panels. The lighting is by incandescent gas.

The seats in the nave are low-backed pews, extending from the centre passage to the inner side of the bays; chairs are placed under the bay arches, and in the narrow aisles. The latter are so arranged that they can be used for processional purposes, the vestries having doors communicating with the choir transepts at the ends of the aisles. The choir vestry on the north side, and the clergy choir on the south side have separate entrances from the exterior, and an extra or emergency door is provided in the south transept. The chancel is raised three steps above the floor of the nave, and there are four more steps up to the altar level. The altar table has at present a simple backing of curtains, though there is ample height below the east window for a reredos of an elaborate character in the future.

THE LONDON, EDINBURGH, AND GLASGOW ASSURANCE BUILDING, LONDON.

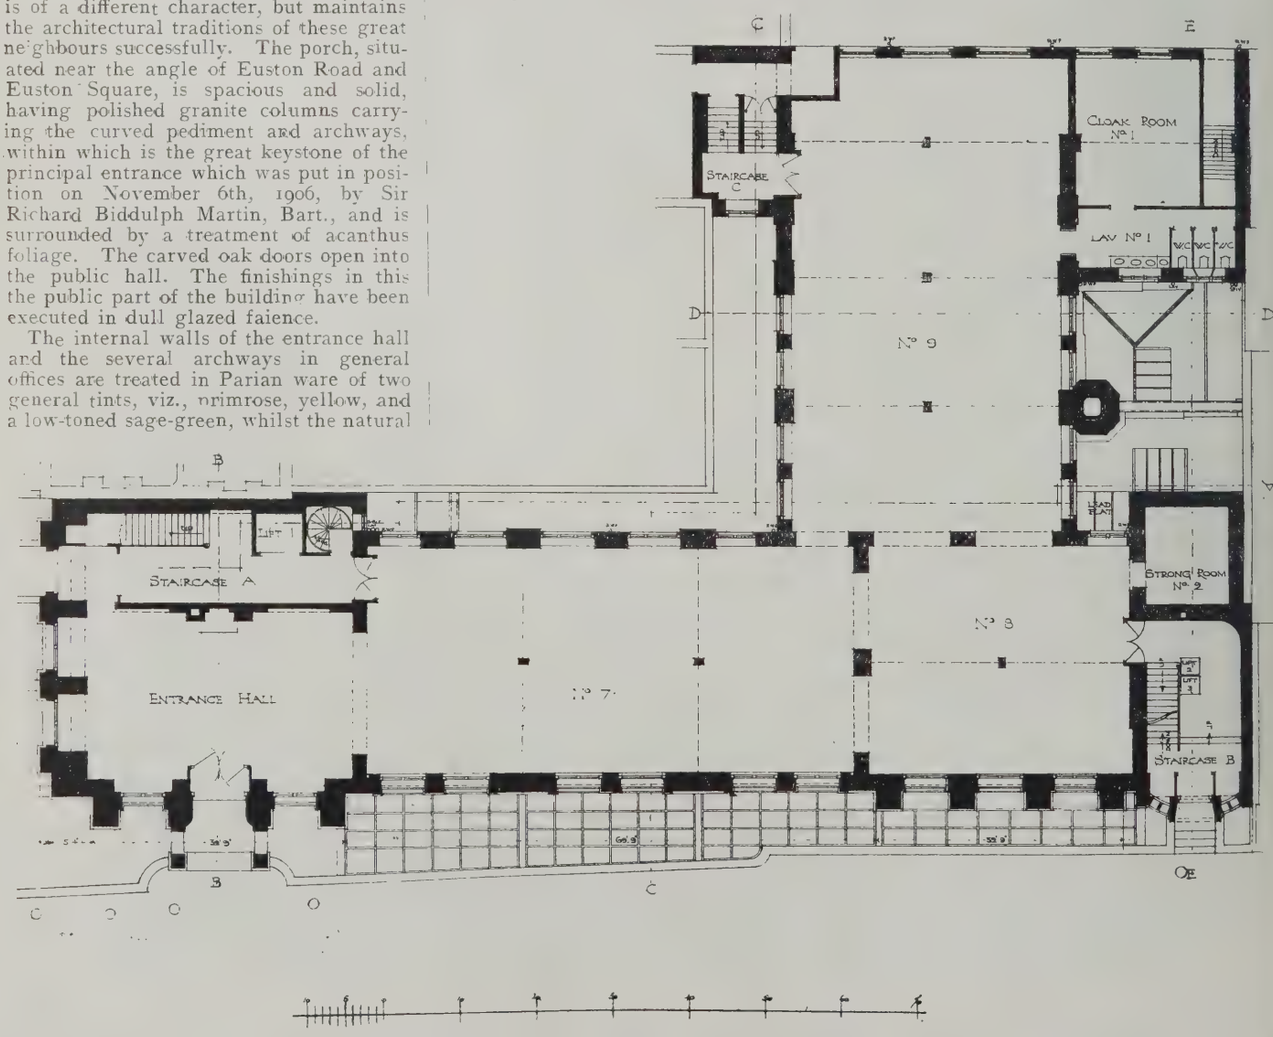
The new office of the London, Edinburgh, and Glasgow Assurance Co., Ltd., is close to all the railway termini which abut on Euston Road, and it has for near neighbours Euston, St. Pancras, and King's Cross Stations, of the London and North Western, the Midland, and Great Northern Railways respectively; also stations of the Metropolitan, City and South London, and Charing Cross and Hampstead Railways.

The elevations are of Portland stone in a monumental style of classic architecture particularly suitable for the offices of a great corporation. The great size of the internal apartments has enabled the front to be laid out with a sense of scale that is not usually obtainable in buildings in narrow city streets; ample light and dignified proportion, with architectural restraint, are the keynotes of the design.

The building, though in the neighbourhood of similar architectural monuments of great interest, such as University College, the entrance to Euston Station, and St. Pancras Church, being a public office is of a different character, but maintains the architectural traditions of these great neighbours successfully. The porch, situated near the angle of Euston Road and Euston Square, is spacious and solid, having polished granite columns carrying the curved pediment and archways, within which is the great keystone of the principal entrance which was put in position on November 6th, 1906, by Sir Richard Biddulph Martin, Bart., and is surrounded by a treatment of acanthus foliage. The carved oak doors open into the public hall. The finishings in this the public part of the building have been executed in dull glazed faience.

The internal walls of the entrance hall and the several archways in general offices are treated in Parian ware of two general tints, viz., primrose, yellow, and a low-toned sage-green, whilst the natural variations of each of these produced by the firing have been welcomed by Professor Pete, thus adding much to the richness and artistic character of the general effect.

Special mention must be made of the grand chimney-piece in the entrance hall, with its severe lines and the heraldic devices of the cities on the three slightly curved disks, the pattern work being boldly painted on the surfaces, and the colours, of course, fired on to the Parian ware.



The door from the entrance hall leads to the directors' staircase, by which we ascend to the board room, which is over the entrance hall. The room is severely treated with large plain oak panels, with windows looking upon the Square, the one point of colour being the handsome marble chimney-piece.

The lot of the clerk will be a very different one from that of the ordinary City clerk. He is here in a light and airy building surrounded with the necessaries for his daily work, with comfortable cloak-rooms close at hand, with safety fire staircases and access, to say nothing of telephones and electric light, and the special heating appliances which are provided for the staff of the company. Further, provision has been made in an economical part of the building—that is, on the top floor—for staff dining-rooms in connection with the caretaker's establishment.

Professor Beresford Pite was the architect. The general contractors were Foster and Dicksee.

The following are some of the sub-contractors:—

Tiling and faience: Doulton and Co., Ltd. *Steelwork*: A. D. Dawnay and Sons, Ltd. *Heating*: G. N. Haden and Sons. *Railings, etc.*: Thos. Crawn and Co. *Marblework and carving*: Farmer and Brindley. *Lift*: R. Waygood and Co., Lt. *Kitchen fittings*: Benham and Sons, Ltd. *Mosiac floor*: Rusts Vitreous Mosaic Co. *Ironmongery casement fittings etc.*: Robert Adams, James Gibbons. *Stallboard lights and Fire-resisting glazing*: British Luxfer Prism Syndicate, Ltd., London. *Electric light fittings*: Faraday and Sons, London.

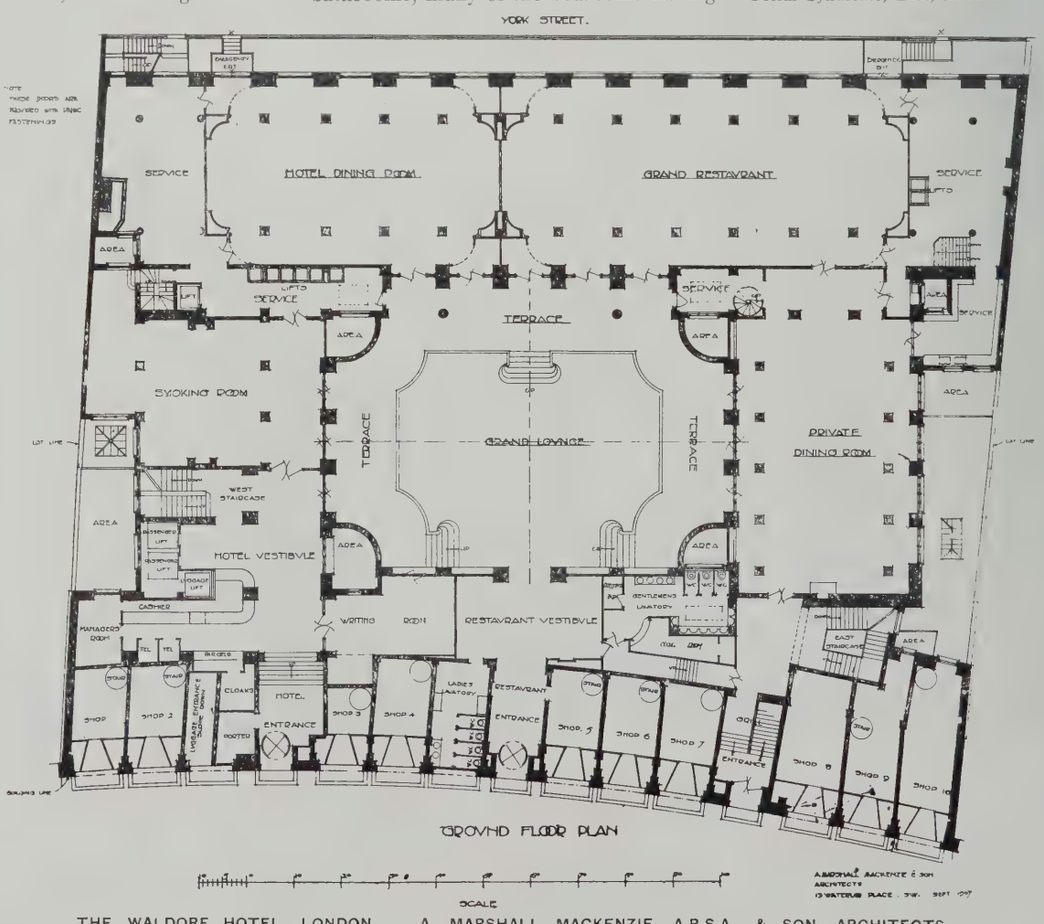
THE LONDON, EDINBURGH AND GLASGOW ASSURANCE BUILDING, LONDON. THE BOARD-ROOM.
PROFESSOR BERESFORD PITE, ARCHITECT.

THE WALDORF HOTEL, LONDON.

Occuping a conspicuous site in the broad new crescent connecting the Strand with Kingsway, the new Waldorf Hotel strikes a dignified architectural note in this improved heart of London. The facade to Aldwych is of Portland stone upon a basement of Aberdeenshire granite, and like the rest of the building inside as well as outside is designed in the restrained style of Louis XVI. The architectural basis is one of scale and quality. The parts are large and the outlines are bold and simple—an effect of magnificence being attempted without the aid of ornament. It may be said that the only ornament is the sculptured frieze capitals and vases. In the centre of the front there is an architectural screen of the Ionic order which gives interest and variety, and corrects what would otherwise be a monotonous array of numerous and regularly placed windows, which are of course necessary for the purposes of an hotel. In the matter of planning the architects are said to have visited America and made a study of American requirements as well as English.

The excavation and foundations were done three years ago, but the contract for the building proper dates only from September, 1906. In the remarkably short time of eighteen months the contractors, the Waring-White Building Company, Ltd., 1, Cockspur Street, have completely finished, and Waring and Gillow have furnished and equipped the building to which visitors to London are now flocking. This achievement has been possible by the method of construction adopted—viz., a skeleton of steel standards and girders supporting the floors and roofs, with an outer shell of stone and brick walls and slated roof. The floors as well as the roofs are constructed of fireproof materials—steel and concrete, the floors having an upper covering of hard wood boards, and the roofs an outer covering of lead and slates.



The partitions between the rooms are of Mack slabs, the use of which made for time-saving in the erection of the building. It may be noted that the partitions between rooms are of double construction for "deafening" purposes. The floors of the bathrooms are of "Doloment," said to be warmer than marble or tiles, and better as a non-transmitter of sound. The decorations and furnishing of the interior is, like the rest of the building, in the style of Louis XVI. The grand lounge in the centre measures 80ft. by 60ft., and is surrounded by the public rooms of the hotel and restaurant, as will be seen by the accompanying plans. The grill-room and grill-lounge and masonic temple rooms are in the basement, and the drawing-room, the billiard-room, and private dining-rooms are on the entrance floor. There are 400 bedrooms and 176 bathrooms, many of the bedrooms having bathrooms attached, while several of the rooms are arranged in small flats with sitting-room, bedrooms, and bathroom.

In the ventilating system fresh air is driven into the grill-room and grand lounge by means of two 15in. double-inlet cased fans, each direct-coupled to a 1¼-b.h.p. electric motor, and before being distributed to the various rooms is thoroughly washed and filtered, thus being made perfectly free from all extraneous matter. In cold weather the air is warmed by being driven over hot batteries.

The vitiated air from the grill-room, lounge, restaurant, ballroom, smoke-room, and masonic hall is carried up a vertical shaft to roof, and extracted by means of a 40-in fan.

The following are some of the sub-contractors:—

"Mack" fireproof partitions: J. A. King and Co. *Asphalt*: Thomas Faldo and Co., Ltd. *Cement*: Associated Portland Cement Co., Ltd. *Granolithic stairs and paving*: Stuart's Granolithic Stone Co. *Heating, ventilating, hot and cold water services, and fire hydrants*: R. Crittall and Co. *Passenger lifts*: The Otis Elevator Co. *Service lifts*: R. Waygood and Co., Ltd. *Plumbing and sanitary fittings*: Shanks and Co. *Joinery*: S. Elliott and Sons, Reading. *Plastering*: H. Johnson and Sons, Liverpool. *Fire escape staircases*: St. Pancras Ironwork Co. *Reinforcing bars*: Patent Indented Steel Bar Co. *Joinery, decoration, and furnishing*: Waring and Gillow. *Kitchen fittings*: Benham and Sons. *Expanded metal reinforcements*: Expanded Metal Co., Ltd. *Fire-resisting glazing*: British Luxfer Prism Syndicate, Ltd., London.

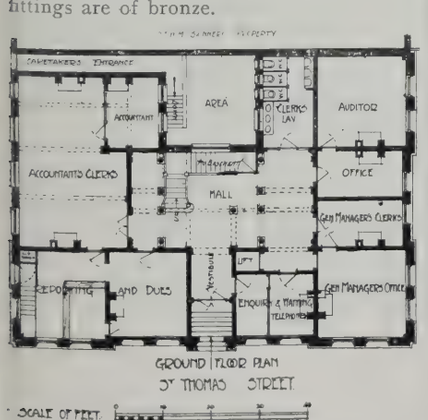
OFFICES FOR THE RIVER WEAR COMMISSIONERS, SUNDERLAND.

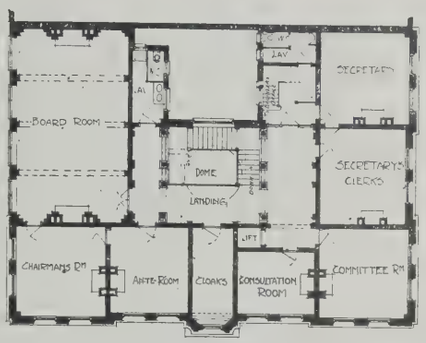
These premises have been erected upon the site of the old Post Office, situated at the corner of St. Thomas and John Streets, Sunderland, with aspects north and west respectively. The exterior of the building is faced with blue Heworth Burn stone, with rock-faced Corrennie red granite base, and the doorway is of polished granite from the same quarry, while the roof is covered with Tilberthwaite green slates.



In St. Thomas Street is placed the principal entrance, giving access to the central hall through a vestibule, the walls of which are lined with Skyros marble panels, surrounded by bands of verde antico, with base of Bleu Belge marbles, and the moulded capping, architrave, and soffits of arches are of selected alabaster; above is a barrelled and coffered fibrous plaster ceiling.

The central hall and landings give easy access to all parts of the building. The floors are fireproof and laid with marble tiles formed in black and white squares, and the wall panelling, staircase, and columns are executed in Austrian oak fumed and dull polished.

A coffered fibrous plaster dome rises from the ceiling; the latter, enriched and coved, springs from an arcade of fluted ionic columns upon pedestals, with a balustrade between, which forms a handrail to the first floor landing. Lighting to the staircase is obtained by means of a large window, also from the glazed eye of the dome.



The board-room is upon the first floor, and the walls are panelled to a height of 15ft. with Cuban mahogany; festoons of carved fruit and flowers of the same wood decorate the pilasters, and the carving over the chimneypiece at each end of the room is in lime-tree. An enriched barrelled and panelled ceiling surmounts a coved and carved cornice.

All departments have open fires, and the entrances, landings, and lavatories are heated by radiators on the low-pressure system. Teak is used throughout for all external windows. A lift communicates with all floors. The principal electric fittings are of bronze.

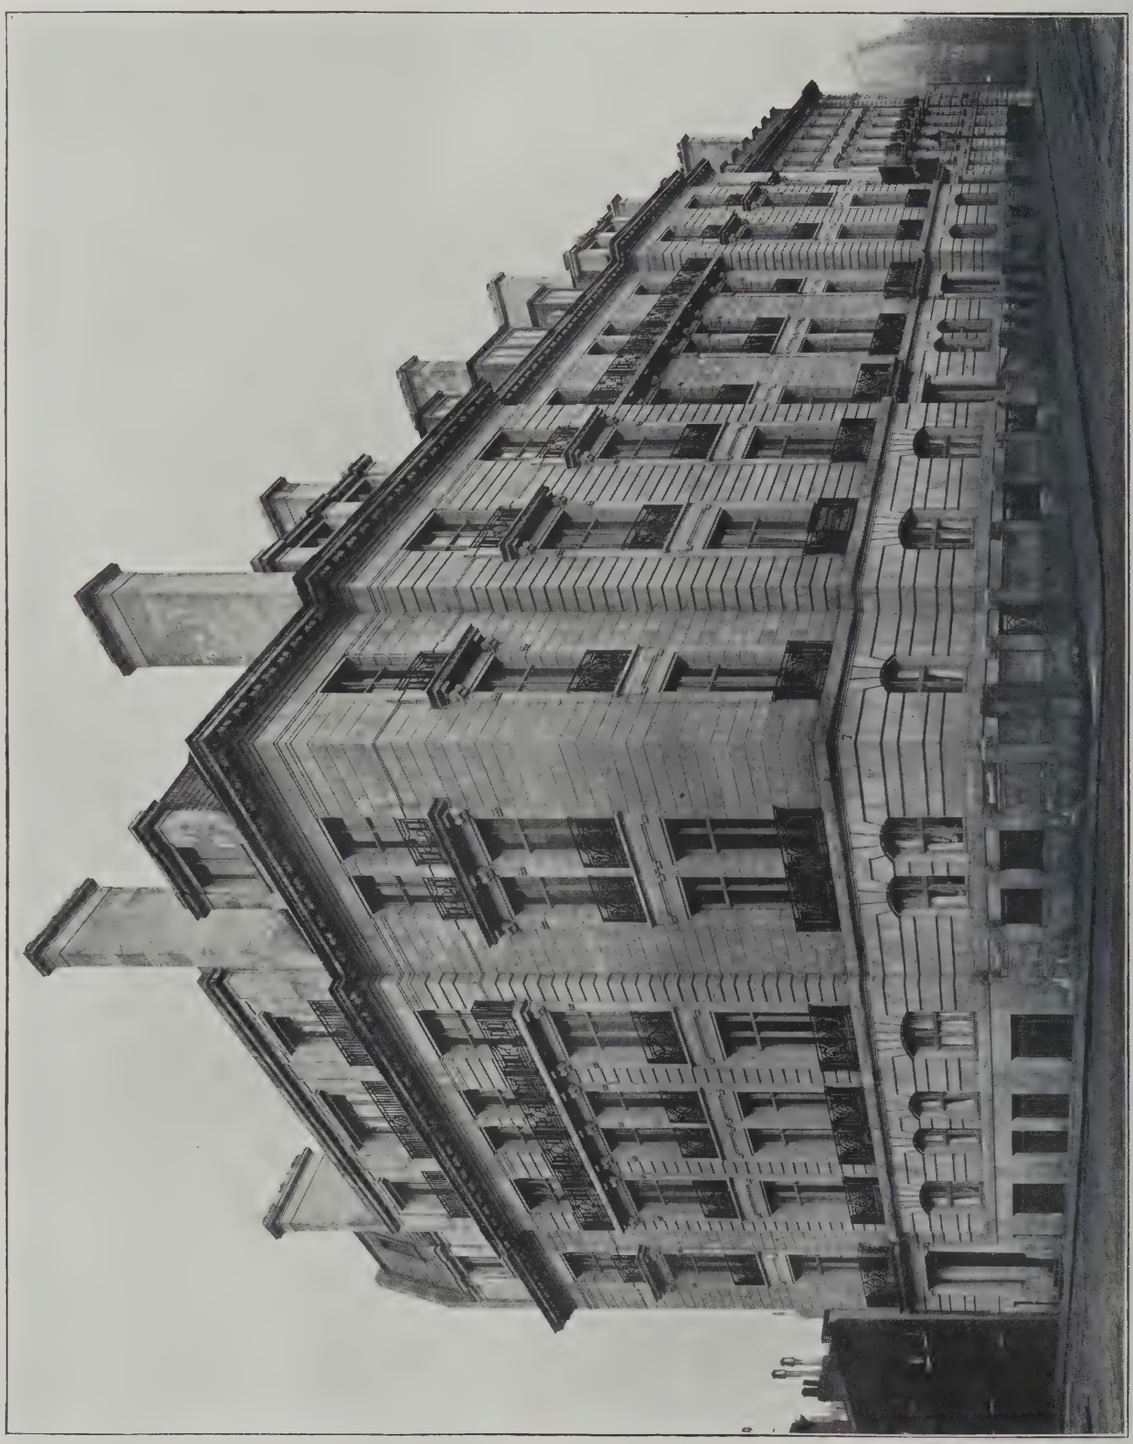
MANSION FLATS IN LONDON.

The monumental treatment of domestic buildings in London has hitherto been neglected, and but little appears to have been attempted towards its furtherance. Some large blocks of apartment houses designed in a manner essentially classical will not fail to evoke an interest therefore.

The layman and the architect both receive their impression of the merits or demerits of a building from its external appearance, and under these circumstances it is perhaps advisable first to elucidate the æsthetic principles that govern the design of these buildings before dealing with the strictly utilitarian problems of planning that shape themselves to the general scheme. The composition is of the most simple kind, as a reference to the illustrations of Berkeley Square and Cleveland Row, St. James's, will show. There is no striving after an unattainable originality, but a broad, dignified treatment of mass that relies on its scale for effect; no pedantic rendering of obsolete schools, or a version of modern French Renaissance (so much in favour now); rather a treatment that draws on all classical sources for its being, and is, if a name must be given it, more Neo-Grec in character than anything else.

One of the aims has been to studiously avoid using the columns and entablatures of any of the five orders of architecture as the chief elements of design in the facades; the buildings are astylar, and in that respect very much resemble the breadth of elevation attained by the Florentine architects. Although the order is, as exemplified by the column, conspicuous by its absence, its proportions are retained, and the result is more convincing, direct, and truthful. If the Florentine Palace is suggested by the astylar treatment, the Venetian Palace might also be claimed to have served as a prototype for the projecting balconies; but this is not strictly so, as the architectural treatment of iron balcony railings employed in London by the architects of the Classical Revival has perhaps been the greatest source of inspiration for a feature of London street architecture that is sadly neglected in modern contemporary design. Not since the days of the Brothers Adam, Sir John Soane, Nash, or Decimus Burton (excepting the mediocre work in Belgravia) has an attempt been made in London to deal with the problem of combining several dwellings under one architectural scheme, in a manner suitable to the true architectonic character demanded by the dignity of a great city. The usual method of design is to impart wholesale into the fabric all the details and rusticities evolved by country conditions. The result cannot be satisfactory, and buildings erected in this manner look out of place; finally, blackened by the London soot, they frown on the passer-by as though looking for the cause of their misfortune.



As already pointed out, there is ample precedent in London for the classical treatment of Flats. The original design for the old Regent Street Blocks provided for suites of apartments over the shops. The design for a West End address for the many was evident nearly a hundred years ago, and the demand was then met in an architectural spirit.

The requirements of the London Building Act allow full advantage to be taken of the 80ft. height line, and in two of these blocks, *i.e.*, Berkeley Square and Portland Place, six storeys are combined under the main cornice, including the ground floor. The advantages of a classical treatment for the façades is apparent, and if reference is again made to the illustrations it will be seen that no one floor is given prominence over another, and this trait is caried right through the work. The rents of each floor naturally vary slightly according to their height above the ground floor, but the result desired is that the tenants shall feel that the floor they occupy is of the same artistic importance to the appearance of the house as any other floor rented by their cotenants, irrespective of rental value. The window openings above the plat band in these three buildings are designed as simply as the main masses, heavily-moulded architraves are avoided, likewise meaningless keystones, absurd rustications, and all the paraphernalia of the man who does not think and reason out his details. If a columnar treatment is avoided, so also is the usual type of architrave to the windows, and so through all the details elimination of superfluities is continued. Another important feature aimed at is a cohesion between all the

FLATS, BERKELEY SQUARE, LONDON. FRANK T. VERITY, ARCHITECT.

window openings in a vertical direction. Horizontally, this is not a difficult matter, as the flow of line is easier to maintain; but vertically the prob'em is much more difficult, especially if the designer burns his boats behind him, and discards stock-in-trade elements.

Over and beyond the question of planning and accommodation, there is one of these blocks in which the problem was rather more difficult. The building referred to constitutes a block known as Nos. 3, 4, 5, and 7, Cleveland Row, on a site facing St. James's Palace, and carries on the architectural lines of the adjoining New Alliance building. The conditions of the scheme were laid down to comprise three town houses with a frontage to Cleveland Row and with garages to each in the rear, and a suite of flats to Cleveland Square with accommodation in the roof over these flats for the London Fencing Club.

The height of the various stringcourses and the main cornice were set by the Crown authorities, and the conditions also require a traditional roof being used above the main cornice contrary to the architect's usual manner. The scale of the whole block was given by the three houses in Cleveland Row, and, bearing in mind the limitation of height, the detail was kept consistently delicate and refined, as befitting its purpose.

If a building is to be considered monumental, apart from its design, it must be constructed of lasting material, and the designer of large buildings almost invariably chooses Portland stone, it being the most suitable material for the London atmosphere. With the exception of the mansions at Hyde Park Place (which are built of Ham Hill stone), all the buildings executed by Mr. Verity have been carried out in Portland stone.

FLATS IN BERKELEY SQUARE, LONDON: ENTRANCE VESTIBULE. FRANK T. VERITY, ARCHITECT.

As already mentioned, the cast-iron illings forming the balcony fronts to the ove buildings are influenced by the inciples of design that characterised the lcony fronts of the late eighteenth and rly nineteenth centuries. The ironwork designed with due respect to the various itures of the front it enriches, with a adual lessening from richness to a com-rative plainness according to height.

nternally, the entrance halls, vesti-les, and staircases are finished in uc," or "Stonite," French prepara-tions, the use of which enables the architect to give an excellent representation of a stone interior at very little expense.

The cost of the buildings has been as follows:—

Berkeley Square, £50,000; contractors, Mark Patrick and Son. Cleveland Row, £60,000; contractor, James Carmichael.

The following are some of the sub-contractors:—

Stone (generally): Ham Hill Stone Co. *Stone (carved work, chimneypieces), flooring (mosaic marble, stone)*: Farmer and Brindley. *Steel work*: Dennett and Ingle. *Tiles, mosaic decoration and marble work (not floors)*: Rusts' Vitreous Mosaic Co. *Asphalt Roofing*: Faldo Asphalte Co., Ltd. *Casements and casement fittings, stair treads*: St. Pancras Ironwork Co. *Patent glazing and fittings*: Heywood's Patent Glazing. *Stoves, grates, mantels*: Bratt, Colbran and Co., Longden and Co. *Plaster work*: George Jackson and Sons, Ltd., Battiscomb and Harris. *Art metal work, gates, railings, handrails, etc.*: Joseph Stone and Co. *Electric light fixtures, electric wiring, ventilating apparatus (alone), bells, electric and wire pull, etc., telephones*: Higgins and Griffiths. *Door furniture, locks, etc.*: Carter and Aynsley. *Folding gates, shutters, etc.*: Bostwick Gate Co. *Lifts*: Titan Lift Co., and R. Waygood and Co., Ltd. *Strongroom doors, safes, etc.*: Milner and Co. and St. Pancras Ironwork Co. *Cooking machinery*: Eagle Range Co. *Granolithic staircases*: Stuart's Granolithic Stone Co., Ltd.

NEW PREMISES FOR DEBENHAMS', LTD., LONDON.

The new buildings, of which a model was on view at the Franco-British Exhibition, were designed by and carried out under the superintendence of Mr. William Wallace and Mr. James S. Gibson, as joint architects.

The structure is of fireproof construction throughout, solid steel columns of small section and of great strength being used, and these were afterwards encased in marble.

The external elevations are entirely faced with Carrara Ware, as used at the Savoy Hotel and Gloucester House, which, by reason of its vitrified surface, is one of the few materials capable of withstanding the atmosphere of a large city, and of being restored to its original condition by periodical washing and cleaning.

The spacious entrance opens into a beautiful reception hall, lined with cool grey-green and white marbles. On either side are large rooms, and in front is the marble staircase leading to the departments above.

The decorative note is one of quiet harmony—the green marbles, dull bronze, touches of bright enamel, rich woodwork, delicately-modelled ceilings, and soft carpets in greens and greys, all serve to produce an unobtrusive but rich effect.

A feature of the building is its interior and exterior metal-work; the bronze and enamel columns and railings in the two main galleries, the bronze lamp-covers, electric fittings, bronze and cream-enamelled nameplates, and the bronze balustrading to the marble staircase and bronze caps and bases to the marble columns, internally and externally.

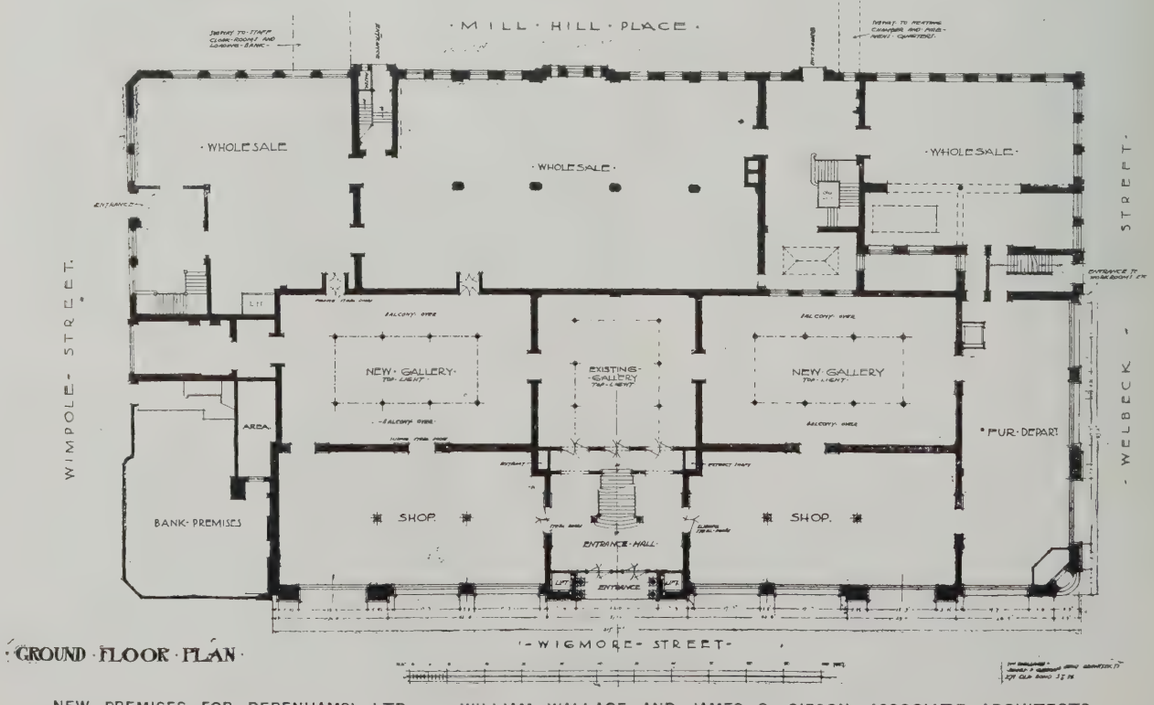
In rebuilding, the great problem was to minimise the disturbance of business, and to cause as little inconvenience as possible to the customers. It was finally decided that the most practical method was to rebuild in sections, each part to be finished before another was begun.

Great credit is due to the general contractors, Messrs Geo. Trollope and Sons, and Colls and Sons, Ltd., for the manner in which they worked out, in conjunction with the advisory staff, the general scheme for rebuilding.

The work was begun in February, 1906, and finished in September, 1907, and each section was not only completed within its scheduled time, but in many cases considerably earlier.

In order to do this, the work was carried on by two gangs of men working day and night under relief foremen. In most cases the lower floors were handed over, one by one, before the upper ones were completed or roofed in, temporary asphalt roofs being formed at different levels to enable the finishing of the floors below to be effected.

During all this time, however, business was conducted as usual, and, where necessary, communication between various departments was maintained by covered passages.



The heating is, in the main buildings, by steam on the atmospheric system, and the whole of the basement being ventilated on the plenum system, with very satisfactory results. The hot-water service throughout the building is provided from the boilers of the heating service during the winter, while change-over valves allow of this being heated by an ordinary low-pressure water boiler during the summer months. The apparatus, being maintained at a pressure lower than the atmosphere, gives a uniformly pleasant heat without any scorching effect upon the air, while the vacuum system obviates altogether the escape of foul air from the air valves.

The metal casements throughout the building have the best weather-tight sections, with simply designed gunmetal fittings.

A feature of the retail portion of the premises is the attention paid to the comfort of patrons, for whom lifts are provided to the upper floors. On the third floor a light and airy restaurant has been arranged with a smoking-room annexe, and on the opposite side of the landing is the club-room, with desks and stationery, easy chairs, and newspapers, for the use of patrons.

The following are some of the sub-contractors:—

Carrara ware: Doulton and Co., Ltd., Lambeth. *Constructional steelwork*: Homan and Rodgers, London. *Passenger and service lifts*: The Otis Elevator Co., Ltd., London. *Bronze caps and bases to columns, and balustrading to main staircase*: J. W. Singer and Sons, Ltd., Frome. *Marble work*: J. and H. Patteson, Manchester. *Decorative plastering to first and restaurant floors*: Ernest W. Gimson, Cirencester. *Decorative plastering to ground floor and galleries*: Gilbert Seale, London. *External and internal decorative work*: The Birmingham Guild of Handicraft, Birmingham. *Steam heating and metal casements*: Henry Hope and Sons, Ltd., Birmingham. *Pavement lights and electro-copper glazing*: The British Luxfer Prism Syndicate, Ltd., London. *Mosaics*: Rust's Vitreous Mosaic Co., London. *Steel doors*: The Crittall Manufacturing Co., Ltd., London. *Ventilating*: Jas. Keith and Blackman, Ltd., London. *Portland cement* (Hilton, Anderson brand): Associated Portland Cement Manufacturers, Ltd. *Exterior stone carving*: H. H. Martyn and Co., Cheltenham.

THE MERSEY DOCKS AND HARBOUR BOARD OFFICES, LIVERPOOL.

This building, designed by Briggs and Wolstenholme, F. B. Hobbs, and Arnold Thornely, has been erected by the Docks Board to accommodate the various departments which until recently were inconveniently scattered. The offices occupy a commanding position on the river frontage, the site being a portion of the old George's Dock, close to the Pier Head. The aspect is due west.

The structure was started about five years ago, the first nine months being occupied in putting in the foundations, which start from the solid rock from 30 ft. to 40 ft. below street level. About 5,000 tons of cement concrete were used for this portion of the work. Owing to the proximity of the River Mersey, and the fact that spring tides reach within 3 ft. of the level of the street, great care has been taken to ensure the basement being thoroughly dry. An inch of asphalt was accordingly laid over the whole of the site and carried up inside the balustrade wall to pavement level. The building is of fire-resisting construction throughout, steel columns, girders, etc., being incased in concrete. There are in all twenty-five strong-rooms, equipped with patent strong-room doors and ventilating gates, and there are, in addition, a large number of fire and thief-resisting safes.

The chief feature of the interior is the central octagonal hall, 72 ft. in diameter, and rising internally to a height of 120 ft., with a grand staircase and galleries at each floor level. Corridors radiating from these galleries provide access to all parts of the building. Seven electric passenger lifts have been installed.

The grand staircase is constructed of grey granite from the quarries belonging to the Dock Board at Creetown, Dumfriesshire, and the balustrade round the site is also built of the same material.

The halls and corridors on the ground floor are lined with white (Calacata) marble to a height of 8 ft. 6 in., the corridors on the upper floors having dadoes of white marble.

Danzig oak is used for the woodwork, except in the board-room, which is finished in Spanish mahogany. Bronze has been used throughout for all door furniture, all fittings being to special designs.

The lavatories are lined with glazed tiles up to ceiling level, and opaline divisions by Adamsez, Ltd., have been used between the w.c.'s. All woodwork here is of oiled teak.

A large number of the windows were manufactured to the architects' details. The sections employed were of special patterns with a high-class finish, which are generally used for buildings of this class. The windows are mahcine-made throughout, the joints being very exactly fitted through cutting with milling machines which scribe and tenon the ends to the exact shape required.

The designs throughout have been arranged with thought, imbued with the maritime nature of the business for which the building was erected—especially noticeable being the bronze terminals on the main entrance gates, representing a globe supported by dolphins, and the outside bronze electric light brackets, with the lamps in the hands of the broadly designed figure of Neptune.

The following are some of the sub-contractors :—

Best Whitbed stone: F. J. Barnes, Quarries, Isle of Portland. *Carved stonework*: Earp, Hobbs and Miller, Manchester; E. O. 'Griffiths, Liverpool. *Wall tiling*: C. W. Williams and Co., Manchester. *Opaline slabs to lavatories*: Adamsez, Ltd., Leeds. *Slating*: Waterhouse and Dondy, Liverpool. *Copper dome*: Ewart and Sons, London. *Asphalte flats*: The Seyssel and Metallic Lava Asphalte Co., London. *Casements and casement fittings*: Geo. Wragge, Ltd., Manchester; H. Hope and Sons, Birmingham; James Gibbons, Wolverhampton. *Patent glazing and fittings*: W. H. Heywood and Co., Huddersfield. *Grates and mantels*: Goodall, Lamb and Heighway, Ltd., Manchester. *Plumbing and sanitary fitting work*: Mellowes and Co., Sheffield. *W.C.'s*: Doulton and Co. *Urinals*: Twyford, Ltd., Hanley. *W.H basins*: Mellowes and Co. *Lead down pipes and R.W. heads (special make)*: Mellowes and Co. *Mosaic and marble flooring*: Diespeker, Ltd., London. *Electric wiring and bells*: The Alliance Electrical Co., Ltd., Birmingham. *Electrical fittings*: Veritys, Ltd., London. *Modelled plasterwork*: *special woodwork and carving*: Earp, Hobbs and Miller, Manchester. *Special doors*: Van Kannel Revolving Door Co., Ltd., London. *Stained glass*: G. NEW PUBLIC OFFICES, WESTMINSTER.

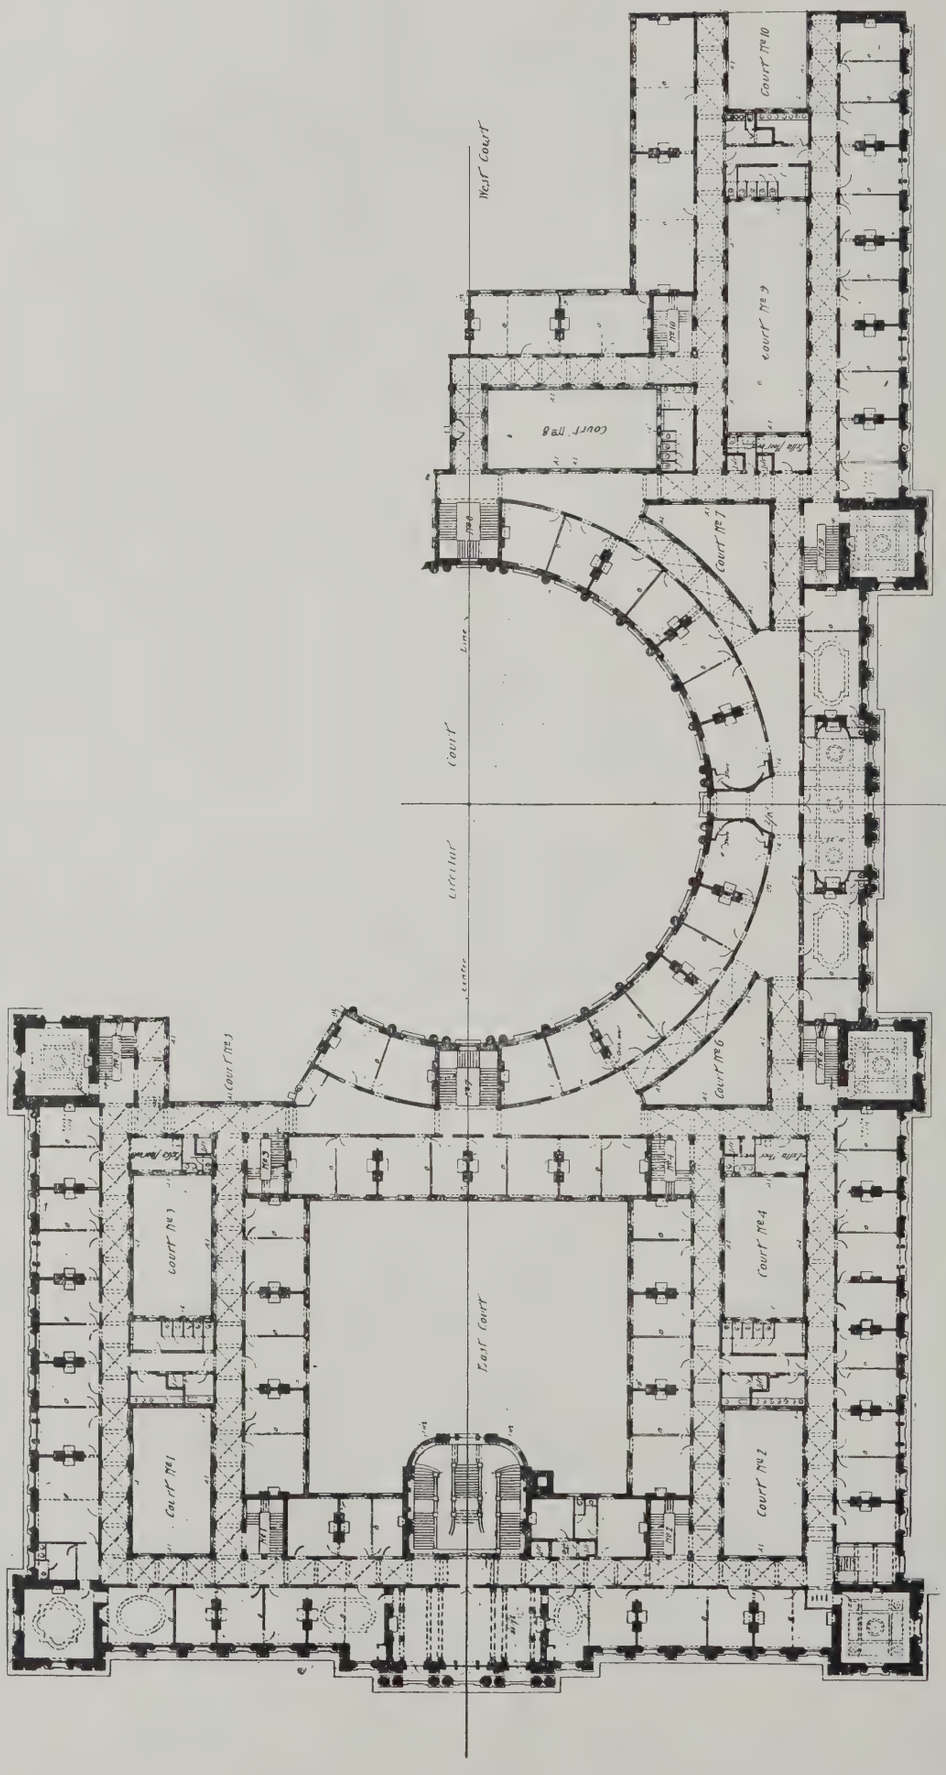
The site of the above building was acquired under the authority of several Acts of Parliament. It occupies an important position at the corner of Parliament Square and Parliament Street, and the area at present covered is about three acres. The buildings when eventually completed will extend the full length of Great George Street to St. James's Park, and will then occupy a further area of two acres. The new block is connected to the Home Office block by a stone bridge with three arches.,, The foundations were commenced in 1900, this part of the work being carried out by Mowlem and Co.; but before the superstructure was begun Mr. Brydon died, and its subsequent erection by Spencer, Santo and Co., Ltd., has been under the direction of Sir Henry Tanner, Principal Architect to the Commissioners of Works.

The style is English Renaissance, an important feature being the circular court, 160ft. in diameter, approached through archways from Charles Street, and to be later approached in a similar way from Great George Street. The latter part of the court is at present incomplete, pending the acquisition and demolition of the Institution of Civil Engineers and other buildings existent on the Great George Street frontage. The exterior is faced with Portland stone, and worked by the general contractors. The sculpture in the pediment is the work of Bertram Mackennal, and is designed to represent in some manner the use to which the building is assigned.

The principal entrance is on the Parliament Street front, and the sculpture here and all round the lower part of the building is by Mr. W. S. Frith. Mr. Frith is also responsible for the sculpture of the spandrels to the arches of the bridge connecting the new block of buildings with the Home Office block. The top sculpture on the bridge, from the chisel of Paul R. Montford, is made up of two projecting groups and a centre panel.

The entrance archways in Charles Street are closed by three massive wrought-iron gates, with decorative coats of arms in bronze.



The interior contains about 500 rooms for the accommodation of about 1,500 officials; the number of the latter has increased considerably since the buildings were first planned. In general the aim of the planning has been to provide large, airy rooms for the use of two or three officials, rather than provide a large number of small private rooms. The Local Government Board Department occupies the Parliament Street and Great George Street fronts; the Education Department is situated on the Charles Street side.

The principal entrance opens into a spacious hall, the ceiling of which is upheld by monolith Mazzano columns. The Mazzano marbles obtained from the quarries at Brescia have soft, warm colours. The principal entrance hall leads directly to the grand staircase, carried out entirely in Mazzano marble, giving access to the principal floor. Directly opposite to the staircase on the principal floor is the audience room, where the President of the Local Government Board receives deputations. This, with its pilasters of pavonazzo marble, and an enriched plaster ceiling, and the board room of the Education Department, are the most elaborately-decorated apartments in the building. The whole of the interior woodwork has been executed by the general contractors, including the panelling in the principal rooms, the doors, teak window frames, and the fine pair of teak doors at the entrance. The Ministers' rooms and those of the principal permanent officials have

DESIGNED BY THE LATE JOHN BRYDON: COMPLETED BY SIR HENRY TANNER, I.S.O.

been more plainly fitted with fine wainscot, and have enriched ceilings; but the other offices, and the interior generally, are of a plain character, as befits an office building, and the walls are for the most part painted in soft green shades. The present President of the Local Government Board having stipulated for plenty of book-shelf accommodation, two large book-cases have been erected in his room as part of the general scheme of decoration, and the same satisfactory arrangement has been carried out in several of the other rooms.

The whole of the engineering work has been executed under the direction of Mr. E. G. Rivers, I.S.O., M.Inst.C.E., Chief Engineer to the Commissioner of Works.

Kitchen and refreshment rooms have been fitted up in the top floor of the building for the accommodation not only of the two departments housed therein, but also for the Home Office officials.

THE NEW PUBLIC OFFICES, WESTMINSTER. DESIGNED BY THE LATE JOHN BRYDON: COMPLETED BY SIR HENRY TANNER, I.S.O.

THE HAMBURG-AMERIKA LINIE BUILDING, LONDON.

Erected by the Disconto Gesellschaft, the main portion of the ground floor and basement of the Hamburg-Amerika Linie Building, 14, 15, and 16, Cockspur Street, S.W., is now occupied by the latter company for their enlarged offices, the remainder of the building being available for letting as offices—to be divided into suites to tenants' requirements.

The building, which is of seven storeys and is of steel construction, stands on two different properties, and the main setting out has been unalterably determined by the conditions of the site, the requirements of the freeholders, and the exigencies of the light and air of the adjoining properties. The upper part of the facade is carried out in Portland stone. The main shipping office is about 75ft. by 40ft. by 18ft. high, and is treated as one large room, the left-hand side devoted to the cabin, and the right-hand to the tourist departments, with the cashier in the centre. Behind the cashier's department are the telephone cabinets and the typewriters. In the basement beneath the main shipping office are the baggage room, with strong room, goods lift to the back street, and extra office accommodation, lavatories, etc. The manager's room in connection with the main office is, approximately, hexagonal in shape, and has a domed ceiling; the walls are lined with panelling, painted white, with a marble fireplace.

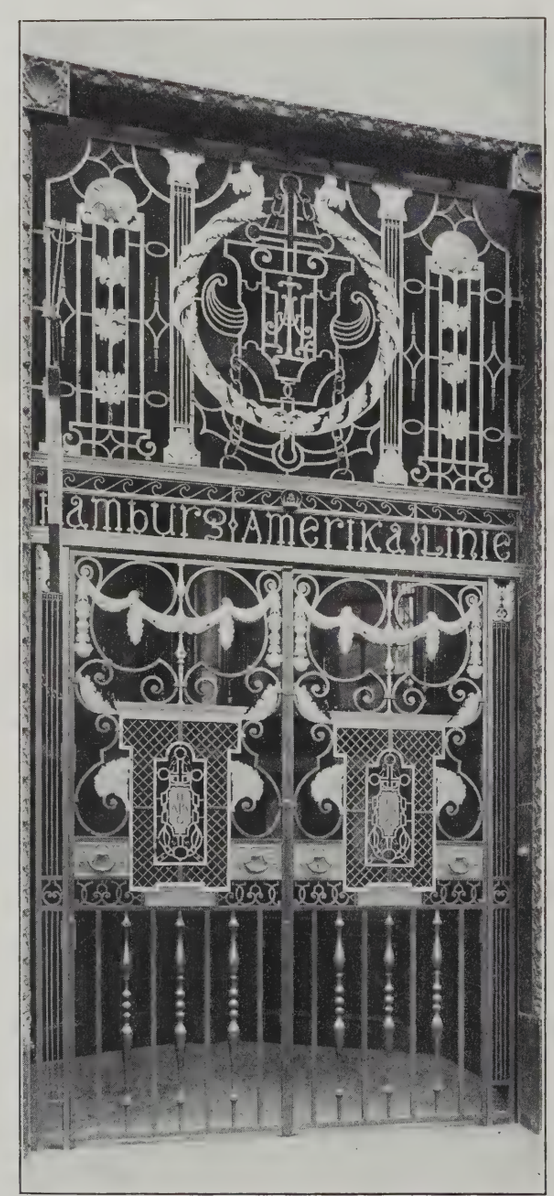

Photo: Bedford Lemere.

WROUGHT-IRON AND GILT GATE.

The main office ceiling is of modelled plaster of considerable scale and relief; the walls are panelled 11ft. high in choice Cuba mahogany with specially selected veneers in the upper tier of carved panels. The dividing pilasters are inlaid with mother-of-pearl of selected colouring, and the caps and bases of the secondary pilasters are of ormolu. The mahogany is of natural colour, polished but not stained, and is of golden yellow-brown in colour. There is a frieze of modelled plaster 6ft. deep above the panelling, the principal bays having ovals representing by figure composition the four Continents.

All the modelling has been carried out by Mr. Schacht from the architects' drawings, and the casting was executed by Mr. Aubrey. The central columns on the dividing line of the properties are of steel encased in concrete, and have been finished on the solid with superfine Keen's cement and polished by Mr Minshull to a white marble face, the bases being finished black, while the caps are gilded and in part burnished.

All the elaborate joinery fittings and furniture have been carried out from the architects' drawings, and Mr. Raymond has been responsible for the solid mahogany carving. The mother-of-pearl inlay was supplied and cut by Mr. Lucas. The floor is of interlocked indiarubber, laid out in white bands with a solid black filling, and has been executed from the architects' designs.

Irish green marble from Connemara has been used in the fireplace in combination with pavonazzo and Italian Brescia. The large and elaborate chandeliers and other fittings, the ormolu and bronze screens, door-plates, etc., and the large wrought-iron screen and gates to the main entrance, and also the balcony railings, have all been executed from the architects' drawings.

The external bronze work, including the large panel with life-size figures over the entrance to the shipping office, was modelled by Mr. J. Wenlock Rollins. The work occupied about eighteen months, and the total cost approaches £50,000. The general contractors were Waring and White, Ltd. The following were some of the sub-contractors:—

Norwegian granite: J. Whitehead and Sons, Ltd. *Joinery (deal and hardwood)*: Waring and Gillow, Ltd. *Mother-of-Pearl inlay*: Mr. Lucas. *Modelled and cast decoration*: Schacht and Aubrey. *Paving*: The British Doloment Co., Ltd. *Concrete staircases and cement floors*: Stuart's Granolithic Co., Ltd. *Electric wiring*: Beaven and Sons, Ltd. *Heating*: Nicholson and Co. *Bronze screens anud wrought iron work*: The Birmingham Guild of Handicraft. *Cast bronze*: Mr. Burton. *Party wall doors and safes*: Ratner Safe Co., Ltd. *Grate interiors*: Wright and Co. *Hydraulic and electric lifts*: Waygood and Co. *Casements*: Burt and Potts. *Glazing*: Harvey and Ashby. *Show-cases*: Stanley, Jones and Co. *Mosaic floor vestibule*: Burke and Co. *Rubber flooring*: New York Belting and Packing Co., Ltd. *Asphalt flats, etc.*: Thomas Faldo and Co., Ltd. *Painting, etc.*: Waring and Gillow, Ltd. *Hall's washable distemper*: Sissons Bros. and Co., Ltd. *Portland Cement* (Hilton, Anderson brand): Associated Portland Cement Manufacturers, Ltd. *Luxfer Fire-resisting glazing*: British Luxfer Prism Syndicate, Ltd.

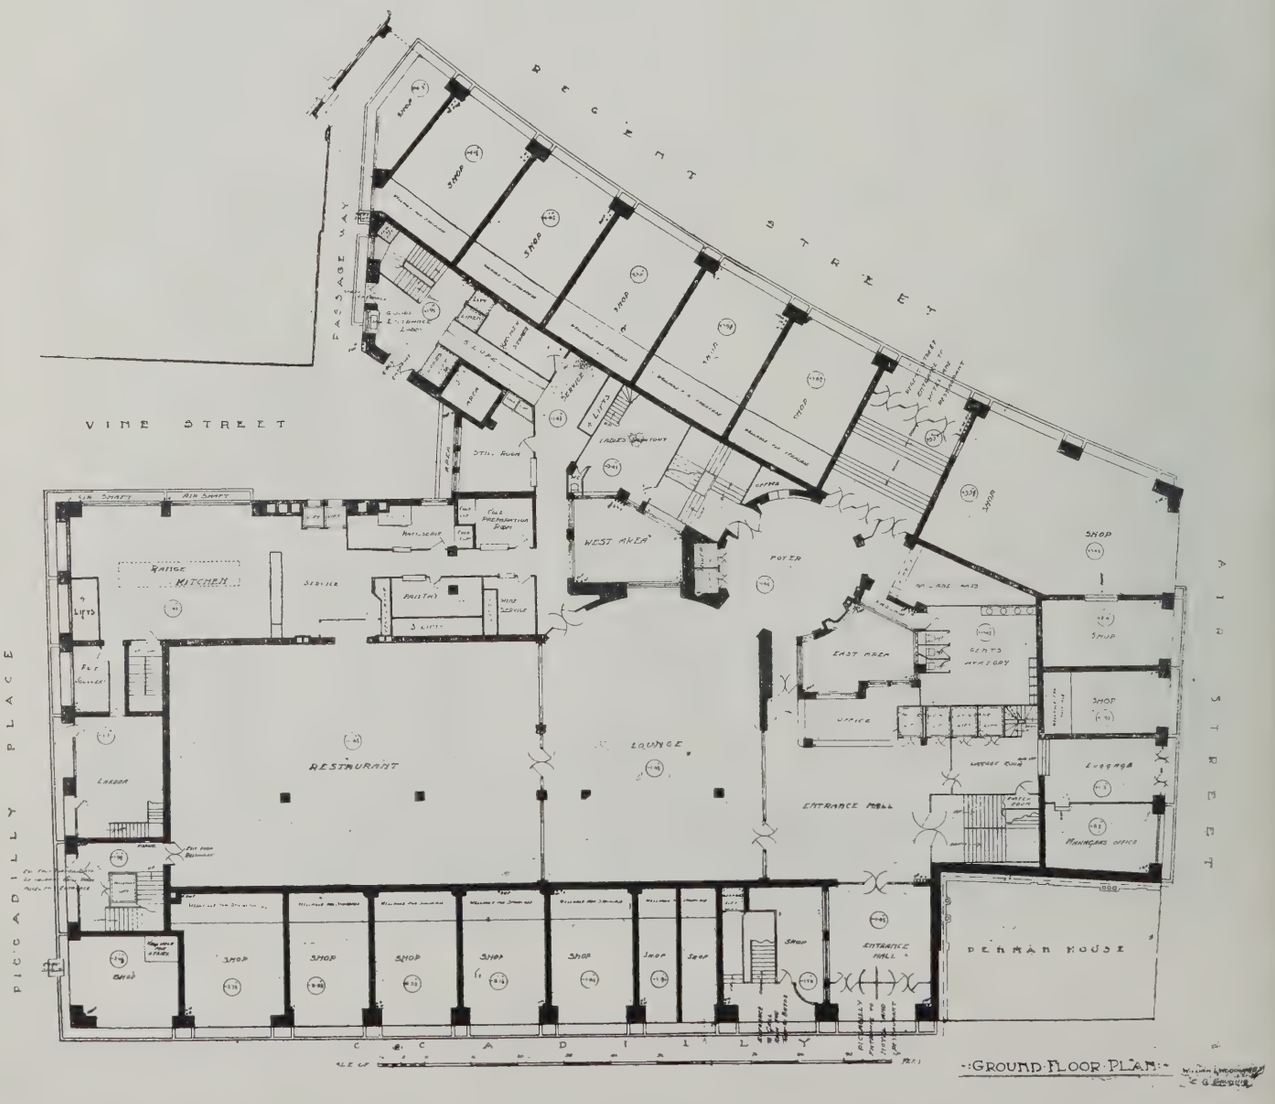
THE HAMBURG-AMERICA LINE BUILDING, LONDON. THE MAIN HALL FROM THE ENTRANCE.
ARTHUR T. BOLTON AND STOCK, PAGE AND STOCK, ARCHITECTS.

THE PICCADILLY HOTEL, LONDON.



The first plans for this building were prepared by Messrs. William Woodward, F.R.I.B.A., and Walter Emden, who were required to work to the exterior design by Mr. Norman Shaw, R.A., as approved by the advisory committee, consisting, in addition to Mr. Shaw himself, of Sir Aston Webb, R.A., Sir John Taylor, and Mr. John Belcher, A.R.A. Mr. E. A. Gruning, F.R.I.B.A., subsequently succeeded Mr. Emden, on the retirement of the latter gentleman from practice as an architect, and Mr. Charles Woodward, A.R.I.B.A., assisted his father and Mr. Gruning.

The foundations extend 40 ft. beneath the street level, giving three underground floors, and ensuring the prevention of vibration from the street traffic. The Turkish and swimming baths are below ground, and can be reached by means of lifts. There are thirty lifts in all—six for passengers, six for goods, sixteen for service, and two hydraulic freight elevators; all but those last named being worked electrically, and all completely equipped with indication, control, and safety devices. The grill-room in the basement, and the restaurant on the ground floor, are 80 ft. by 52 ft. On the first floor there are two dining-rooms, the larger of which is 47 ft. by 32 ft. On the second floor is the terrace, which can be regarded either as a winter garden or as an open-air summer lounge.

The construction is, of course, as perfectly fire-resisting as modern resources render possible. In the steel construction work the stanchions below the ground-floor level are of cast iron, and the superstructure in wrought steel. There are many heavy box girders, some weighing over thirty tons. The roofs necessitated much intricate framing. The stanchions, girders, floors, and roof contain in all from 6,000 to 7,000 tons of iron and steel, and the building as a whole forms a fine example of steel fireproof construction.

The internal decorations represent various styles and periods. In the grill-room the style is derived, but is not slavishly copied, from the galleries of the Palace of Versailles. The wall space is broken up by pilasters having an artistically modelled entablature, surmounted by a cavetto moulding, beyond which the deeply panelled ceiling is painted with clouds and sky. In the billiard-rooms, Norman arcading, pillars with cushion capitals, and trophies of ancient arms, give an effect that is at least quaint, if somewhat out of keeping with the assentially modern tables, cues, and shaded lamps.

The ladies' drawing-room is in Marie Antoinette style, in grey and gold, with sprays of painted flowers on the walls, and amoretti sporting with garlands on the domed ceiling. The large dining-

GROUND FLOOR PLAN.

room and adjoining reception-room are decorated in varied shades of cream and biscuit, with restraint and simplicity of ornamentation.

In the Adam dining-room and reception-room a background showing delicate shades of green, rose, and grey lends effect to the characteristic devices of which the brothers Adam have left so many examples. In the private sitting-rooms, and for the bedrooms, many standard styles of decoration and equipment are represented—old English, Georgian, Adam, Chippendale, Sheraton, Empire, and what not.

The all-important kitchen suites have naturally received the fullest possible attention, and represent a model modern equipment, comprising apparatus for cooking, baking, and pastry-making, and specially fitted stillrooms, etc.

The sanitary fixtures include eight sets of lavatory ranges, 135 closets, 61 plunge baths, 32 canopy baths, and four skeleton spray baths. The lavatory ranges are of Sicilian marble. The walls of the lavatories, bathrooms, and water-closets are tiled, and there are five different designs among the ninety-four rooms which are tiled from floor to ceiling. Sanitation of a rather special character is represented by the five suction cleaners, which, absorbing all dust and dirt, and conveying it into the drains, keep the hotel perfectly cleansed from all suspicion of disease germs. The walls of the entrances, Rotunda and foyer are finished with French stone stuc. The decorative work comprised also very extensive fibrous plaster work.

The flat roofs, gutters, and verandahs, also roof tank-rooms, second-floor loggia or terrace to Piccadilly elevation, are covered with asphalt.

The arrangements for heating, ventilation, and electric lighting were entrusted to Mr. Wingfield Bowles. In connection with the electricity installation, more than 4,000 switches have been used. The general contractors for the building were Messrs. Perry and Co.

The architects acknowledge the assistance, in the general supervision of the work, of Mr. H. H. Bartlett, of the firm of Messrs. Perry and Co., whose wide knowledge and experience of building work was invaluable. Mr. H. A. Bartlett also assisted in supervising the general building operations.

The following are some of the sub-contractors:—

Constructional iron and steel work: H. Young and Co., London. *"Cranham" soundproof partitions*: J. H. Sankey and Son, London. *Fireproof floors*: Frazzi Fireproof Construction, Ltd., London. *Artesian well*: Isler and Co., London. *The whole of the Portland stonework*: F. J. Barnes, Isle of Portland. *Heating, hot water, and ventilation*: Z. D. Berry and Sons. *Electric wiring*: Blackburn, Starling and Co. *Ornamental iron-work*; Hardman, Powell and Co., London and Birmingham; W. Miller and Sons, Wolverhampton. *Mosaic work*; Diespeker, Ltd., London. *The marble work to the principal staircases*: Fenning and Co., London. *Marble work*: J. and A. Crew, London. *Tiling*: George Woolliscroft and Son, Ltd., Hanley. *Baths, lavatories, w.c.'s*; Doulton and Co., London. *Conveniences*: George Jennings, Ltd.., London. *French stone stuc and decorative plaster*: Henry Johnson and Sons, Liverpool and London. *Decorations and furnishing*: Goodalls, Ltd., Manchester. *Cooking apparatus*: R. Crittall and Co., London. *Electric passenger goods and service elevators, also Hydraulic freight elevators*: Otis Elevator Co., London. *Stairtreads*: Metallic Paving and Artificial Stone Co., London. *Fire appliances*: Wm. Rose Hose Co., Manchester. *Power for lifts, fire hydrants, etc.*: London Hydraulic Power Co. 4,000 *"Diamond H" switches*: Hart Manufacturing Co. *Flat roofs, gutters, verandahs, roof tank rooms, etc.*: The Seyssel and Metallic Lava Asphalte Co., Ltd. *Sanitary fixtures and the whole of the plumbing*: Beaven and Sons, Ltd., London and Gloucester. *Portland cement* (Hilton, Anderson brand): Associated Portland Cement Manufacturers, Ltd., London. *Luxfer fire-resisting glazing and pavement lights*: British Luxfer Prism Syndicate, Ltd., London. *Fibrous plaster work to grill room, restaurant, lounges, etc., and two Adams dining-rooms in compo*: Veronese, Ltd., London.

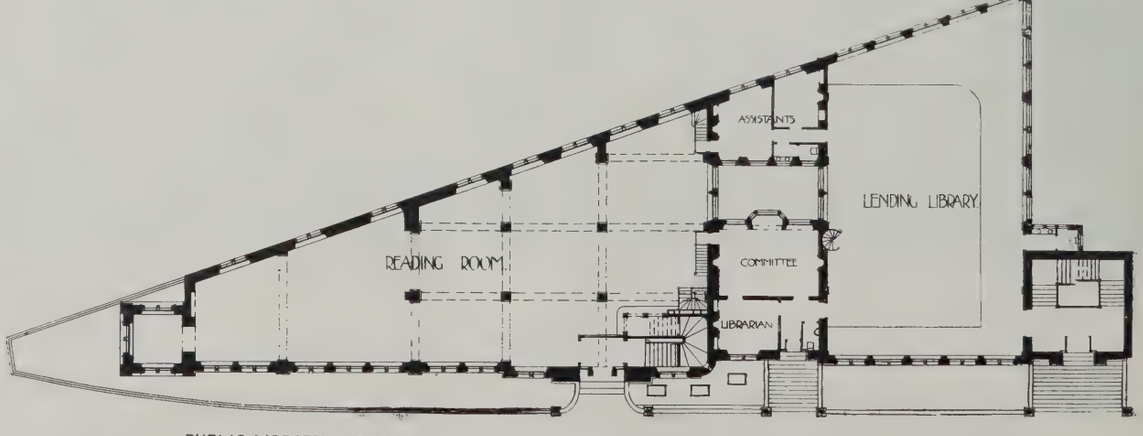
TWO RECENT PUBLIC LIBRARIES.

BRANCH LIBRARY, LONDON ROAD, GREENWICH.

The site of this building is nearly opposite Greenwich Station. The walls had to be carried on concrete arches and piers, as no foundation could be obtained for 6 ft. below the surface of the ground. The front is carried out in rubbed brickwork and Portland stone, the roofs are of concrete and steel covered with asphalt, with the exception of the front roof, which is covered with Westmorland slates. The architects were Wills and Anderson, of London, and the general contractor was F. J. Gorham, of Point Hill, Greenwich. Among the sub-contractors were Henry Hope and Sons, who carried out the casements and fittings and leaded lights; N. F. Ramsay and Co., who supplied the door furniture, locks, etc.; R. Crittall and Co., who carried out the heating and ventilating; and T. Brawn and Co., who made the special gas fittings.

BRANCH LIBRARY, GREENWICH. WILLS AND ANDERSON, ARCHITECTS.

THE ABERDEEN PUBLIC LIBRARY.



The symmetrical portion of the buildings on the right-hand side of the pictures held the original library, opened in 1890 by Mr. Carnegie. It contained three floors of equal area, and provided at the time ample accommodation. The reading-room was in the basement, the lending department on the ground-floor, and the reference-room on the first floor, while off each floor were staff-rooms and other suitable accessories.

After some ten years' experience of the buildings it was agreed to extend them westward. The reading-room particularly was found to be congested, and the stairs to the basement level were difficult to negotiate. Accordingly the whole of the ground floor of the new area was devoted to reading-room purposes. A portion only of the new building was carried into a second storey, and here additional accommodation was found in connection with the reference department.

The style of the extension is in keeping with the character of the original building, and the note of unity has been maintained throughout. Advantage has been taken of the change in the building line and the difference of the floor levels to introduce variety in the details of the front elevation, although these conditions added considerably to the difficulty of designing an addition to an already symmetrical and balanced building.

The front is wholly built of white Kemnay granite, fine axe-dressed, and the roofs are covered with Coniston green slates. The stairs are constructed of Stuart's granolithic steps, and the whole of the furnishings are in American oak.

The architects are Brown and Watt, of Aberdeen, and the following are the contractors for the work:—Mason work, R. Beattie and Son; carpentry, George Jamieson; slate work, George Farquhar; plasterwork, James Simpson; plumbing, James Monro; painting, W. L. Leslie; steel work, J. A. Sangster; heating and electric lighting, Claud Hamilton, Ltd.—all of Aberdeen.

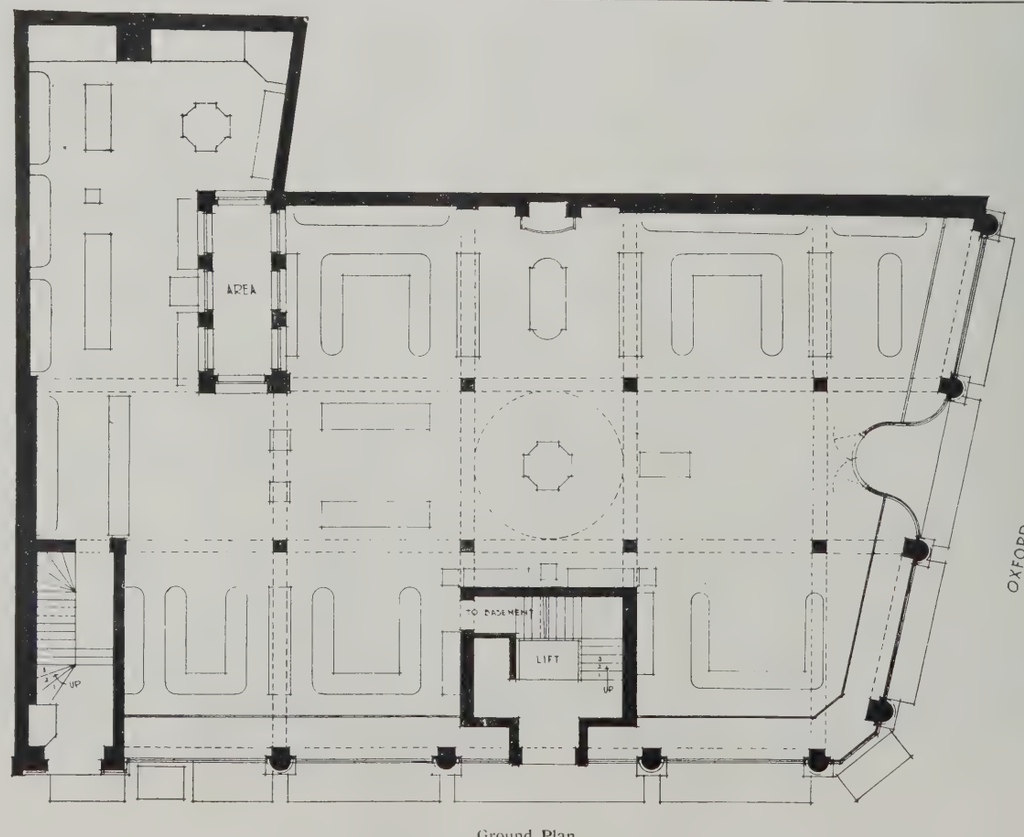
PUBLIC LIBRARY, ABERDEEN. BROWN AND WATT, ARCHITECTS.

NEW PREMISES FOR MESSRS. MAPPIN AND WEBB, OXFORD STREET, LONDON.

This building, which has been erected for the West End showrooms of Messrs. Mappin and Webb, is faced externally with Pentelikon marble, which is obtained from the quarries near Athens from which material for the Parthenon was obtained. The columns on the front are monoliths 20 ft. in length. The fronts on the ground and mezzanine floors are entirely of bronze.

The greater portion of the new basement was executed before the old building was destroyed and while business was going on in the ground and upper floors. This necessitated shoring up the whole of the old buildings, several pieces of which were very intricate work. The work was so arranged by the general contractors that the business of Messrs. Mappin and Webb was not suspended for one moment. Show-cases were made and fixed in the hoarding with almost as much space as the old fronts possessed. The panelling around walls of board-room, mantles, mahogany partitions, the whole of the joinery and the major portion of the fittings, were manufactured by the general contractors.

The ground floor is occupied by a fine show-room, which covers a space of about 5,400 sq. ft. The walls and columns are faced with Siena and statuary marble, giving a delicate white and gold effect which harmonises with the cases of silverware and jewellery. The ceiling is divided into panels by the main beams, and is enriched with modelled ornament. The eight-armed electroliers in the centre of each panel are of silvered bronze, specially designed. The interior is lighted by a central dome, and the rear portion by stained-glass windows, exhibiting the heraldic arms of the various cities at home and abroad in which the firm has branches. A special feature is the chimneypiece—of marble.



In the basement, for which a special retaining wall was built, are located the strong-rooms, cleaning, packing, and dispatch departments, both for home and export trade, and the general staff accommodation. The basement is lighted by pavement lights.

On the mezzanine floor are the board-room, secretarial and private offices, and the counting house, all finished in fine figured mahogany. The five upper floors are approached by a separate entrance and staircase, with an electric lift. These floors are so arranged that they can either be used as showrooms, or sublet as offices and business premises. They are lighted by steel-framed casements with gun-metal fittings; those on the first floor are of solid gun-metal. The windows occupy the entire space between the marble piers of the facade. The landing, lift, and staircase are separated from the remainder of the building by teak glazed partitions, glazed with fire-resisting glass.

Ample lavatory accommodation, with hot and cold water, is provided on each floor.

The oak parquet floors are of selected Austrian oak. The general contractors were G. Godson and Sons. The following are some of the sub-contractors:—

Pentelikon marble facings: Marmor, Ltd. *Retaining wall to site*: Columbian Fireproofing Co., Ltd. *Floors*: Kleine Fire-resisting Flooring Syndicate. *Tiles*: Craven Dunhill and Co. *Casements and fittings*: Hy. Hope and Sons, Ltd. *Fire-resisting glazing*: British Luxfer Prism Syndicate, Ltd. *Grates and art metalwork; special designs in bronze*: J. W. Singer and Sons, Ltd. *Sanitary ware and fittings*: Shanks and Co., Ltd.; Geo. Jennings, Ltd.; Doulton and Co., Ltd. *Parquet flooring*: Howard and Sons. *Plasterwork (modelled)*: George Jackson and Sons. *Electric light fixtures*: F. and C. Osler, Ltd. *Door furniture, casement fittings, and gearing*: Jas. Gibbons. *Lifts*: Archibald Smith and Stevens. *Show-cases*: Farmer and Brindley, Ltd. *Show-cases*: Harris and Sheldon; H. B. Laister; John P. White. *Pavement lights*: Improved Pavement Lights Co. *Constructional steelwork*: Edward Wood and Co. *Patent partition bricks*: Leeds Fireclay Co., Ltd.

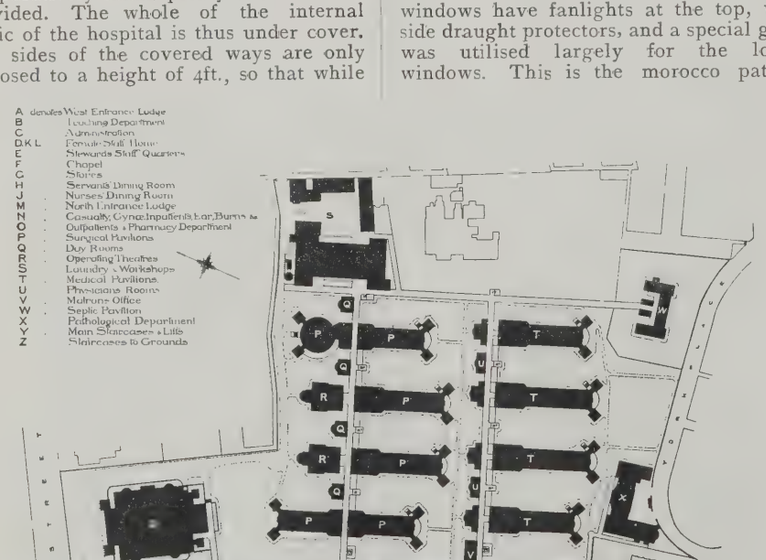
NEW ROYAL INFIRMARY, MANCHESTER.

The new Infirmary buildings which have been erected in Oxford Road and Nelson Street, Manchester, are to be opened by the King early in the new year. The old Infirmary buildings are situated in Piccadilly, but when the question of erecting a new building was proposed, it was decided to do so on an entirely new site, and the present site is largely the gift of the late Sir Joseph Whitworth, to which additions have been made by purchase, increasing its area to nearly 13 acres. For the buildings a competition limited to five architects conversant with hospital work was held, and the assessor, Mr. J. J. Burnet, A.R.S.A., selected the design of Mr. Edwin T. Hall and Mr. John Brooke.

In the new building provision is made for 592 patients and 339 resident officers, nurses, and servants. In all there are forty-eight separate blocks erected at a cost of about £500,000. The general disposition will be noted from the plans. The main frontage to Oxford Road shows the centre administration building flanked by the teaching department on the left hand, and the Female Staff Home on the right. On the Oxford Road frontage is the Out Patients' Department and Casualty Department. Each frontage has an entrance lodge by which all traffic must pass. The whole of the buildings are connected by covered ways, and while the distances separating the blocks are comparatively small, plenty of fresh air is provided. The whole of the internal traffic of the hospital is thus under cover. The sides of the covered ways are only enclosed to a height of 4ft., so that while fully protected by these sides and the overhanging glass roofs from the weather, the air has free access. Under these covered ways are subways in which all the heating, hot-water, steam, gas, and cold-water mains are laid, as well as the electric mains and telephone wires, so that they can be attended to without in any way interfering with the regular traffic of the institution. The wards are built on the pavilion system, with spaces of 60ft. between. Out of the ten pavilions six are allocated to surgical cases, and four to medical cases. Five pavilions have three floors, and the other five two floors, providing in all twenty-five large wards. All the pavilions lie north to south, so that the wards receive direct sunlight. They also lie at right angles to the covered ways, and the distance from the Administrative centre is reduced to a minimum. All the pavilions have open-air space between the lowest floor and the ground. In the basement are the branch mains from the various services, from which vertical pipes ascend direct to the wards. All horizontal pipes liable to collect dirt are thereby avoided. The staircases in all cases extend to the flat roofs, which are available for promenade purposes. Each ward has three small wards attached to it, one for two beds and two for one bed each. There is also a ward kitchen, linen room, and clothes store. The sanitary conveniences are situated in detached towers at the end of the wards. All the windows have fanlights at the top, with side draught protectors, and a special glass was utilised largely for the lower windows. This is the morocco pattern figured rolled glass; while showing obscure pattern, it is smooth on both sid thus fulfilling the sanitary requiremer of the Infirmary Committee.

The floors are of smooth concre covered with linoleum, but Dolome jointless flooring has been used throug out in the small wards. The skirtings a of teak, hollowed out to an easy cur and all wall and ceiling junctions a joined with a curve and painted a varnished. "Gilmour" hospital doo absolutely flat and smooth on both sid and made of polished wainscot oak, ha been used throughout the wards. T wards are heated by hot water, with rad tors hinged so that they can be eas cleaned. In the operating theatre the is a new feature in the shape of a sm gallery to accommodate some twenty-fo students, which is shut off from the oper ing part of the theatre by a plate-gl screen 7ft. high, designed to interce dust, but not to cut off a clear view or t sound of the surgeon's voice. A separ door connects this gallery directly w the lobby. The theatre walls are lin with Sicilian marble to a height of 7 and above with reconstructed marble; t ceiling is glazed with opal tiles, and t floor is of terrazzo. The surgical a sterilising appliances are kept in an anne communicating with the theatre throu an open archway.



The exterior elevations are faced w red brick and Portland stone dressin The stained-glass window in the cha was given by the general contractors, a the frontal and curtains of the chapel w the gift of Mr. Edwin T. Hall.

The general contractors were Mess Harold Arnold and Son, of Doncast

ADDITIONS TO THE GOLDSMITHS' COLLEGE, NEW CROSS, LONDON. REGINALD BLOMFIELD, A.R.A., ARCHITECT.

ADDITIONS TO THE GOLDSMITHS' COLLEGE, NEW CROSS.

These additions, which have recently been completed, consist on the ground floor of five class-rooms, a large art room, and a large room for nature study. On the first floor are two rooms for crafts, a costume-life room, a design room, museum, and nature-study room, the head art-master's room, lavatory, and cloak room. On the second floor are two rooms for crafts, lecture room, nude-life room, higher-painting room, three modelling rooms, and casting room, with lavatories, etc. The facings are of red brick, with Portland stone dressings, and the roof is covered with Westmorland green slates. The older building, described in one of the Sunday papers as a charming Georgian building, was, in point of fact, built about 1840, and formed an indifferent example in brick and stucco of the heavy classic of the time. The general contractor for the new work was J. Carmichael, of Wandsworth. The sanitary work and heating was carried out by Burn Brothers, and the carving was executed by W. Aumonier and Son to the designs and under the supervision of the architect, Mr. Reginald Blomfield, A.R.A.

THE NORWICH UNION SOCIETY'S HEAD OFFICE, NORWICH.

This building, designed by Messrs. G. J. and F. W. Skipper, has been carried out in selected stone from the Clipsham Quarries, except the two statues, which were executed in Portland stone.

With regard to the interior, the requirements included a large general office, as well as many other smaller offices. The general office has been made the chief feature of interest, the other offices being placed around it. The necessity for providing ready access from this central domed hall to the other rooms suggested an open colonnade on the ground floor, and on the upper floor corridors are arranged giving access to the rooms occupied by the directors (board and committee rooms, etc.) on two sides, and the two other sides by offices.

The whole of the interior of the central hall has been carried out in marble from floor to ceiling. The columns, which are all structural, are monoliths of cipollino and verde antico marble. The caps and bases are in white statuary. The entablature is of alabaster, and the lining of the walls is of Skyros marble of a deep red veining below the impost moulding, and above the impost moulding of the greyer description of veining. The spandrels above the arches are panelled out with white marble used for the surround, and cipollino and porphyry-coloured rosso antico fill in the oblong panels; the cornice is in alabaster. The whole of the ceiling has been executed in plaster and painted. The floor for the chief part is polished marble, except where the clerks stand, and there the floors are laid in oak parquetry.

The interior of the hall is lighted by electric lamps hidden in flat bronze basins and behind the cornice in the dome, so that the light is reflected to the ceiling, and the glare of the lamps is entirely avoided. The desk lamps for the clerks are screened by green silk shades, so that every precaution has been taken to ensure the successful lighting of the building and the protection of the eyesight of the workers. Fresh warmed air enters this part of the building through a specially designed opening or fountain in the centre of the hall, and is dispersed by a canopy suspended immediately above it from the centre of the dome; surmounting this canopy is a suitable bronze figure, the work of H. C. Fehr. Two bronze sculptured subjects have been placed in panels in the vestibule under the titles "Solace" and "Protection," with special reference to the objects of the society.

Mr. J. Hurn, Norwich, was contractor for the foundations, and Messrs. G. E Hawes and Son, Norwich, were general contractors for the superstructure. The following were some of the sub-contractors :—

Constructional steelwork to dome, hollow brick floors to flat roofs, and asphalte: Homan and Rodgers, London. *Stoves, grates, and mantels*: Longden and Co., London; Artificers' Guild, Ltd., London. *Oak wood block flooring*: Art Pavements and Decorations, Ltd., London. *Marble work, staircase, and floors*: Farmer and Brindley, London. *Electric wiring, bells, and telephones*: Drake and Gorham, Ltd., London. *Fibrous and modelled plaster*: G. Crotch, Norwich. *Special woodwork and carving*: H. H. Martyn and Co., Ltd., Cheltenham. *Stained glass and leaded lights*: A. J. Dix, London; W. J. Neatby, London. *Painted frieze in directors' luncheon room*: W. J. Neatby, London. *Electric service lifts*: R. Waygood and Co., Ltd., London. *Cut metal work and electric light fixtures*: The Artificers' Guild, Ltd., London; J. W. Singer and Sons, Ltd., Frome. *Door furniture, etc.*: Jas. Gibbons, Wolverhampton. *Heating and ventilating*: James Keith and Blackman, Ltd., London. *Safes, strong room doors*: Milner's Safe Co., London. *Lightning conductors*: Gray and Co. *Luxer fire-resisting, glazing, and pavement lights*: British Luxfer Prism Syndicate, Ltd. *Fire-resisting floors, ceilings, and roofs*: Mark Fawcett and Co., London.
